Suddenly on Dec. 9 the British struck west and two days later reoccupied Sidi Barrani. Striking with a powerful force of mechanized troops they shattered the Italian armies, took some 40,000 prisoners and by Dec. 16 had retaken Sollum, virtually the frontier. They immediately crossed the frontier and invaded Bardia. After a fierce 20 days of long range siege by artillery, naval guns and air force, Bardia was taken by assault by the Australians on Jan. 5, 1941. More than 30,000 additional prisoners and great quantities of war material were taken. The loss of between 80,000 and 95,000 troops had made serious inroads on even the large army Marshal Graziani had gathered. The morale of his men was reportedly low, according to some advisers, because the men felt their navy had deserted them. The Italian people and army had been told such triumphant stories of Italian control of the Mediterranean that its utter uselessness in the North African campaign, either as a fighting force or to control supplies, very likely had a most depressing and even demoralizing effect.

ing influence on the troops.

Beginning with the utter passivity of the Italian fleet while the British under Vice-Admiral Somerville were shooting the naval terms of the armistices to ribbons at Oran, right to the end of the year 1940, the performance of the Italian navy was the most inglorious record of Italy's very inglorious first six months of war. Although the Italian duce and various spokesmen in the Italian press made repeated and sweeping claims that the Mediterranean was already truly Italy's "mare nostrum," the British complained that they were unable to bring the Italian fleet to action.

Various minor items of news from time to time seemed to throw some doubt on the complete accuracy of the Italian claim, when they announced "successful" aerial bombing attacks on British convoys where it was previously understood the British shipping had been swept from the sea. Perhaps the most revealing of these minor incidents occurred during the week of July 20. The Italian cruiser, "Bartolomeo Colleoni," in company with another Italian cruiser encountered the Australian cruiser "Sydney" and a small destroyer escort off the island of Crete. The Italian ships were modern and the "Colleoni" was rated as one of the fastest cruisers in any navy. Both Italian ships sought to avoid action, but the "Sydney" closed with the "Colleoni" and sank her. The "Colleoni's" sister cruiser apparently made full use of this opportunity to effect her escape, for the "Sydney's" captain, after having the final destruction of the defeated Italian ship to his destroyers, along with the rescue of the Italian survivors, was obliged to report later that he had been unable to overtake the other Italian cruiser.

This naval war in the Mediterranean was as much an air war as one of surface naval craft. More and more the Italians depended on their air force to make raids on the British fleet units, particularly those in the harbour of Alexandria. As week followed week in the unsuccessful British effort to seek out the Italian fleet and force it to accept a general action, the British themselves had to turn to the fleet air arm.

An important part of the Italian fleet was eventually located in the inner harbour, Mar Piccolo, at Taranto. One moonlight night in mid-November, the British planes came over Taranto and attacked, principally with torpedoes. When the attack was over, the British claimed that one 35,000-ton battleship had been partly sunk, one—possibly two—23,600-ton battleships had been reached, two cruisers and two supply ships had been badly damaged. At very nearly the same time, other surface units of the British fleet attacked an Italian convoy bound for Albania in the Strait of Otranto. Following a similar attack only a day earlier on another convoy en route for Libya, the conclusion was inescapable that the Italians had lost control of the Mediterranean passages (if they had ever held it).

These developments carried most important implications for the outcome of the two major land campaigns in which Italy had by now simultaneously involved herself, in North Africa and in Albania. After the loss of Sidi Barrani and the British advance into Libya, Marshal Graziani bluntly laid the blame on his own mechanized inferiority to the British. He had previously been reported to have delayed his advance from Sidi Barrani because of lack of mechanical equipment he had asked from Italy.

In contrast to Germany's position, all Italy's armies in action were separated by considerable bodies of water from their homeland and were operating in theatres of war which offered little or no possibility of replenishing supplies, especially of munitions and equipment. Consequently, any action which threatened to sever the communications of these forces with Italian bases was fraught with the gravest peril, even of complete disaster for these overseas forces of imperial Italy.

As if to give point to this vital lesson, the British fleet, a month after Taranto, actually steamed through the Strait of Otranto and, including battleships, stood off Valona on the Albanian coast and bombarded that important Italian debarkation point with 100 tons of shells. They then returned to their own bases and reported not seeing any Italian warships throughout the operation. Reports that Italian forces in Albania were being reinforced by air gave tacit confirmation to the fact that not only did the Italian fleet not control the Mediterranean, it had even lost effective control of that decidedly Italian lake, the Adriatic sea.

Indeed, 1940's last approach to a general action between the British and Italian naval forces had taken place nearly a month earlier on Nov. 26 off southern Sardinia. Planes having discovered the Italian ships, the British Gibraltar squadron, led by the battle cruiser "Renown," closed in and opened fire at extreme range. The Italians put down a smoke screen and retired toward the shelter of coastal batteries and of land-based bombers. The British turned away and the remaining stages of the action were aerial.

Both sides claimed victory in the fight off Sardinia. Claims of losses were conflicting, the British claiming to have torpedoed one Italian battleship, damaged three cruisers and two destroyers and shot down two planes. They conceded a hit on one of their own cruisers and one plane missing. The Italians claimed they had damaged one British battleship, three cruisers and an aircraft carrier and shot down seven planes. They admitted serious damage to one destroyer and the loss of two planes. Regardless of the conflicting claims of losses, the subsequent course of events in the Mediterranean rather clearly indicated that the British remained in effective control of that sea, and were continuing to seek action, which the Italians were seeking to avoid.

THE ITALIAN FLEET at Taranto was dealt a damaging blow by British torpedo planes on the night of Nov. 11-12, 1940. This photograph of the harbour, taken by a British reconnaissance plane, shows two damaged cruisers (above) surrounded by oil slicks. The British also claimed that two or three battleships and two fleet auxiliaries were disabled

ITALIAN PRISONERS by the thousands filed out of the ruins of Sidi Barrani when the British recaptured this western Egyptian town Dec. 12, 1940, at start of their drive into Libya

Excluding the debated losses in the Sardinian fight, British estimates of respective naval losses of the Italians and themselves had been 1 Italian cruiser, 10 destroyers, 24 submarines, submarine depot ship and 1 store ship; while 3 battleships had been badly damaged, along with 2 cruisers and 2 fleet auxiliaries. The British losses were given as 1 light cruiser, 1 destroyer and submarine.

At the turn of the year, the British naval forces took an active and very effective part in the defeats inflicted on the Italians in Libya, notably in the capture of Bardia. It was notable that with this serious and steadily growing threat to the army of Marshal Graziani, one of Italy's best, strongest and most important, the Italian fleet left the British naval forces entirely unmolested to collaborate with the British land and air forces in the invasion of Libya.

Greek-Italian War in Albania (*Oct. 28 to Dec. 31, 1940*).—Following several exceedingly provocative moves against Greece, including the sinking without warning of a Greek cruiser and killing Greek pilgrims at a religious festival, the Italians on the night of Oct. 27–28 delivered an ultimatum to the Greek government, which was followed within three hours by invasion of that country. Much discussion has since taken place, without definitely settling the matter, as to whether this Italian adventure was part of the axis plan of war, or was a private move on the part of the Italian dictator in an effort to impress his Berlin ally with a greater sense of his and Italy's importance. Whichever was the origin of the attack on Greece, developments to the end of 1940 represented a decided setback to the Italians.

When the attack began, Greece probably had no more than 50,000 effectives capable of being maintained in the field. She had an estimated 600,000 indifferently trained reserves. Her equipment was not standardized and was largely obsolescent. Her air force was estimated not to exceed 200 planes, few of them modern, while her navy has been truly called "microscopic" in comparison with the formidable Italian fleet. At the war's outbreak the Greek navy consisted of 1 obsolescent cruiser, 10 destroyers, 13 torpedo boats and 6 submarines and minelayers.

With this estimate of military strength it would not be surprising that the Italians really believed Greek resistance would be merely nominal, as they were reported to believe. The outside world certainly was as much surprised as the Italian high command, when the Greeks not only resisted, but pushed the Italian armies out of Greece and deep into Albania.

The first few days of the Italian invasion indicated the use of relatively small forces, with no great vigour behind the attack. This supported the viewpoint that the Italian government did not really expect serious resistance. Shortly after the opening days, the Italian military pressure was increased and Italian troops succeeded in advancing into Greek territory at all points along the Greek-Albanian frontier. Particularly in the north did the Italian pressure seem to be strong, where it appeared they were developing a major thrust toward Salonika. It subsequently developed, however, that this advance went considerably further in the Italian announcements than it did on the ground.

What the Greek army lacked in equipment and size was amply compensated in terrain. The invasion road lay through one of the most mountainous, inaccessible pieces of terrain in Europe, with much of the country some 7,000ft. above sea level. Added to this, the Greek soldiers showed splendid fighting qualities. The Italians heralded their real effort with widespread air raids on Greek cities and on the battle areas. Notwithstanding this, their advance began to slow down after the first week and soon came to a standstill.

Another precedent of the larger war was shattered. For the first time since Germany set out on her career of conquest, the

British were able to render appreciable aid promptly to a victim of unprovoked aggression, whose territory they had guaranteed. This first took the form of air reinforcements, followed quickly by landings at various points on the Greek coast and islands.

Up to the end of 1940 the precise extent of the British military aid was not officially revealed. At the outset, it was thought that the British would not be able to spare much from their vital problem of holding Egypt against the menace of Graziani's Libyan army which had reached Sidi Barrani. The completeness with which the British disposed of this menace six weeks after the Greek campaign began suggested that British North African strength had been underestimated, and it is entirely possible that their reinforcements to the Greeks were in like manner underestimated.

Something much more important was involved. The Italian effort, when it failed to succeed, exposed Italy to the menace of vastly increased basing facilities for the British air and naval forces, much nearer Italian cities than anything the British had had before. In this respect the Italians took the same risk in invading Greece that the Germans had taken more than six months before in their Norwegian invasion. In the first case, the invasion succeeded and strengthened the invaders' position both for defence and attack. In the second, the invasion failed and was soon turned into a serious threat to the invader's home bases. It is more than probable, for example, that the disastrous British raid on the Italian fleet at Taranto was at least facilitated by the new bases made available to the British by the Italians' ill-judged gamble in Greece.

Another set of considerations gave weight to the thought the Greek attack was indeed an Italian gamble, not sanctioned by the German command as axis strategy. The most cardinal principle underlying German strategy from the beginning of the war had been not to risk a major campaign on two fronts simultaneously. The swift disposal of Poland in Sept. 1939 had realized this cardinal objective. Obviously, a setback in Greece, guaranteed by the British, would give an opportunity for the British to open up a new eastern front. Clearly, then, if an attack on Greece was to be sanctioned at all, it would have called for the same thorough preparations as had preceded the Scandinavian and Low Countries' invasions. This would have been true even if the German high command had shared the Italian expectations of an easy victory, for the Germans did not take risks of such incalculable magnitude on the basis of hope.

The Italian invasion of Greece had not been under way ten days before it became evident the preparations for it were exceedingly incomplete. This was followed by weeks in which Berlin studiously ignored their ally's plight and semi-official spokesmen in both Rome and Berlin indicated that Germany would not intervene in the Greek campaign. Only after Italian armies had been shattered and thrown back far into Albania and while the British attack on Graziani's army in North Africa was gaining momentum, did the Germans at last move to assist Italy during the last two or three weeks of 1940.

Within less than one month after the Italians had crossed the Greek frontier, not an Italian soldier remained on Greek soil. The Greeks had launched a vigorous counteroffensive and had taken an important Italian base at Koritza, Albania, to be followed in the next two weeks by the fall of Argyrokastró, Porto Edda (Santi Quaranta), and other bases. At the close of 1940, the Greeks were in possession of approximately one-fourth of Albania and had evicted the Italians from every port of debarkation except Valona (Avalona) and Durazzo, both of which had been heavily bombed and bombarded by British and Greek planes and warships.

Co-operating with the British air and naval forces, the Greeks

had swept through the Strait of Otranto with their tiny navy and had destroyed Italian transports and supply ships with their somewhat ancient submarines. British air raids against Italian cities, possibly with Greek planes participating, had been delivered on such ports as Bari and Brindisi. In addition, heavy British air raids on the other side of Italy at Naples and other south Italian points had illustrated the new risks Italy had brought on herself by enabling the British air force to establish bases on Crete and other Greek islands. Whereas before the attack on Greece, the R.A.F.'s nearest bases at Alexandria and Cyprus had been about 1,000 mi. distant, now they were only 300 to 600 mi. away.

The veteran Italian chief of staff, 69-year-old Marshal Pietro Badoglio retired from the Italian command, followed by several leading military and naval commanders. Circumstances suggested that these retirements did not necessarily express lack of confidence in the retiring officers.

There were indications, not conclusive it is true, that these officers had expressed criticism of the fascist policy which had led to the reverses in Greece, Albania and North Africa; the bombing attacks on Italian cities and home naval bases; the growing pinch of the blockade and the prolongation of a war which most Italians had expected to run only a month or so after France fell in June.

It was observed that the official notice of the retirement of these officers was in each case phrased in the unusual form "by a royal decree, about to be signed." From the time fascism came to power, no act requiring the royal assent had ever before been announced until the king's signature was actually on the decree. It was also noted that all the retiring officers had been identified as "king's men"; i.e., more loyal to the House of Savoy than to Mussolini's fascist party and government.

Some observers even inclined to the belief that the belated movements of German troops into Italy might be as much to stabilize the internal Italian situation as to reinforce the Italian armies, now apparently largely cut off from the homeland both in Albania and in North Africa. A very direct invitation to the Italian people to overthrow Mussolini came from Winston Churchill in a radio broadcast, which, it was reported, was broadcast on Italian wave lengths in Italian more than an hour before it was officially given by Mr. Churchill in London. Many read a similar indirect sugges-

tion into a New Year's message sent by President Roosevelt to the United States to King Victor Emmanuel III of Italy. Up to the end of 1940 neither appeal had produced any apparent result.

The Situation as 1941 Began.—Sixteen months of war had seen radical changes on the map of Europe. Nine European nations had fallen completely under either soviet Russian or German domination; two others, France and Rumania, had large areas to invaders and exercised the remnants of the sovereignty under German control; Finland had lost some of the most important regions, although she still preserved her nominal independence.

Commerce between the two greatest consuming areas of earth's surface, North America and the continent of Europe, had been almost destroyed, while to Great Britain the commerce was largely dominated by war needs and carried on through the perils of sea and air attack, which had reached destructive proportions. Commerce between the United States and the principal orient, Japan, had been sharply curtailed by embargoes imposed by the United States on certain war materials, following Japanese adherence to the Rome-Berlin axis.

The year had seen in the military sense the utter discrediting, often seen before in thousands of years of military history, of the theory of the defence as supreme to attack. Once again great and imposing ramparts had proved useless. Just as the hordes of Genghis Khan had made a mockery of the Great Wall of China, so, seven centuries later, the hordes of Hitler's Nazi Germany had overrun the country behind the "impregnable" Maginot line, and had done so with losses throughout the whole campaign less than each side had suffered in single battles of the World War, 1914-18.

The use of the German air arm as long range artillery was a new technique, but the principle of concentrated artillery preparation was basic in Napoleon's campaigns. The daring penetration and wide sweeps of the mechanized forces were at least as old as the cavalry tactics upon which the world-sweep of the Mongols had been based, when the hordes overran Eurasia from the Yellow Sea to the Adriatic. Steel tanks and modern weapons were simply more enduring mounts and more destructive than the raggy Mongol ponies and their hard bitten riders. The British victories in North Africa over the Italians pointedly illustrated that it was correct application of the principles of war through the use of modern equipment which was decisive, and not some semi-mythical prowess attached to German arms.

In the North African campaigns, notwithstanding all that had been expected from air power operating over narrow seas against surface fleet, the principles of Admiral Mahan, of Lord Nelson and of sea warfare back to the days of Rome and Carthage, were again exemplified. As Nelson's frigates defeated Napoleon's conquest of Egypt at Aboukir bay, so the British navy repelled the Italian attempt and opened the road for the Italian disasters in Libya, the keystone of the Italian empire.

Such were the great changes of the first 16 months of war; such were some of the outstanding lessons of those changes. History showed the lessons to be new only in detail; history also indicated that the changes, great as they had been, might be transitory. Germany in 1917 controlled more territory than she did in 1940 and one year later had been reduced below the total area of the German states when Bismarck formed the German reich. Napoleon's empire had been as widespread as the German conquests of 1917, wider than those of 1940, in 1813, and after Waterloo in 1815 had shrunk to France.

With this lesson of the instability of territorial conquest, it was but natural that men looked into 1941 with efforts to pierce the veil of the future and appraise the course of events to come. This has ever been a task as vain as it is alluring, but certain mighty forces had been set in motion by the events of 1939-40 which promised to become more clearly operative in 1941. Analysis of these could be made intelligently and did offer some clue to the probable course of events.

It had become increasingly evident that this war was in very truth a revolution, a war to impose a new order on the world and to destroy the old one. It was notable that, whereas many in the democracies had feared that the "masses" and "labour" would not be loyal, that it was in fact the masses of the British people who resolved to carry the war on after every ally had fallen, while the proponents of peace were found principally among the so-called "upper classes." Here was a profound political and psychological phenomenon of the war and the times.

Hitler himself may have given the best answer, although paradoxically he was pre-eminent in failing to grasp its inner significance. He, the master of mass psychology, had described the crowd as "feminine," as "feeling" its way to great decisions, rather than "thinking." Dimly at first, but vividly as their battered B.E.F. left the lurid beaches of Dunkirk, the people of Britain felt that German victory would mean the end of their

cherished individual liberties, the product of nine centuries of struggle. They neither knew nor cared much about the fine-spun ideological philosophies of democracy and totalitarianism, but they did sense that the very soul of democracy, the thing which alone gave it meaning and made life worth living, was individual liberty and they finally believed Hitler when he said his goal was to destroy liberty.

Where the appeasers of wealth and position could reason their way to some kind of compromise solution, illusory, as logic so often is when dealing with human nature and realities, the masses, moved by instinct, came to the simple conclusion that they were merely offered a choice between living as pauperized slaves, dying slowly as a nation, and dying, but perhaps living, as freemen. This spirit hardened a heroic people to carry through one of the most soul searching ordeals ever faced by a nation. It won from the German press the unwitting and certainly unintended compliment of asking, "Are these English 47,000,000 Churchills?"

This spirit gave to the flesh and blood defences of England a strength which the insensate concrete and guns of the Maginot line had lacked. But more was needed to defeat such an enemy as Nazi Germany and all her modern weapons.

The Emergence of the United States.—That more could only come in decisive measure from the United States, the only great industrial nation still beyond the axis reach. England was a mighty workshop. Her production of weapons as 1940 ended was probably greater than that of the United States, but it had reached its peak. That workshop was at the very doorstep of the enemy. It was concentrated and extremely vulnerable to one of two weapons in which Germany excelled. It was vulnerable both to direct air attack and to indirect attack on the lines of supply of food and raw material which were essential to it. In the last analysis of man power, it could barely match half of Germany's resources, and, even if it had equal man power, at the end of 1940 it had only the precarious toehold on the continent of Europe, under axis domination, which was afforded by the Italian fiasco in Greece and Albania.

Under these circumstances, it was evident that the position of the United States could well be decisive in 1941. Granting that Britain could beat off invasion, which seemed reasonably probable, and could maintain her life under endless air and underseas siege, which seemed somewhat less certain; provided she could do these two things for perhaps six months, perhaps nine months of 1941, then the United States strength, if thrown on her side, would probably ensure the defeat of the axis powers and would certainly make their victory impossible. Through the last five months of 1940, the United States had swung steadily toward the side of Great Britain.

The actual supplies sent to Britain, while substantial, were almost certainly exaggerated—and they were all bought and paid for.

They were not an ally's aid.

Immediately after his election for the third time as president of the United States, Franklin D. Roosevelt made ever more plain his determination to give all possible aid to Great Britain. Toward the end of 1940 he dropped even the qualifying phrase of "all aid, short of war." He interpreted his election as a popular verdict for this, his foreign policy. There was general agreement that a majority of the people did lean in this direction, although probably not so far as the president knew he and the nation would eventually have to go.

The United States began, under a Selective Service act, which was conscription, to raise a huge army with an ultimate potential strength of 4,000,000 men. Ever increasing pressure was exerted to put the nation's industry on a war basis to arm and equip this huge force. Important changes in the command and distribution of the American navy were announced just after the beginning of 1941, pointing clearly to preparation for the contingency of war in both oceans.

The handwriting on the wall of American destiny grew ever plainer—from strict neutrality, the U.S. seemed to be shifting rapidly to an active part in the war.

The president of the United States in a public address cited Adolf Hitler's statements that his, the nazi way, and the Anglo-Saxon way of individual liberty, could not both continue to exist in the world. Having cited these words, the president drew the consequences:

That since America would not yield to nazi ideology, it must prepare to fight.

Exchange Control and Exchange Rates.

These outstanding developments dominated the foreign exchanges during 1940. The most important was the spread and intensification of exchange control. Correlative with this was the elimination of virtually all free exchange markets except New York, while the remaining one became increasingly thin.

Finally, the invasion of the western European countries led to the disappearance of five important currencies from the exchange markets and the inclusion of the invaded areas within the British blockade.

The monetary agreement between Great Britain and France signed in Dec. 1939, was so short-lived as to be barely worthy of note. This fixed the franc-sterling rate at 176½ francs to the pound and established an unlimited clearing account between the sterling and the franc groups of countries. Although with the fall of France this agreement lapsed, the clearing technique continued to be used among the members of the sterling area (the British empire, including mandates and protectorates, but excluding Canada, Newfoundland and Hongkong; also, Egypt, the Anglo-Egyptian Sudan and Iraq).

British exchange control developed rapidly from relatively mild measures at the outbreak of war in 1939 to virtually complete control by July 1940. The earliest of these consisted in the spread, through transfer agreements with various countries, of the clearing machinery to many British payments. Special accounts were set up by each partner, into which all outward, and from which all inward, payments were made in domestic currency at the officially established rate of exchange. One by one these countries after Dec. 1939, entered into such arrangements: Sweden; the Dutch and Belgian colonies; Rumania, Argentina and Brazil; Portugal and Hungary; Greece, Peru and Uruguay; Bolivia; Chile; and Spain.

A second important step in the extension of exchange control occurred in March 1940, when invoicing in foreign currencies was made compulsory for British sales to non-sterling areas of wheat, tin, furs, rubber, jute and manufactures thereof, together with the sale to the exchange authorities at the official rate of foreign currency thus made available. This measure drastically reduced the foreign demand for free sterling. Since steps were not taken simultaneously to cut down the supplies allowed to reach the free

market, the free sterling rate fell promptly from \$3.90 to \$3.72 $\frac{1}{2}$ and by the end of March to \$3.45 $\frac{1}{2}$.

Early in June another sharp extension of exchange control was announced, effective July 17. Not merely specified commodities, but *all* exports to the United States and to Switzerland were to be payable only in dollars (or Swiss francs) or in official sterling. Any co-operative arrangements with the Federal Reserve authorities and with American banks a system of "registered accounts" (opened with British banks in the name of American banks or large enterprises) was established to handle payments in official sterling.

While the demand for free sterling was thus being reduced, the supply side of the market was likewise being effectively strangled. The issue of licences for the sale in the United Kingdom of foreign-owned British securities was prohibited, while current commercial and financial payments to the United States and Switzerland were made eligible for foreign exchange at the official rate.

All that remained of the free market was, on the supply side, previously existing sterling bank balances, and on the demand side, certain debts already outstanding and financial payments to the United Kingdom. Exchange from exports to Britain (subject in any event to British licensing) *could* be sold on the free market, but *would* be only if the free rate were as high as the official rate. Thus free sterling became "an emptying pool receiving no replenishment." As a consequence of these measures, the free rate recovered from the historic low of \$3.00 reached on May 10, 1940, to an average of \$3.60 in June and to parity with the official rate by September. The only other steps of moment in the intensification of British exchange control were the prohibition, on Aug. 27, of the import of Bank of England notes into the United Kingdom, and the banning (October) of the import of bearer securities except when permitted by the Foreign Exchange control.

Except where they applied specifically only to the United Kingdom, the aforementioned measures affected the entire sterling area. They were supplemented in various ways by the individual dominions or colonies.

The free exchange rates of Australia and New Zealand, which were depreciated relatively to the pound, fluctuated with sterling throughout 1940. The Indian rupee and the Singapore dollar, on the other hand, after fluctuating fractionally during the early part of 1940, were in April pegged at a rate corresponding to official sterling. The Union of South Africa, as the major gold producer, confronted with a strong demand for her currency, to avoid rapid exchange appreciation established a controlled rate (\$3.98) in February of the same year.

Although not technically a member of the sterling bloc, Canada introduced similar controls over her foreign payments and confined the "free" market principally to the tourist trade. In March 1940, a regulation was issued requiring all exports to be paid for in foreign currencies. The consequent reduction of the demand for free Canadian dollars accounted for the sharp discount which immediately appeared in New York. In April, payment for all imports obtained through the United States was required in the country of origin, thereby substituting for the most part the use of sterling in place of dollars. Residents of Canada were ordered to sell all foreign currency holdings in their possession to authorized dealers.

In July, exchange available for pleasure travel in the United States was made subject to application to the Foreign Exchange Control board and the maximum monthly amount of foreign exchange purchasable without licence was fixed at \$100, later in the month being reduced to \$25. Finally, a further saving of dollars (U.S.) estimated at \$5,000,000 to \$6,000,000 a month was

effected in December, when parliament passed a bill suspending imports from the United States of virtually all luxury manufactures. (Simultaneously, a parallel bill imposed a 25% excise tax on similar Canadian manufactures.)

Developments bearing upon the European exchanges followed three main lines: the disappearance of the currencies of the invaded countries from the world's markets, efforts of Germany to create a continental economic bloc and a general tightening of exchange controls in the non-invaded countries. New York ceased quoting the French franc, the belga and the guilder on May 10. Balances of the invaded countries in the United States were promptly frozen as they had been in Great Britain and quite widely in Latin America. The United States later also blocked accounts of the Bank for International Settlements, Rumania and the Baltic countries taken over by the U.S.S.R. The state department soon authorized the minister of the Netherlands to operate all accounts of his government, while in October the treasury released sufficient French funds to finance all their diplomatic establishments in the western hemisphere.

German moves to consolidate Europe economically which are of interest here included the establishment of an exchange rate of 20 French francs and 132.70 gulden to the reichsmark, the incorporation of Bohemia-Moravia in a reich customs union with the lifting of all exchange restrictions and the free exchange of money at ten Czech crowns per reichsmark, the signing of a clearing agreement with France to cover all except special payments and the establishment of clearing arrangements centring the trade of Italy, Yugoslavia, Greece, Finland, Norway, Sweden, Switzerland, Holland and Belgium with non-German countries through the *Deutsche Verrechnungskasse*.

The general intensification of exchange control may be illustrated by developments in four countries. Rumania in a decree of March 3 abolished the free exchange bourse and established a new official rate for all free exchange. (*See* table on p. 274.) Turkey attempted to regularize her extremely complex trading arrangements by decreeing that all trade with countries not making payment in free exchange would be subject to clearing, all trade with free exchange countries subject to uniform exchange premia (compensation trade). The official exchange rate, which was at \$0.71 at the end of June, was raised by the end of September to \$0.75. Even Switzerland introduced mild measures of control. A gentlemen's agreement between the Swiss National bank and other Swiss banks limited the use of foreign exchange to imports, while the transfer of foreign funds (excepting those of foreign banks) deposited after May 10 was made subject to the approval of the National bank. In Sweden, the foreign exchange law of June 7, 1939 establishing exchange control became effective from Feb. 26, substituting formal for informal controls. Foreign exchange was made available only for specified (chiefly commercial) purposes, the transfer of kronor to foreign accounts was restricted, balances other than demand deposits were blocked and the import or export of bank notes was prohibited except under licence.

Western Hemisphere.—In the western hemisphere Canada was by no means the only nation to adopt controls. Even the United States, through the limited use of export licences and the subjection of the blocked balances of the invaded countries to executive order, moved gradually in this direction. But it was in the Latin American countries, to whom the loss of markets subsequent to German conquests in Europe was a serious blow, that extension of exchange regulation was most rapid. Chile—which even at the beginning of 1940, in common with many of her sister nations, rigorously allocated available exchange to one of several distinct markets—by steps taken in July and September removed upwards of \$2,000,000 from the export draft market by

¹Bulgarian premium for payment of imports from the U.S. reduced on Oct. 15 from 35% to 25%. ²Rumania: decree of March 3 abolished the free exchange bourse and established a new official rate for all free exchange equal to the old official rate plus 38% plus another 50%, which for the dollar is 211 lei to the dollar, or \$0.47 per leu. ³After June 1 bank rate; Venezuelan free market abolished on that date.

authorizing the sale of exchange arising out of the export of ores and minerals at the "D.P." (nominally "free") rate of exchange. Purchase of an equivalent amount of import drafts at this higher rate was thus made obligatory. Colombia modified its exchange control system by granting increased powers to the Exchange Stabilization fund and further restricting the uses of exchange. Ecuador, hitherto without controls, introduced regulation in June, when the Central bank alone was authorized to conduct transactions in foreign exchange at an official exchange rate. After the invasion of western Europe, Peru called for and secured the voluntary limitation of sales of foreign exchange by the banks without being forced to adopt more strenuous measures.

Venezuela, after first tightening control measures so as to reduce the exchange made available for non-commercial payments, toward the end of June abolished the free market altogether and extended control to include all transactions. By the year's end, the only countries of Central and South America without formal exchange control were the following: Cuba, Dominican Republic, Guatemala, Haiti, Mexico, Panama, Peru, El Salvador. Even in most of these, considerable delay in the provision of dollars was frequent.

As for Latin American exchange rates, the generally increasing weakness until midyear reflected the steadily worsening position of their balances of payments resulting from the extension of the blockade to the invaded countries. Rates quoted on Brazil and Chile were steady all year owing to the exercise of controls. From July, the recovery of the Argentine "free" peso reflected a number of separate influences. In June, the \$20,000,000 credit from the Export-Import bank was a strengthening factor; in the autumn, the converging effect of repressive measures against United States products, of a \$100,000,000 British meat contract

and of the inflow of large amounts of dollar funds and securities from the Balkan states and Switzerland, led to the appreciation of the free rate until by mid-October it was below the official rate. Bolivia, with three rates of exchange extant—the controlled, the compensation and the curb rate—effectively checked and reversed a sharp drop in the curb rate by a diversion of exchange allocations from the controlled market to the compensation market, an increase in the compensation rate from 53.4 bolivianos to the dollar to 70 and a contraction of credit. Rapid recovery of the curb rate permitted a reduction of the compensation rate in early August to 58.

Between late July and Nov. 1940, Ecuador by successive reductions brought her official rate of exchange down from 18 to sucres to the dollar, accompanying this action with a restriction of exchange allotments. The steadiness, after June, of the Peruvian sol and the Venezuelan bolivar reflected, in the one case, the introduction of informal controls, in the second, the abolition of the free market.

Mexico, with no exchange control other than the occasional limitation of the supply of dollars made available and official support of the peso, experienced in Dec. 1939 a sharp increase in the demand for dollars, leading the Bank of Mexico to discontinue its support to conserve its reserves. The peso-dollar rate rose from 4.90 to 5.85 (\$0.204 and \$0.171) by mid-December, with demand still far exceeding supply. This lower rate for the peso was maintained through May 1940 by the use of the stabilization fund and by credit restriction, after which it showed strong recovery until the end of the year. A capital movement from the United States in June which increased exports to that country, together with the continuance of the aforementioned measures permitted the Bank of Mexico to lower its buying rate to 5 pesos per doll

during June, after which it was able to allow the peso to seek its own level.

The Orient.—In the orient, Japan's exchange control was maintained and during November strengthened considerably. Because of the sharp depreciation of sterling during May the yen-sterling rate was temporarily suspended, banks being allowed to fix their own rates. Throughout 1940 the yen continued pegged to the dollar at 23.44 cents.

The support accorded the Shanghai yuan from mid-February was abandoned at the end of May by the Anglo-Chinese stabilization committee, owing presumably to the continuing drain of excess imports on the control funds. As a consequence, the yuan dropped during the week ending May 4 from $6\frac{1}{8}$ cents to $4\frac{7}{16}$ cents. Thereafter it fluctuated with the changing fortunes of trade until given strong support by American and British loans. (See EXCHANGE STABILIZATION FUNDS.)

The Netherlands Indies guilder entered the ranks of independent currencies in May, following the collapse of the home country. Adherence to the Allied exchange bloc, a rate of 1.875 to 1.895 guilders to the dollar, and abolition of the free sterling market were announced. At first limited and later (July) complete exchange control measures were instituted. (See also GOLD RESERVES AND GOLD STANDARD.)

Exchange Equalization Account: see EXCHANGE STABILIZATION FUNDS

Exchange Rates: see EXCHANGE CONTROL AND EXCHANGE RATES.

Exchange Stabilization Funds. With all sterling area trade subject to a controlled official rate, the need for exchange stabilization operations by Great Britain disappeared. Thus the important British Exchange Equalization account was virtually inactive during most of 1940. Because of the existence of this controlled rate vis-a-vis the sterling area and because of the disappearance from the exchange market (except for nominal quotations) of most European currencies, the United States Exchange Stabilization fund also discontinued its normal operations in European currencies.

In other directions, however, the use of the U.S. fund and of resources made available through the Export-Import bank (*q. v.*) increased. The stabilization fund early in Dec. 1940 advanced to Argentina and to China \$50,000,000 each for currency stabilization. Out of the \$500,000,000 made available on Sept. 26 to the Export-Import bank for loans to Latin American countries, \$25,000,000 was made available (October) to Brazil to cover exchange needs for purchases in the United States on a revolving basis, \$20,000,000 was advanced to Argentina in June for industrial and transportation development and another \$40,000,000 in December for currency stabilization, while Uruguay received a total of \$7,500,000. China obtained \$50,000,000 for purchases in the United States, in addition to the stabilization loan. Great Britain similarly divided a £10,000,000 loan to China equally between currency support and purchases in the sterling area.

Canada's Exchange Equalization fund on May 1 took over at current market price all the gold and foreign exchange of the Bank of Canada and received in addition from that institution \$325,000,000 from the sale of treasury notes and bills, for working capital. With a controlled exchange rate and with the free rate eventually left to the forces of a constantly narrowing market, operations of the fund assumed a rapidly declining significance.

The Swiss Exchange Equalization fund of 533,500,000 francs was liquidated on April 30, 1940 by a decree of the federal council, being divided between the federal government, the cantons and the national bank. Latin American stabilization funds and central bank resources were heavily drawn upon to support their currencies in the face of generally adverse balances of payments. Replenishment of these resources from U.S. loans, together with a restricted allocation of dollars and extended controls, prevented their exhaustion. (See also EXCHANGE CONTROL AND EXCHANGE RATES; GOLD RESERVES AND GOLD STANDARD.) (P. T. E.)

Exhibitions and Fairs: see FAIRS, EXHIBITIONS, EXPOSITIONS.

Exploration and Discovery. **Arctic.**—In exploration and development of Arctic territories the work of the soviet union continued to exceed all others, both in extent and in variety. During 1940, work in large areas of the non-soviet Arctic was in abeyance because of war conditions. This was particularly the case with Greenland and the Canadian far north.

U.S.S.R.—One of the outstanding events of 1940 was the voyage of the icebreaker "Stalin," which headed north from Murmansk on Dec. 15, 1939, to assist in freeing the "Sedov" from the ice in which it had been drifting for more than two years. Passing west of Spitsbergen, the "Stalin" reached the "Sedov" in the Greenland sea on Jan. 13, 1940. The exact position of the meeting is not available, although it is known that on Dec. 27, 1939, the "Sedov" reported her position as $81^{\circ} 34' 6''$ N. lat., $4^{\circ} 40'$ E. long. By heating the "Sedov's" hull and dynamiting the surrounding ice the vessel was freed, and on Jan. 16 the two ships started south. The "Sedov's" drift had lasted 812 days. After quick reconditioning at Murmansk, the "Sedov" again sailed for hydrographic work in the Kara sea.

During the "Sedov" drift scientific observations were carried on continuously. Preliminary reports show: the depth of the entire central portion of the polar basin is more than 13,000 ft. and in places more than 16,000 ft.—thus falling in line with the 15,367-ft. Stefansson (Storkerson) sounding of 1918, taken near 72° N. lat. north of eastern Alaska, and the 17,850-ft. Wilkins sounding taken in 1927 near 77° N. lat. north of Wrangel island, both of which soundings were at that time considered remarkable because of their excess over 12,631 ft., the greatest depth observed by Nansen on the "Fram" drift of 1893-96. The temperature of Arctic waters has risen considerably between the "Sedov" and "Fram" drifts. The theory of a constant polar anticyclone is considered now disproved; for it is indicated that in summer reduced atmospheric pressure prevails throughout this region.

During the 1940 navigation season thousands of tons of freight were shipped via the northern sea route to the mouths of the great Siberian rivers, consigned to north Yakutai, Kolyma, Chukotka, the polar stations and ports situated along the route. This season, because of difficult ice conditions, vessels from Murmansk and Archangel followed a new route, rounding Cape Zhelanya, the northern tip of Novaya Zemlya. Scouting by planes had shown the sea here ice-free, while farther south stretched nearly unbroken fields. Hydrographic investigations were conducted along the entire 7,000-mi. stretch of the northern sea route.

The use of planes to assist ships in navigation of the northern sea route was extended. During July, August and September aerial reconnaissance was carried out over the Kara, Laptev, east Siberian and Chukotsk seas. An outstanding achievement during 1940 was a flight from Tixie bay to the vicinity of the pole of inaccessibility (determined by Stefansson in 1920 as being near 84° N. lat., 160° W. long.). Another remarkable flight was from Dickson island to a point at 82° N., 83° E.

There was a continuation of soviet geological surveys, some of them specially directed toward discovering new coal and mineral deposits. An expedition on the Chukotsk peninsula surveyed fodder and land acreages with a view to establishing gardening and stock farms.

The broad program of scientific observations was continued at all the established polar stations, with emphasis on study of the upper atmosphere by radiosonde balloons. A number of temporary polar stations were established, chiefly for detailed study of ice conditions at points along the northern sea route.

Canada.—R.M.S. "Nascopie" made its annual patrol of the eastern Arctic, delivering supplies to government and Hudson's bay posts. In addition to the usual stops in Baffin island and elsewhere in the Canadian Arctic, the ship this year visited west Greenland, calling at Thule in the north and Godthaab, the capital. At Ivigtut 1,705 long tons of cryolite were loaded for Canada. Two new radio stations were established—CG5K at Clyde and CG5H at Pond's inlet; station CV7R was transferred from Wakeham bay to Sugluk. At Fort Ross on Bellot strait a new post office was opened which will handle all northwest passage mail.

Hudson's Bay company vessels continued carrying freight and personnel to the company's Arctic posts in the western Arctic. One ship, the "Fort Ross," carried freight from Tuktuk, in the eastern edge of the Mackenzie delta, along the coast to posts as far east as Parry river; other supply boats plied up and down the great northward-flowing rivers of Arctic Canada.

Gold mining in the Mackenzie and Yukon districts, N.W.T., was expected to show a considerable increase over 1939. A number of new mines were being developed; modern and more efficient methods were in use in an increasing number of the old ones.

With 1,700 reindeer born in 1940, Canada's herds in the Mackenzie river district of the western Arctic were 6,635 at the summer count, 1940. These have developed from 2,370 which reached the Mackenzie in 1935 after a drive from western Alaska. In 1938 the herd was divided and 950 animals were turned over to a graduate Eskimo herder who took them east to the Anderson river. In 1940 he had 1,600 head. In the autumn of 1940 a second Eskimo was to receive a herd of 800, driven 250 mi. overland from the main herd, east beyond the Anderson river to the Horton river district. Such herds are given to trained Eskimos under an agreement by which they eventually return to the Canadian government as many animals as they received, keeping the increase as their own property.

Greenland.—Danish sailings to Greenland in the spring of 1940 started later than usual, due to bad ice conditions. When Denmark was occupied by the Germans in April, two Grönlands Styrelse vessels were on their way to Greenland, as well as the cryolite company's "Julius Thomsen," all arriving safely. It was expected that these ships, cut off from the mother country, would be used for coastal navigation and perhaps for sailings to the United States and Canada. Communication between Denmark and Greenland was in 1940 maintained by radio.

On May 10, the U.S.C.G. "Comanche" sailed from New York carrying the first U.S. consular officials ever assigned to Greenland. These were James K. Penfield, consul, and George L. West, Jr., vice consul, who were to establish headquarters at Godthaab.

Early in June the steamer "Nascopie" made a special trip to Greenland, carrying the first Canadian consular officials to be appointed to that country—Kenneth P. Kirkwood, consul and A. E. Porsild, vice consul. The ship carried a cargo of supplies for the use of west Greenland residents who were cut off from their usual shipments from Denmark.

Governor Eske Brun of north Greenland, who headed a trade delegation, announced in New York on Sept. 20 that Greenland's material needs have been assured for 1941 as the result of new

trade channels established with the United States and Canada.

Captain Robert A. Bartlett made his annual cruise in Arctic waters. Leaving New York June 20 the "Morrissey" went to Labrador and Greenland, proceeding through Smith sound, Kap basin, and Hall basin into Kennedy channel, the most northern point reached on the trip—the first time a vessel had entered the area since Peary (and Bartlett) in 1906.

Alaska.—There was little change within Arctic Alaska during 1940, but there is prospect of considerable during 1941. Gold mining was somewhat revived in Arctic camps as in the rest of Alaska, a continuing effect of what Alaskans call "the rise in the price of gold"—the devaluation of the dollar. There were in 1940 tentative plans for half a dozen or more air bases north of the Arctic circle. One may be constructed during 1941 near Point Barrow and perhaps others somewhere between Barrow and Kotzebue. Extensive developments in the air services of sub-Arctic Alaska also threw further tentacles beyond the circle.

In 1940 the United States weather bureau had five stations north of the Arctic circle; while none of these was established during 1940, the number of observations at each was increased and changed as follows: Wiseman, Kotzebue, Barrow increased from two observations daily to hourly observations between 5:30 A.M. and 5:30 P.M., 150th meridian time. Shungak, Point Hope changed from co-operative stations rendering observations on request to paid stations furnishing three scheduled observations daily. In Sept. 1940 the Barrow station was changed to a "first order" station by assignment of two weather bureau experts to take daily upper air soundings and to secure data on humidity, temperature, pressure, wind velocity and direction at various levels above the earth's surface, providing material aid to forecasting weather changes at Alaskan points. At Fort Yukon and Alatna, twice-daily airway weather reports were furnished in 1940. South of the circle the weather bureau had at the end of 1939 21 additional stations located at strategic Alaskan points, furnishing hourly reports during the period 5:00 A.M. to 5:00 P.M., 150th meridian time, and 14 other stations furnishing reports every three hours over the same period. Radiosonde observations similar to those made at Barrow were also made daily at Anchorage, Bethel, Fairbanks, Juneau, Ketchikan and Nome.

The Alaskan branch of the U.S. Geological survey did aerial photography for cartographic purposes covering part of the Porcupine valley and some of the tributary valleys from the south. A map was prepared for early 1941 publication. The chief Alaskan geologist, Philip S. Smith, and several of his staff did extensive work during the summer in sub-Arctic Alaska, chiefly mapping and general investigation of mineral resources, including "defence" minerals. A favourable sub-Arctic Alaskan development was that the defence program called for increasing farm, dairy, garden, chicken ranch and similar production. An unfavourable development was that Japan renounced her sealing treaties, which was interpreted to mean that more seals would be killed over wider areas through a longer season, resulting in a serious decrease of the seal population and corresponding decrease of Alaska revenues.

Antarctic.—The only Antarctic exploratory work in 1940 was that of the expedition of the United States Antarctic service. Planned, two bases were established—west base near lat. 78° S., long. 163° 35' W. (about 4 mi. northeast of the site of "Little America"); and east base near lat. 68° 10' S., long. 67° W. (on a small island in Nyen fjord, Marguerite bay, Palmer peninsula). West base had 29 men under the leadership of Paul A. Siple, as well as the "Snow Cruiser" with a complement of 4 under Alton Wade; east base had 26 men under Richard B. Black.

Between Jan. 11 and Nov. 1 a considerable part of the exploratory program had been completed, and work was proceeding

Above: THE "NORTH STAR," supply ship of the U.S. Antarctic expedition, anchored in Marguerite bay in March 1940

Left: "DOG TOWN" at the east base camp of the U.S. Antarctic expedition in 1940

Below: THE SOVIET ICEBREAKER "Georgi Sedov," which set out in July 1937 to explore a possible 12-month Arctic sea lane, was finally reached Jan. 13, 1940 by the icebreaker "Joseph Stalin" (foreground) after 27 months in a drifting ice jam. In Feb. 1939 the "Sedov" drifted closer to the north pole than any ship had ever been

Highlights of reported accomplishments are: one to four flights in each of the following localities—Marie Byrd land, Ross barrier, Pacific quadrant, Palmer peninsula. The Pacific quadrant flights, Feb. 24, 25 and 27, achieved the major objective of the expedition, the delineation of the unknown coast between 80° and 150° W. longitude. More than 450 mi. of new coastline was charted; also two large islands, three high mountain ranges and a huge bay. Work has been carried on continuously in glaciology, biology, geology, physiology, geophysics, radio, meteorology, cosmic ray.

Congress decided that, in view of the existing national emergency, expedition activities shall be suspended after the 1941 season's operations, and the bases evacuated. Two ships, the U.S.S. "Bear" and the U.S.M.S. "North Star," were (Jan. 1941) enroute to the Antarctic for the evacuation. It is anticipated that this will be accomplished and the ships returned to the U.S. by April 15, 1941.

Whaling.—Whaling in the Antarctic was disorganized by the European war, and little information concerning such operations was available because of disrupted communications.

From the little that is known it is apparent, however, that, of the several nations which formerly engaged on a large scale in Antarctic whaling, the Japanese were the only ones who remained in the field. The largest whaling fleet, the Norwegian, was still in the south at the time of the German occupation of Norway, and its ships were scattered and tied up in neutral ports. The German whalers were held in Hamburg by the British blockade. No British whalers were in the field in 1940, for there was a two-year reserve of whale oil in Britain when the European war started in 1939, and there were in 1940 large quantities in storage in the United States.

In the past the Japanese government has refused to adhere to the international conservation rules. It is, therefore, feared by those interested in the conservation of Antarctic whales that in 1940 the Japanese whaling fleet, consisting of 6 factory ships and 48 attendant boats, made serious inroads upon the whale population, and would so continue in 1941. (See also NATIONAL GEOGRAPHIC SOCIETY.) (V. S.)

Export-Import Bank of Washington.

The Export-Import Bank of Washington was established Feb. 12, 1934, pursuant to executive order. Its capital stock was \$75,000,000, consisting of \$1,000,000 of common stock and \$74,000,000 of preferred stock. The secretary of state and the secretary of commerce were authorized to subscribe to the common stock of the bank with funds obtained from the appropriations made by the Fourth Deficiency act. The Reconstruction Finance corporation purchased the preferred stock. Subsequent legislation con-

ALL U.S. ARMY VOLUNTEERS and conscripts must pass a rigid eyesight test

tinued the bank as an agency of the United States government until Jan. 22, 1947, or such earlier date as may be fixed by the president by executive order.

The bank may have outstanding at any one time loans or other obligations up to \$700,000,000. Its governing body is a board of trustees consisting of 11 members, representing the state department, treasury department, department of commerce, department of agriculture and the Reconstruction Finance corporation.

The purpose of the bank is to facilitate and to aid in financing exports and imports between the United States and any of territories and insular possessions and foreign countries. For the furtherance of said object and purpose the bank is authorized to do a general banking business.

The bank has extended credits to various European countries to China and to South American and Central American countries. These agricultural countries of South America and Central America lost their European markets because of the war. The bank therefore extended credits to the majority of the South American and Central American countries to assist them in the development of their resources, the stabilization of their economies, the orderly marketing of their products and in some cases for the construction of vitally needed highways and public works projects. Substantial parts of these loans were used to purchase American machinery, equipment and supplies and to cover cost of engineering. On Dec. 31, 1940, \$131,031,867 were outstanding in loans and commitments totalling about \$654,000,000 had been made since the establishment of the bank. (W. L. PL.)

Exports and Imports: see INTERNATIONAL TRADE.

Eyde, Samuel (1866–1940), Norwegian chemist, was born on Oct. 29 and was educated at the University of Charlottenburg. After following his profession of engineering for some time he began hydro-electric experiments in 1898. Five years later, with the assistance of an associate, he invented a method of extracting nitrogen from the air. In 1905 he founded a hydro-electric trust which for years dominated the nitrate business of Norway. From 1920 to 1923 he was the Norwegian minister to Poland. His death at Asgardstrand, Norway, was announced by the official German news agency in Berlin on June 11.

Eye, Diseases of. Vitamin Therapy.—The vitamins are increasingly important in ophthalmic therapeutics. Vitamin A has long been known to be connected with vision, a deficiency leading to a type of night blindness. Testing the light threshold by measuring the minimum amount of light which can be seen after the eyes have been subjected to a light of known brightness for a definite time gives a means of estimating the amount of vitamin A available in the retina of the eye. This test can be made by using a sensitive instrument known as a photometer. A high threshold indicates partial night blindness, presumably due to deficiency of vitamin A in the blood. A group of persons with asthenopia or symptoms of eyestrain persisting after correction of refractive errors showed a definite raising of the light threshold. Following oral administration of large doses of vitamin A, 79% of them obtained complete, and 12% partial relief from their symptoms.

Curiously enough, deficiency of another vitamin, riboflavin (B₂), which is in no known way connected with light perception, has been found to cause a similar symptom complex not relieved by adjustment of refractive errors. This vitamin seems to require adequate hydrochloric acid in the gastric juices for proper utilization. Patients with adequate intake but with achlorhydria often develop signs of deficiency. Riboflavin deficiency is manifest

ected by skin lesions such as fissures at the corners of the mouth, eczema, greasy desquamation in the nasolabial folds as well as the scales of the nose and sometimes the nostrils, the forehead and the ears.

Associated with these are found early an engorgement of the small blood vessels at the edge of the avascular cornea of the eye. As the condition progresses these vessels proliferate and invade the cornea beneath its outer layer. Opacities in the superficial layers of the cornea, and later opacities and vascularization in the deeper layers, may develop. These findings associated with photophobia, dimness of vision, a burning sensation of the eyes and visual fatigue are characteristic of ariboflavinosis. Oral administration of riboflavin given with hydrochloric acid, if a deficiency of this exists, results in a prompt healing of the ocular lesions and a subsidence of the symptoms.

Exophthalmos.—Exophthalmos or protrusion of one or both eyeballs is frequently found in association with excessive function of the thyroid gland and with an increased basal metabolic rate of the body. The severest form of exophthalmos may be seen following removal of the thyroid gland, even though the basal metabolic rate is normal or subnormal. A satisfactory explanation of the production of exophthalmos in association with goitre has been lacking until recently. It appears that the changes are due not to the thyroid, but to the pituitary gland. The eyeball is pushed forward by an increase of fluid in the tissues of the orbit outside of the globe. This oedema and exophthalmos have been experimentally produced in guinea-pigs by the injection of an extract of the anterior lobe of the pituitary gland which is high in thyroid-stimulating factor. This was true in normal guinea-pigs and in those in which the thyroid gland had been removed. It was more marked in the thyroidectomized animals.

This indicates that the same hormone that stimulates the thyroid gland causes the exophthalmos and not that it is caused by an overacting thyroid.

Sulphanilamide.—Gonorrhoeal ophthalmia is a serious eye infection most commonly seen in newborn babies, but also seen in older children and adults. Years ago it was one of the most common causes of blindness. Since the custom of instilling nitrate of silver in the eyes of newborns has become prevalent it has become relatively rare. When it did occur it required weeks of hospitalization with constant nursing care. The final result was usually a scarred eye with impaired vision.

Sulphanilamide has been used with such success in this disease that in most cases the infected eyes have been cured in a week or less with relatively little scarring. The mode of action of sulphanilamide is not clear as it has little general antiseptic power when used locally, but seems to be specific for certain organisms. When given internally it apparently interferes with the metabolism of the infectious agent, thereby preventing its multiplication and either allowing it to die or be overcome by the defence mechanisms of the host.¹

Experimental Transplants.—The success of many surgeons in recent years in transplanting a section of cornea from one eye to another brings to mind the work of Dr. Leon S. Stone of New Haven, Conn. For several years he has been transplanting entire eyes in the salamander with a resulting return of vision. He removes the eye and replaces it in the orbit of another salamander and observes the changes which occur. The transplanted eye shows signs of a returning blood supply within 24 hours. The retina of the eye begins to degenerate rapidly and is completely destroyed by the 25th day. However, the amphibians have remarkable powers of regeneration and in about six weeks a new retina has formed. This regenerative power, which is necessary

for return of vision, is one which is lacking in mammals. Attempts at transplanting and reimplanting eyes in the lower mammals have been uniformly unsuccessful. A reimplanted eye existing for about four months, one-fourth its original size, has been Dr. Stone's best result in the white rat. (See also VITAMINS.)

Fairs, Exhibitions, Expositions. In 1940 two major expositions were held in the United States of America, the Golden Gate exposition at San Francisco, Calif., and the New York world's fair in New York city, at which 62 nations distinguished themselves with their exhibits.

These two great expositions were first opened in 1939 and reopened again in 1940. They were being demolished at the close of 1940. The exposition in San Francisco was held on a man-made island of 400ac. in the centre of San Francisco bay. The site of the exposition was being prepared to become the metropolitan airport.

The San Francisco exposition closed with a total paid admission for the two years of approximately 17,000,000 people.

The New York fair reopened its gates in May 1940, again presenting an entirely different picture from the exposition in San Francisco, being much larger, covering 1,216ac., including parking areas and transportation facilities. The site was at Flushing Meadow park in the New York borough of Queens, Long Island. The site was a reclaimed swamp, which was at the close of 1940 being prepared for a public park. The New York world's fair of 1939 and 1940 closed its gates with a total paid admission for the two seasons of 44,932,978 people.

Both expositions had on view significant exhibits of art, San Francisco with its outstanding collection of Italian masters and New York with its masterpieces of art, valued at \$30,000,000.

(L. Sk.)

Falk Foundation, The Maurice and Laura,

Pittsburgh, under its policy of devoting its resources to financing research studies of the factors affecting American industry, trade and finance, devoted 1940 chiefly to the completion of research studies for which grants had been made in earlier years and to the publication of their findings. The extension of the foundation's research program during 1940 consisted of a grant of \$42,500 to the Brookings institution, Washington, D.C., for a study of public relief in the United States. This study is designed to evaluate the present public relief policies and to appraise their administration, to the end of designing a program which will meet the relief problem adequately, but more economically. Studies completed and published during 1940 included: *Productivity, Wages and National Income*, at a cost of \$47,000; *Government and Economic Life* (vols. I and II), for which a grant of \$100,000 was made; and *Wartime Control of Prices*, under an appropriation of \$13,000. all of which were made by the Brookings insti-

¹Recently it has been found that sulphapyridine is more effective in treatment of gonorrhoeal ophthalmia than is sulphanilamide.

tution; and *The Output of Manufacturing Industries, 1899-1937*, the first segment of a study entitled *Production and Productivity of Manufacturing and Nonmanufacturing Industries in the United States*, for which \$90,000 was appropriated to the National Bureau of Economic Research, New York. The foundation's grants for 1940 included an appropriation of \$50,000 for the support of the Brookings institution's general research program and \$10,000 to the Carnegie Institute of Technology, Pittsburgh, for the annual support of the Maurice Falk Professorship of Social Relations, pending payment of the foundation's \$300,000 endowment-grant for the professorship. Farm Credit Administration: see FARMERS' CO-OPERATIVES; FARM MORTGAGES; FEDERAL LAND BANKS.

Farmers' Co-operatives. Growers' co-operative cotton gins led the list in new kinds of co-operative enterprises in 1940 in the United States. That fact is noted prominently in its review of farm co-operative activities in 1940 by the co-operative research and service division of the Farm Credit administration. The FCA, in addition to supervising government loans to farmers and co-operatives, maintains services for improving co-operative enterprises. Although less than 4% in number, co-operative cotton gins gin about 10% of U.S. cotton, says the FCA. Among other newer developments are 29 co-operative egg auctions in 11 states, all but two being owned by producers. The first co-operative egg auction was established in New Jersey in 1930. There were, in 1940, 68 co-operative fruit and vegetable auctions held regularly at rural points. Approximately half of them were owned by growers. Co-operative livestock auctions numbered about 1,300 but only a small proportion were owned by farmers. Active farm co-operatives engaged in marketing and in dealing in farmer supplies numbered in 1940 about 10,700, with 3,300,000 members, reported the FCA review. In addition there were 1,900 mutual fire insurance companies, 2,000 mutual irrigation companies and 600 farm associations that supplied electricity on a co-operative basis. The total number of farm co-operatives in the United States was in 1940 about 15,500. Government loans to farm co-operatives, in the fiscal year ending June 30, 1940, totalled \$81,273,693 and were divided among the following three agencies: federal intermediate credit banks, \$897,190; banks for co-operatives, \$62,176,819; Agricultural Marketing act revolving fund, \$18,199,684. (S. O. R.)

Farm Income. Total cash income of United States farmers in 1940 was about \$9,050,000,000 to \$9,075,000,000 as estimated in Dec. 1940, by the bureau of agricultural economics of the department of agriculture. This is approximately \$700,000,000 over United States farmers' income of 1939 and is the second highest since 1930. The high of the decade was \$9,100,000,000 in 1937. Cash income is made up of money received from farm products sold and from payments to farmers from the federal government. It does not include products consumed on the farm. Government payments run approximately between \$500,000,000 and \$750,000,000 annually. Sale of livestock rather than crops was responsible for the larger part of the gain in farm income in 1940. Industrial improvement growing out of the national defence program and other activities caused by the war in Europe was reflected during 1940 by a gradually increasing demand for farm products in the United States, despite a steady downward trend in exports of food and other agricultural products. The industrial improvement, which by October had reached a new all-time high (127% of the 1935-39 averages)

Income from U.S. Farm Products and from Government Payments to Farmers, First 11 months of 1940 and 1939

	1940	1939
Total income from farm marketings . . .	\$7,562,000,000	\$7,001,000,000
From all crops . . .	3,168,000,000	2,908,000,000
From grains . . .	913,000,000	795,000,000
From cotton and cottonseed . . .	587,000,000	532,000,000
Fruits . . .	400,000,000	390,000,000
Vegetables . . .	591,000,000	549,000,000
Tobacco . . .	206,000,000	222,000,000
All livestock . . .	4,394,000,000	4,093,000,000
Meat animals . . .	2,204,000,000	2,071,000,000
Dairy products . . .	1,370,000,000	1,243,000,000
Poultry and eggs . . .	667,000,000	652,000,000
Government payments . . .	606,000,000	716,000,000
Total, including government payments . . .	8,258,000,000	7,717,000,000

was also reflected in higher costs for farm labour as men left farm employment for that of industrial centres. The U.S. cash farm labour bill increased during 1940 for the first time since 1937. Cash income received by United States farmers for the first 11 months of 1940 and 1939 was estimated, respectively, at \$8,258,000,000 and \$7,717,000,000. Of this amount \$696,000,000 of government payments were received in 1940 and \$716,000,000 of government payments received in 1939. The table shows the estimated income received for farm products for the first 11 months of 1940 and 1939. (S. O. R.)

Farm Machinery. Manufacture and sale of farm machinery in the United States in 1940 exceeded 1939 by substantial margins that may top the record year of 1937 when \$507,000,000 of farm machinery was sold at home and abroad. In 1939 total sales were \$479,000,000, of which \$410,000,000 was domestic and \$61,000,000 export. Exports, largely to Canada, the first six months in 1940 were 24% above the same period in 1939, or \$43,400,000 in 1940 and \$34,900,000 in 1939. Total exports in 1940 probably reached upward of \$87,000,000, as estimated by Harry G. Davis, director of research of the Farm Equipment institute, in an address before the 47th annual convention of the institute Oct. 3, 1940. Wholesale sales by the industry in the five-year period of 1935-39, Mr. Davis said, averaged \$461,000,000, of which \$408,000,000 were sold for use in the United States and \$53,000,000 abroad. An entirely new type of machine and process for harvesting and utilizing hay represented the most significant technological advance in the farm machinery industry in 1940. For 40 years there has not been a fundamental change in haying equipment, while other farm machinery has increased in both efficiency and economy of operation. The same amount of labour and the same wasteful methods are represented today in haying as at the beginning of the century. Several implement manufacturers are developing a new machine designed to mow the standing hay, chop it up and dump it into trailing wagons which carry it to silos where it is mixed with molasses, ground corn,

acid or other fermenting agent and stored as green silage. If the hay is cut and cured in the field the machine picks it up, chops it and dumps it into trailing wagons which transport it to the barn. Chopped hay requires one-third to one-half as much storage space as unchopped hay. The number of tractors on U.S. farms in 1940 was estimated by *Implement and Tractor*, Kansas City, Mo., as 1,762,795, as of July 1, 1940. The number in 1939 was estimated by *Farm Implement News*, Chicago, as 1,625,820, as of April 1. The table shows tractors on U.S. farms July 1, 1940, by states, as estimated by *Implement and Tractor*.

(S. O. R.)

Farm Mortgages. Operations of one of the principal farm loan agencies, the federal land bank commissioner, were extended by act of Congress in 1940 to June 1, 1942. The land bank commissioner makes loans to farmers on first and second mortgages to purchase farms, to refinance outstanding loans and for other agricultural purposes. Generally such loans are to farmers ineligible to borrow under the more rigid requirements of the 12 federal land banks. Land bank commissioner loans to farmers outstanding at the close of the fiscal year ending June 30, 1940, numbered 433,706 and totalled \$668,850,213, the Farm Credit administration reported. Farm mortgage loans of the federal land banks outstanding on the same date numbered 616,308 and totalled \$1,880,408,005. These two government agencies held about 40% of the total of farm mortgages in 1940. Farm mortgages held by the now remaining joint stock land banks, June 30, 1940, numbered 16,743, for a total amount of \$57,334,169. On that date 31 joint stock land banks were in operation, four were in voluntary liquidation and six were in receivership. Formerly there were 88 joint stock land banks, which were private corporations organized under the Farm Loan act of 1916. Under the Emergency Farm Mortgage act of 1933 the joint stock land banks were forbidden to make further loans, except renewals, and have since been in a process of withdrawing from business. They had made a combined total of 130,728 farm mortgage loans for \$903,194,063. The Farm Credit administration (FCA), which directs the governmental farm lending agencies, was a separate organization until 1939 when it became a part of the department of agriculture. Proposed new legislation in congress in 1940, affecting farm loans, involved two conflicting viewpoints. One contended that the Farm Credit administration be maintained apart from the department of agriculture. The other, as expressed in the Jones bill, advocated that the department of agriculture extend farm credit on still more liberal terms than had been done heretofore. The Jones bill was successfully opposed by the American Farm bureau, the Grange and other farm organizations and by the American Bankers association. Farm mortgages outstanding in 1940 in the hands of governmental and private agencies totalled about \$7,000,000,000, a comparatively small decrease from the \$7,071,000,000 total of 1939. The peak of farm mortgage debt was \$10,751,000,000 in 1923. For details of other farm credit operations see FARMERS' CO-OPERATIVES and FARM TENANCY.

(S. O. R.)

Farm Security Administration: see FARM TENANCY; HOUSING; MEDICINE: *Socialized Medicine*.

Farm Tenancy. Four of every 10 farm families in the U.S. are tenants and the number is increasing by about 40,000 a year, reports the *Agricultural Situation*, monthly publication of the U.S. department of agriculture. In efforts to combat the growing tenancy the Federal Farm Security administration ended, on June 30, 1940, the third year (1937-40) of the tenant purchase program it is conducting and in which it made

loans to 13,000 tenant farmers in 1,300 counties to buy farms. Of these loans \$38,000,000 was lent to 7,000 farmers, approximately, in the fiscal year ending in 1940; in 1938-39, \$25,000,000 and in 1937-38, the first year of the program, \$10,000,000. Average of loans varied slightly in different years but was \$5,400 for the three years (1937-40). There were 133,000 applications for loans in 1940. Those eligible for loans are farm tenants, share croppers and farm labourers. Under supervision of the Farm Security administration local farmers' committees select the persons to whom loans are made and approve the farm to be purchased. Family-size farms are selected and the loan covers the cost of the land and putting farm buildings in repair. Loans are allocated among the states according to farm population and proportionate tenancy. Tenants obtaining loans co-operate with the FSA supervisors in adopting a "farm and home plan" which provides for home production of food and livestock feed and two products for sale. From July 1, 1935 to June 30, 1940 the Farm Security administration made rehabilitation loans of \$376,476,000 to 559,000 farm families. To some of these and to 546,000 additional farm families, the FSA made grants of \$112,531,000, chiefly in areas devastated by floods or drought. (See also FARM MORTGAGES.)

(S. O. R.)

Fascism is the name for a political philosophy which puts the nation-state or the racial group, its power and domination, into the centre of life and history. It disregards completely individuality and individual rights as well as mankind and humanitarian claims, in the exclusive interest of the national collectivity and its increase of might. As a political technique it aims at the exclusive existence of a single party which identifies itself with the state and makes it subservient to its aims. Under its guidance the whole nation is strictly regimented politically, economically and culturally; its organization is modelled after the army, with stern insistence upon hierarchy, authority and obedience. Fascism denies the equality of individuals or races, disbelieves in international co-operation and extols the sacred egoism of the nation. Its insistence upon the right of the stronger, its disregard for universally binding international law and for reciprocity and equal rights of peoples were responsible for the international anarchy characteristic of the '30s in the 20th century.

From 1936 on, the leading fascist powers, Germany, Italy and

"SHE SAYS, 'I DO,'" declares Pétain in this English attack on France's "voluntary" transformation into a semifascist nation July 10, 1940. The cartoon is by Whitley in the *London Daily Herald*

A READY-MADE "FOUNDATION for a New Bastille" was France's constitution of 1940 as seen by Bishop in the *St. Louis Star-Times*

Japan, co-operated closely politically, economically and diplomatically. Their anti-Comintern pact of 1937 served as an instrument for their joint battle against communism and against democracy. That this pact was above all an opportunist attempt to secure world control to the detriment of the western democracies, especially Great Britain and the United States, was made clear when Germany concluded in Aug. 1939 a pact of friendship and nonaggression with the soviet union. The anti-Comintern pact was quietly allowed to recede into the background, but it was replaced by a formal alliance among the same three leading fascist powers when on Sept. 27, 1940, in Berlin, Germany, Italy and Japan united for the purpose of their common struggle to establish a new world order. While formerly fascism had tried to sell itself to certain conservative and capitalistic circles in the democracies as a bulwark for conservatism against social revolution and communism, it now proclaimed itself the great social and revolutionary force which would end the reactionary and conservative "pluto-democratic order" and establish a new order, primarily in Europe and Africa under German and Italian leadership, and in eastern Asia under Japanese leadership, but an order which was destined to become the common new order of mankind.

The effort to broaden the base of the new order by the adhesion of other nations, although announced with great insistence in the fall of 1940, failed. Only three minor vassal states or protectorates of Germany, Slovakia, Hungary and Rumania, signed the pact. It became clear that the new order was not to be based upon the voluntary collaboration of free and equal peoples, but was to be strictly of a hierarchical nature with the German and the Japanese races dominating and guiding the weaker or so-called inferior races, which were to be disarmed and made economically subservient to the leading races. By her conquests, Germany succeeded in introducing fascist conceptions into the conquered countries, Norway, the Netherlands, Belgium and France, but with the exception of France where the defeat offered to some native groups (long hostile to the French Revolution and its principles of liberty, equality and fraternity) the opportunity of seizing power, the attempted fascistization met with the stubborn resistance of the majority of the conquered peoples. The continued resistance of the British democracy and the defeat of the fascist

Italian forces by Greece, as well as the successful organization of Chinese democracy in its struggle against Japan, had by the end of 1940 created a situation in which the so-called new order was existent only in so far as German or Japanese armies imposed it by their presence. Rumania, which had been a semifascist country for several years, joined the ranks of fascism openly when in the late fall of 1940 the Iron Guard or the Legion of the Archangel Michael seized power and established a so-called legionary state which began its career by the assassination of a number of the leading conservative statesmen, generals, high officials and intellectuals of Rumania. In Norway at the end of September Major Vidkun Quisling was imposed by the German forces of occupation as the ruler of Norway, and with the help of his minister of propaganda, Gudbrand Lunde, he quickly copied all the methods of national socialism. The semifascist government in France under Marshal Pétain declared the belief in the equality of man and in government by the people as absurd and introduced the same anti-Semitic legislation as that prevailing in other fascist nations.

In Japan Prince Fumimaro Konoye formed in July a government, the task of which was the building of a new national structure according to the fascist model, in which the nation's total power would be regimented for the attainment of the domination of the far east. Under the influence of this fascist trend the Christian churches in Japan were expected to conform to Japanese nationalist and totalitarian ideals. A united party, the Imperial Rule Assistance association, was founded to carry through the building of the new structure of Japanese life. It held its first three-day session in Tokyo in Dec. 1940, when the chairman of the meeting stressed the unity of Japan with Germany and Italy in the decisive battle between the new fascist order and the democratic way of life.

The recognition of the true intentions of fascism, of its uncompromising hostility to democracy, of its ruthless scheming for the establishment of the world domination of the leading fascist powers, of its treatment of populations who had submitted or had not resisted sufficiently, brought about a more determined will to resistance on the part of the democracies. The role played by direct and indirect fascist propaganda, especially by native "fifth columns," in the disintegration of democratic countries and in the undermining of their will and ability to maintain their forms of life, aroused democratic vigilance, and strong measures were taken in the democratic countries to protect themselves against the fascist menace, both from within and from without. That was especially noticeable in the two Americas where the various fascist groups showed a united attitude in their anti-Semitic propaganda and in their insistence upon isolation and upon nonintervention in Europe and the far east to help the victims of fascist aggression. Fashion and Dress. In 1940, world affairs had a tremendous influence on fashion, for in that year Paris, for centuries the great creator of fashion, fell to German conquerors and the fashion centre of the world switched to New York. Late in January, the American buyers made their last trip to Paris for the spring openings. They found there a city of black-outs and spring fashions marked by simplicity and practical details. The blue worn by the French air force was the chic colour. Many of the evening dresses had sporty shirtwaist tops over long, slim skirts. Some of the summer day silks featured

Left: **MILITARY INSIGNIAS** ornamented sleeves, belts, caps and bags. This gold eagle is embroidered on a corduroy suit designed by Hattie Carnegie

Right: IN 1940 girls wore pompadours and pompadour hats made to accommodate their hairdress. The hat was designed by Sally Victor, who took the idea from the bonnet of one of Brigham Young's wives

Above: **AMERICAN DESIGNERS** delved into American history for inspiration in 1940 and there was much talk of Indian fashions. Sally Victor did this hat in feathers

Left: **KNIT AND CROCHETED CAPS** came in during 1940, probably because of the fact that many women were knitting for soldiers. This cap is by the American designer Sally Victor

Below: **VINYLTE SLIPPERS**. This new transparent plastic was a fashion sensation of 1940

Below: **TURBANS** were worn both by day and evening in 1940 and were effective with the new straight slim dresses. The Persian exhibition in New York city inspired many of the colour schemes. This dress is from Henri Bendel

Below: **THE SLIM LINE** replaced the bouffant in evening dresses in 1940. The sarong dress at the left is by James J. Rothenberg and the jacketed evening dress is by Pattullo Modes. Both designs are American

Below: **JET-TRIMMED EVENING DRESSES**, suits and evening jackets were popular in 1940. This is one of the last dresses made before the fall of Paris. It is by Balenciaga, in mustard jersey with a black top

aprons, an idea that caught on in America and later developed into the pinafore dress which American girls took back to college in the fall. By summer, Paris was occupied and it became evident that America would have to create its own autumn fashions, with no help from the French. After the armistice was signed, some of the French designers returned to Paris and started work once more, but their creations never reached the outside world. London continued to export sweaters, woollens and leather goods across a perilous Atlantic—but a London battered by air raids could not supply fashion leadership. The first all-American openings in August were greeted by a blaze of publicity. Skirts crept up a bit, because American women like to show their famous American legs. In evening dresses the long, slim silhouette replaced the bouffant, and all the smartest evening dresses had covered shoulders or jackets, suitable for wartime entertainments. Many of these jackets were heavily trimmed with embroidery in silk, beads or paillettes, and the colours were largely inspired by the Persian exhibition that had been shown in New York in the spring. The combination of pink red, Persian blue and gold was repeated ad infinitum. Because practically everyone was knitting for the soldiers, knitted and crocheted hats were greatly worn. Colourful enamel shields or cockades bearing the allied colours were sold for the benefit of war charities and replaced jewels on suit lapels. The American eagle screeched from sleeves, hatbands and from the clasps of bags and belts. Some American designers made an effort to look back into American history for inspiration. There were big Indian feather hats, and shoes inspired by Indian moccasins. Mormon bonnets were patterned after the hats worn by Brigham Young's many wives. As the autumn progressed, leopard fur became the rage. The South Seas sarong was modified for evening wear.

GERMANY joined the race to become fashion centre of the world in 1940 after the fall of Paris. The picture shows a German-designed fall outfit with black drape dress and a matching coat with silver fox cuffs

A rough chinchilla wool was used for the jackets of suits and for long, fitted evening coats. Woollen dinner dresses were extremely popular, especially for country week ends. In 1940, too, the chemical laboratories made their contribution to fashion. Nylon stockings appeared in the shops and manufacturers could hardly keep up with the demand. Vinylite, a new plastic, was used for slippers, transparent as Cinderella's famous glass ones. Young girls began combing up their pompadours. What had been a small curl or roll on top of the head now became a real pompadour. The front hair was caught up and then pushed forward so the back hair fell straight to the shoulders with big, loose curls at the ends. Skullcaps and pompadour bonnets were made for the hundreds to accommodate the new hair-do. There was some talk of false hair, false chignons and false braids. All in all, it was a period of transition, as designers accustomed to copy were forced to stand on their own. It was also a year of colour. Travellers were going to South America, and South American dancers were dancing in the night clubs in native costumes. Gaucho red, Inca pink, orange, green, purple crept into turbans, scarfs and accessories, and inspired all the designers to wilder and wilder flights of fancy. (See also FURS.) (C. SN.)

Faversham, William

(1868-1940), Anglo-American actor whose original name was Jones, was born in London, Feb. 12. He was educated at Hillmartin college. He first appeared on the stage in the Vaudeville theatre, London, in 1885. He played in stock company for a while and went to the United States in 1887, appearing with Helen Hastings in *Pen and Ink*, an unsuccessful play which closed after two weeks at the Union Square theatre in New York city. By 1901 he had made a place for himself and was starred. He at one time or another was leading man for Minnie Maddern Fiske, Maude Adams and Maxine Elliott. His last appearance on the stage was in *Tobacco Road*. He spent the last years of his life in a home for actors at Bay Shore, N.Y. He died April 7.

Federal Bureau of Investigation

of the United States department of justice is charged with the duty of investigating violations of the laws of the United States, collecting evidence in cases in which the United States is or may be a party in interest and performing other duties imposed upon it by law. By presidential directive, the FBI has jurisdiction over espionage, sabotage, neutrality violations and related national defence matters.

During the fiscal year 1940, 5,605 convictions were secured in cases investigated by special agents of the FBI. A total of 4,157 stolen automobiles transported in interstate commerce was recovered. Since the passage of the Federal Kidnapping law in 1932, a total of 185 cases has been reported to the FBI, and on Aug. 1, 1940, 183 had been completely solved. Bank robbery reached its peak in 1932, and following the passage of the Federal Bank Robbery act in 1934, bank robberies have declined nearly 80%. In the year 1940, convictions were secured in more than 96% of the cases investigated by the FBI when prosecuted in court.

A total of 16,885 national defence matters was received during the fiscal year 1940 which required investigative activity. At the request of the war and navy departments a program of surveying the protective facilities of manufacturing establishments having large contracts to provide the government with defence material was inaugurated. During 1940, 270 plants were surveyed and recommendations designed to maintain a maximum of protection were made to the plant officials.

In 1924 the identification division of the FBI was founded with a nucleus of 810,000 finger-print records and on Aug. 1

1940, more than 13,000,000 finger-print records were on file. Despite this growth, it is possible to identify an incoming set of impressions in three minutes. The civil identification section maintained for the insurance of personal identity of citizens numbers nearly 2,000,000 finger-print records. Of the 7,097 examinations involving more than 39,500 different specimens made by the technical laboratory in 1940, 2,065 were for local authorities. The cost of operating the FBI in the fiscal year 1940 was \$7,300,000 while savings to the government, property recoveries and fines totalled \$58,390,180.64 or a return of \$8 for every \$1 spent. Federal Council of the Churches of

Christ in America. In 1940 the Protestant Episcopal Church, after having maintained a semi-official relation with the council for many years, entered into full membership. The constituent bodies of the council included in 1940 most of the major Protestant bodies and one church (Syrian Antiochian Orthodox) of the Eastern Catholic group. The total constituency was slightly in excess of 22,000,000 communicants.

The National Christian mission was launched with an itinerary covering 22 cities in 22 weeks, for the purpose of strengthening the spiritual foundations of American life. On Feb. 27-29 an interdenominational conference on the relation of the churches to the international crisis was held in Philadelphia. In order to provide an adequate religious ministry to the youth called into training camps under the Selective Service act, President Paul D. Moody of Middlebury college was secured as director of the general committee on army and navy chaplains. A special committee on the rights of conscientious objectors was created. A program for relief of wartime suffering, including assistance to European refugees, the Chinese and prisoners of war, was carried on jointly with the Foreign Missions conference.

Religious programs over national radio networks were presented at least once every day throughout the year. Interdenominational conferences on preparation for marriage and homemaking, on the relation of mental hygiene and religion, on public worship and on Christian social work were held in many local communities.

A plan for improving the service of Negro rural churches in several southern states was undertaken. A program of public relations, designed to secure a wider interpretation of Christianity and the church to those sections of the population not reached directly by the normal processes of local churches, was begun. *Information Service* continued to be published weekly, presenting analyses of contemporary social problems.

At the biennial meeting of the council held at Atlantic City, N. J., Dec. 10-13, Dean Luther A. Weigle was elected president; Rev. Dr. Albert Edward Day, vice-president. Rev. Dr. Samuel McCrea Cavert is general secretary. (S. McC. C.)

Federal Crop Insurance Corporation: see CROP INSURANCE.

Federal Home Loan Bank System

was created by act of U. S. congress approved July 22, 1932, to provide reserve credit facilities for thrift and home-financing institutions of the United States. It is supervised by the federal home loan bank board composed

of five members appointed by the president. The structure consists of 12 regional banks and their member institutions. The regional banks are located in Boston, New York, Pittsburgh, Winston-Salem, Cincinnati, Indianapolis, Chicago, Des Moines, Little Rock, Topeka, Portland and Los Angeles.

Institutions approved for membership must invest in the capital stock of their respective regional banks. The secretary of the treasury was also authorized to buy stock, and in 1940 the government owned approximately 74% of the aggregate stock of the regional banks. The banks obtain their funds, beyond their capital stock, through the sale of debentures and by accepting deposits from members. The funds of each bank are used mainly to make advances to members for the purpose of providing additional accommodations to local home owners and investors. Under certain conditions, advances for a short term may be obtained without the deposit of collateral. Long-term advances, which may run up to periods of ten years, must be secured by approved home mortgages or other acceptable collateral.

The bank system has experienced steady and rapid growth. On Jan. 1, 1933, it had but 101 members with estimated assets of \$217,000,000. By Dec. 31, 1940, membership had increased to 3,864 of which 2,387 were state-chartered home-financing institutions, 1,437 federal savings and loan associations, 29 insurance companies and 11 savings banks; their combined assets were approximately \$5,000,000,000. On the same date the paid-in stock of the bank system amounted to \$169,281,650 and the consolidated assets of the banks came to \$299,723,142. During 1940, institutions which were members of the bank system made about 40% of the new mortgage loans on urban homes made by all private institutional lenders throughout the United States.

To the extent that current needs for additional housing for national defence can be privately financed, the federal home loan banks and their member institutions by resources and experience are peculiarly equipped to make and service mortgage loans and thus under local supervision provide such housing for both temporary and future requirements as can be financed safely by private investments. In addition to their duties arising from the administration of the bank system and the supervision of federal savings and loan associations, the federal home loan bank board serves as the board of directors of the Home Owners' Loan corporation and also constitutes the board of trustees of the Federal Savings and Loan Insurance corporation. (J. H. FA.)

Federal Income Tax: see INCOME TAX; TAXATION.

Federal Land Banks. The 12 federal land banks operating in the United States since 1917, under the Federal Farm Loan act of 1916 and subsequent legislation, make long-term first-mortgage loans on farms through 3,652 local co-operative lending institutions known as national farm loan associations. Since 1933 the land banks and the local associations have operated under the supervision of the Farm Credit administration which also supervises other federally-sponsored co-operative institutions providing short-term production credit and loans to farmers' co-operative business organizations.

Federal land bank loans outstanding on Dec. 31, 1940, aggregating \$1,841,572,542, plus \$646,659,778 of land bank commissioner loans made by the land banks as agents, represented 36% of the total farm mortgage debt of the country. Land bank commissioner loans, made on second as well as first mortgage security, were first authorized in 1933 for emergency financing, and cannot exceed \$7,500 to any one farmer.

The total capital of the 12 federal land banks was \$177,940,300

on Dec. 31, 1940, of which 62.1% was owned by national farm loan associations and individual farmers borrowing directly from the banks. The remaining amount was provided, and is owned by, the United States government. Funds for making loans are obtained primarily from the sale of farm loan bonds to the investing public. Farm loan bonds aggregating \$1,755,151,540 were outstanding on Dec. 31, 1940.

On Jan. 1, 1941, federal land bank loans were being made to farmers through national farm loan associations, of which there were 3,635 on Dec. 31, 1940, at an interest rate of 4%, which is 1% above the rate at which the last preceding bond issue was sold. The rate of interest is temporarily reduced to all borrowers by act of congress.

Federal Reserve System.

International developments in 1940 had important repercussions on the banking system of the United States. The invasion of the Netherlands, Belgium, France and other countries necessitated the institution of direct control over bank balances in the United States belonging to certain foreign governments and their nationals, in order to prevent the liquidation of such funds under duress. As a result, over \$1,000,000,000 of bank deposits, along with other foreign-owned assets in the United States, may be transferred only by authorization of the secretary of the treasury. Enormous amounts of gold continued as in years past to be shipped to the United States, the shipments in 1940 being largely occasioned by purchases, actual and anticipated, of war supplies. Most of this gold was sold to the United States government and increased bank reserves and bank deposits. Excess reserves of member banks of the federal reserve system increased still further during the year, and long-term interest rates fell to their lowest recorded levels. Foreign developments stimulated an increase in defence expenditures in the U.S., and this in turn led to a substantial increase in the volume of loans made by banks.

Partly on account of the rapid expansion of business activity which began in May, 1940, and the existence of nearly \$7,000,000,000 of excess reserves, the federal reserve authorities submitted to congress a program designed to put the system in a position "to take measures, when necessary, to forestall the development of inflationary tendencies." The following is a summary of the program suggested for congressional consideration:

1. The system should be provided with such additional powers as would enable it to absorb a large part of existing excess reserves, as well as such additions as may occur.

2. The president's power to change the gold value of the dollar, as well as the treasury's authority to issue \$3,000,000,000 of greenbacks and to issue silver certificates against foreign silver purchases, should be discontinued; this would remove three of the main sources of potential increase in excess reserves.

3. Means should be found to prevent a further growth in excess reserves and in bank deposits arising from future gold imports.

4. Government expenditures in excess of tax receipts should be financed by sales of government securities to individual investors rather than to the banks.

5. As the national income rises, an increasing part of defence expenditures should be met by tax revenues rather than by borrowing, with the ultimate objective of balancing the budget at the time when the country approaches a condition of full utilization of its economic capacity.

The monetary gold stock at the end of 1940 amounted to \$22,000,000,000, an increase of more than \$4,300,000,000 over that of Dec. 31, 1939. Gold held under earmark by the Federal Reserve Bank of New York for foreign account also increased by \$642,000,000 and amounted to \$1,800,000,000 at the year end. All but \$150,000,000 of this increase in the monetary gold stock

and in earmarked gold came from abroad. A large part of the gold inflow was attributable to a surplus of merchandise exports from this country of nearly \$1,500,000,000 in 1940. Most of the remainder appears to have represented capital inflow, much of which, however, could not be fully identified. Beginning in May the predominant factor in the reported—and possibly in the unreported—movement of capital was the official transfer of funds to the United States.

The government's acquisitions of \$4,300,000,000 of gold, and also of \$100,000,000 of silver, tended to produce a corresponding increase in the reserves and deposit liabilities of commercial banks. However, the increase in bank reserves was less than the amount of such acquisitions on account of the increase of \$100,000,000 in money in circulation and of the net sales of \$300,000,000 of securities by the federal reserve banks. All it should be noted that the growth of nonmember bank reserves tended to reduce the reserves of member banks. As a result of these and other offsetting factors the reserves of member banks rose only \$2,400,000,000, as compared to the increase of over \$2,900,000,000 in 1939. Since only a part of the increased reserves of member banks was required by law to be held against their additional deposit liabilities, the remainder served to create their "excess reserves," which rose to over \$7,000,000,000 during the latter part of October. This increase in excess reserves contributed to a further reduction in medium- and long-term interest rates to their lowest recorded levels. In Dec. 1940 the average yield on treasury bonds of 12 or more years' maturity was 1.89%, as compared to 2.35% in Dec. 1939, and on treasury notes of 3 to 5 years' maturity the yield was .35%, as compared to .51%. The yield on the highest grade corporate bonds averaged 2.71%, as compared to 2.94%.

After a decline in industrial activity during the first few months of 1940, there was a sharp upturn beginning about May. The board of governors' index of industrial production rose from 111 in April to approximately 136 in December, with a further increase in prospect. This increase in industrial activity from May to December was accompanied by an increase of \$620,000,000 in the commercial, industrial and agricultural loans of the weekly reporting member banks of the federal reserve system.

Commercial banks greatly increased their holdings of direct and guaranteed obligations of the United States during 1940. Weekly reporting member banks alone added about \$1,300,000,000 to their portfolios. The federal reserve banks, on the other hand, reduced their holdings by about \$300,000,000 to \$2,200,000,000, which at the year end were less than at any time since the autumn of 1933.

The open market operations of the federal reserve system have been so timed as to moderate the movements of bond prices and have not been made with reference to their effect upon the volume of bank reserves. Early in May, when foreign developments tended to depress the government bond market, the open market committee purchased about \$10,000,000 of government securities. This action was analogous to that taken in August and September in 1939, when about \$470,000,000 of government securities were purchased during the decline in bond prices shortly before and after the outbreak of war in Europe. During the latter part of 1940, the federal open market committee sold government securities as the market strengthened.

As a result chiefly of the government's large acquisitions of gold and silver and of the increased holdings of government securities by banks, bank deposits reached an all time peak. The amount of currency held by the public also increased, partly as a result of increased business activity. Consequently, at the end of 1940, bank deposits, exclusive of inter-bank balances, all commercial and savings banks and currency outside the banks

mounted to about \$70,000,000,000, which is approximately 25% greater than the highest pre-depression level. A large part of this supply of money was idle, as was evidenced by the low rate of turnover. (See also BANKING.) (M. S. E.)

Federal Surplus Marketing Administration: see BUTTER; MEAT; POTATOES.

Federated Malay States, area 27,540 sq.mi., population (1939) 2,125,274, are one of the three main subdivisions of British Malaya, the others being the Straits Settlements and the Unfederated Malay states (*qq.v.*). There are four Federated Malay states, Perak, Selangor, Negri Sembilan and Pahang, of which the first three are on the west coast of the long Malay peninsula, while Pahang is on the east coast. Each state is administered under the advice of a resident who is subject to the instructions of the high commissioner, an office combined with that of governor of the Straits Settlements. High Commissioner in 1940: Sir Thomas Shenton Whitelegge Thomas. The seat of the federal government is at Kuala Lumpur (Selangor), the largest town in the states, with a population of 27,124. The Federated Malay states have 1,068mi. of railway and 3,067mi. of roads. They constitute the immediate hinterland of the two great trading ports of Singapore and Penang and are rich in minerals and raw materials, of which the most important are tin and rubber. Secondary objects of production are gold, coal, tungsten, coco-nuts, oil-palms, rice and pineapples. Chinese labour is largely employed in the tin mines and Indian in the rubber plantations. The indigenous population, the Malays, are engaged in agriculture, hunting and fishing, avoiding industrial work. The area under rubber amounts to 1,625,000ac. The revenue of the states in 1938 was £7,356,197 and the expenditure £11,851,474. The public debt was £7,616,667. Imports in 1938 were £14,385,04 and exports £20,986,985. Expenditure on education was £386,620. There were 569 Malay schools, with 56,969 pupils; 497 Chinese with 44,367 pupils; 12,863 boys and 5,440 girls went to English schools. In all, 2,661 vessels, with a total tonnage of 1,589,101, cleared the ports in 1938. The unit of currency is the Straits dollar, worth 47.51 cents U.S. in Dec. 1940. (W. H. CH.)

Federation of Labor, American: see AMERICAN FEDERATION OF LABOR.

Feldspar. Almost the entire commercial utilization of the feldspars is in the ceramic and glass industries. The United States is the world's largest producer and consumer, followed by Sweden, China and Norway, with a number of minor producers. World production is of the order of 400,000 to 500,000 metric tons, of which the United States contributes nearly two-thirds. The 1939 consumption of ground feldspar in the United States was 259,200 short tons, 4% of which was imported from Canada, about 53% in glass, 34% in pottery, 11% in enamel and sanitary ware, leaving 2% for miscellaneous uses, most of which are of a ceramic character. (G. A. RO.)

Fencing. Fencing continues to make encouraging progress in the United States under the jurisdiction of the Amateur Fencers League of America, an organization now in its 50th year of existence. During 1940 five new divisions were added to the organization, making a total of nearly 30 divisions, from New York to Oregon, Texas on the south, and including Hawaii. Fencing also occupies a prominent place on the sports curriculum of colleges and schools.

Competition in the national championships of the A.F.L.A. was much keener than ever before, leading to many exciting and tense

JOANNA DE TUSCAN, champion woman fencer of Detroit, Mich., in a 1940 bout

moments. A large contingent of Cuban fencers competed, adding considerable interest for both competitors and spectators. Dr. John R. Huffman, president of the league, who captured many individual and team titles during the past 20 years, accounted for the national three-weapon title, was third in the sabre championship, a member of the championship sabre team, and the three-weapon championship team. Dernel Avery led in the national foil championship; Fred Siebert displaced the capable Loyal Tingley in the épée event, and Norman C. Armitage took the sabre title.

The outstanding episode in the women's division of the league championships was the crowning of a new foil champion, Miss Helena Mrockowska, who has taken the place of Miss Helena Mayer, who held the title for a number of years. The women's foil team of the Salle Santelli was victorious. Miss Maria Cerra, of the Salle d'Armes Vince, former intercollegiate champion, won the Alice Wendt Voorhees open women's individual fencing medal against a field of 27. The league issued a new book, entitled *Fencing Rules*, with the co-operation of other fencing associations. (J. B. P.)

Fertilizers. During 1940 the war in Europe materially affected the production and consumption of fertilizer raw materials throughout the world.

Continental Europe in 1940 was unable to import its customary needs of phosphate rock from Africa and the United States and was unable to export freely its potash salts and nitrogen compounds to the western hemisphere and to other parts of the world. Britain was unable to obtain potash from the Continent and the scarcity of ships made difficult sufficient imports of phosphate rock, nitrate of soda and potash salts from her possessions and from the Americas.

Governmental orders in most of the belligerent countries either controlled the amount of plant food that might be used, or else specified the crops on which it might be used, or both. In most of these countries also strict price control of fertilizer materials was in effect in 1940. Censorship prevented the release of dependable statistical data concerning production and consumption within the warring nations.

At the beginning of the war in 1939, Germany was believed to have an annual nitrogen fixation capacity of 1,750,000 tons and was in 1940 believed to control additional capacities in overrun Norway, Belgium and Holland of 495,000 tons. Great Britain and Japan undoubtedly greatly increased their nitrogen production. The defence program of the United States also curtailed export of fertilizer materials from that country.

Contrary to its position in the 1914-18 period, the United

States was in 1940 completely self-sufficient within its own borders as to the quantity of nitrogen, phosphoric acid and potash used in agriculture. Deposits of phosphate rock surveyed were known to contain thousands of millions of tons and to be sufficient for thousands of years. In 1939 production of phosphate rock amounted to 3,987,970 tons. Rapidly expanding development of four large plants producing potash salts from substantial reserves might even permit export in quantity later. Production in 1939 reached 524,986 tons of salts containing 307,051 tons of actual potash (K_2O). In 1939 nitrogen came from by-product coke ovens in the form of sulphate of ammonia in the amount of 676,800 tons. In the same year, Chilean nitrate of soda was imported to the extent of 604,390 tons, and approximately 400,000 tons were manufactured synthetically from the air. Many kinds of nitrogen-bearing organic by-products such as tankage, dried blood and vegetable meals add to the nitrogen supply. Nine plants for the fixation of atmospheric nitrogen have an estimated capacity of 375,000 tons of nitrogen a year. Additional plants were under construction in 1940 in the defence program. (C. J. Br.)

Few, William Preston (1867-1940), U.S. educator, was born in Greenville, S.C., Dec. 29, and was graduated from Wofford college in 1889. He became professor of English in Trinity college at Durham, N.C. in 1896 and rose to the presidency in 1910. When this college became Duke university he continued as president. Dr. Few was a prominent Methodist layman. He died in Durham, Oct. 16.

Financial Review. The year began with the subsidence of a premature war boom caused by the outbreak of war in Poland in Sept. 1939. It ended on the rising tide of a genuine war boom caused by British orders for American implements of war and by the U.S. defence program.

On the premature boom there was heavy forward buying of raw materials in expectation of large war orders. But the French and British governments were unexpectedly slow in placing orders, inventories piled up in factories, and the Conference board's index of new orders received by manufacturers fell from a high record of 178 (1935-39=100) in Sept. 1939, to 108 in March 1940. In order to prevent further rapid accumulation of inventories, manufacturers curtailed output in the first quarter of 1940. The federal reserve index of industrial production declined

from 126 in Dec. 1939, to 111 in April 1940.

In April and May the German invasions of Denmark, Norway, the Low Countries and finally France made Britain redouble its efforts to defeat Hitler. It became increasingly probable that the United States would be compelled to lend more active assistance to the British empire. U.S. manufacturers again revised upward their estimates of forthcoming demands on their facilities, and forward buying was resumed, as reflected in a renewed rise in the Conference board's index of new orders. From 108 in March the index advanced to a new high record of 208 in November.

In the second quarter orders for machine tools, aeroplane iron and steel and explosives began to pour in from Britain. The shipbuilding industry was already booming, owing to the combined effects of the maritime commission's merchant marine program, the naval expansion program authorized by congress in 1939, and the anticipation of a shortage of cargo ships with the intensification of the German effort to blockade the British Isles. The industries concerned with these essentials of modern mechanized warfare, however, constituted but a small fraction of U.S. industry; and, despite record-breaking demand for them, industrial activity declined in the first quarter of the year and remained comparatively low in the second quarter.

United States steel producers, on the other hand, foresaw with considerable shrewdness the possibility of a bottleneck in crude steel, the capacity for the production of which had not increased in previous years as rapidly as facilities for producing finished steel products. They began producing and stocking steel ingots in quantity. The ensuing rapid advance in steel ingot production had its customary effect on general business conditions. In addition, the automobile industry, the influence of which on general business conditions is probably second only to that of the steel industry, continued to find a good market for its products. The business tide turned in April, and industrial production generally expanded.

But it took the impact of the U.S. defence program, or at least the active anticipation of it, to initiate the genuine boom that characterized the last quarter of 1940. The first of a series of laws authorizing huge increases in the military and naval establishments was passed in June. Thereafter, considerable time was required to organize the defence program, since it involved an unprecedented procurement of military and naval supplies and equipment. For much of the new equipment, moreover, existing capacity was insufficient. Consequently the first direct effects of the defence program were not felt until July, and even then they took the form of awarding of several large construction contracts for the expansion of aircraft factories, the construction of new tank and munitions factories and the building and enlargement of air fields.

Nevertheless in August and September the defence program began to get under way on a tremendous scale. By the end of August more than \$2,000,000,000 in defence contracts had been awarded. By the end of October the total was more than \$8,000,000,000; by the end of November more than \$9,500,000,000. From an economic and financial standpoint this sudden demand for military and naval equipment and supplies constituted a stimulus to industrial activity of unprecedented proportions. Steel ingot production rose to virtually full capacity and remained there throughout the fourth quarter. Capacity itself began to be enlarged by the relighting of abandoned furnaces and the construction of new ones.

The demand for skilled labour in the machine tool, aircraft and a few allied industries began to exceed the supply. Employment expanded and wages increased because of higher rates and longer hours. Public purchasing power rose, and the increased activity in the heavy industries was thus transmitted to industry

generally. Retail trade toward the end of 1940 became unusually active. Consumers' goods manufacturers expanded operations to keep pace with the increased demand. Railroad freight traffic, though still depressed in comparison with that of the '20s, nevertheless reached the highest volume in a decade. In all of these respects the sudden transition from a peacetime to a war-preparedness economy followed the customary sequence, though with pronounced emphasis on the role of engines of war requiring advanced skills and techniques, both in respect to design and fabrication.

But here one comes to a fork in the road, where the parallel with previous war booms ceases. Previous war booms had brought marked increases in commodity prices and the cost of living. Industrial raw material prices advanced moderately in 1939 and 1940; but prices in general were stable. The advance in raw material prices was indeed mild in view of the circumstance that in some instances, as for example zinc, shortages were reported. Price stability, obviously a desirable end in itself, seems to have been accomplished by political and moral suasion and common consent. Certain influential factions in the New Deal government at Washington were determined to keep prices from rising. They warned manufacturers not to advance prices. Manufacturers warned one another and their consumers. The gospel of price stability was preached with vim and vigour. Curiously enough, the self-appointed missionaries succeeded in preventing both themselves and their listeners from starting an upward spiral of prices. Previous war booms had brought booms to Wall street. But the 1940 boom brought none. Before the year opened common stock prices were already lower in relation to general business activity than at any other time in the history of the country, at least as far back as reliable records are available. As the year progressed this abnormal relationship became more abnormal. For a time the spread narrowed slightly, because in the first four months stock prices were comparatively steady while business activity declined. But the invasion of Holland in May caused a break in the stock market. The market never fully recovered from that decline despite the subsequent boom in business. Financial sentiment was depressed throughout the year. The number of shares sold on the New York Stock exchange was the smallest since 1921. The price of stock exchange seats fell to the lowest level in several decades.

Wall street was depressed by the certainty that any increase in profits resulting from the boom in business would be taxed away, or mostly so. Congress sought hurriedly to pass an excess profits tax. So-called treasury experts demanded and drafted an excess profits tax bill based on heavy taxation of all net income over and above certain percentages of invested capital. Wall street opposed the measure with might and main, though the extent of Wall street opposition never became a matter of public knowledge. Congress was impressed with the argument, which was perfectly sound, that a similar measure in 1918 had proved to be virtually unworkable, and that Britain and Canada had abandoned such taxes for taxes based on profits over and above peacetime averages. Congress rejected the treasury proposal to the extent of giving corporations a choice of either basis, but in writing its own tax law it raised the normal corporation tax to a new high level. The upshot of the matter was that investors forew little gain in corporation net income after heavier taxation, higher wages and increased costs all around had been accounted for.

Liquidation of British-owned U.S. securities was also a depressing factor, though probably a minor one. The British authorities announced at the end of the year 1940 that liquidation had been completed in a rather long list of leading stocks, but the market did not rally on the news.

The depression in Wall street seemed to have an important bearing on the defence program, though this may have been more apparent than real. Leading investment bankers raised the question whether the defence program was to be financed, in part at least, by private capital. The advantage of that procedure, it was pointed out, was that if part of the new capital required for additional plant, equipment and working capital could be raised through the new-issue market, to that extent the taxpayers would be relieved of what in any case would be a heavy burden. Obviously a depression in the stock market would restrict the amount of new capital which could be raised through the sale of securities to investors. The alternative was a continuation of federal borrowing through the sale of government securities to banks, insurance companies and to a small extent to private individuals. Investment bankers were afraid that the second alternative would lead to almost complete government control over private enterprise.

These fears were lightened to some extent when Loan Administrator Jesse Jones said that the federal government would not stand in the way of private financing whenever that could be arranged advantageously and expeditiously. Congress passed a law making defence contracts negotiable instruments for the purpose of obtaining bank loans. The Reconstruction Finance corporation, however, continued to stand ready to make loans at rates so low that private financing would be unattractive to many investors. The question remained to the end of the year in a somewhat muddled state. There was a moderate revival in new private financing toward the end of the year through the sale of new securities by investment bankers. There was a much greater revival, however, in the commercial loans of the member banks of the federal reserve system. Many of these loans were of rather long maturities. In the old days many of them would have been made via the new security market.

The banks, however, were in circumstances of unprecedented affluence with respect to lendable resources, mainly because of an extension on an even larger scale of the heavy gold import movement which had begun in the second half of 1938, so that at the end of the year the monetary gold stock amounted to approximately \$21,982,000,000, as compared with \$17,644,000,000 at the end of 1939. In part these imports represented payment for merchandise exported, especially war exports to Britain. In larger part, however, they represented a further flight of capital from other parts of a war-torn world.

The net consequence in the United States was a further increase in already swollen bank reserves. By the end of the year the excess reserves of the reporting member banks of the federal reserve system, notwithstanding the fact that reserve requirements were high, amounted to \$6,620,000,000.

The existence of these excess reserves raised still another question which seemed of paramount importance with respect to the defence program. Some economists and some federal officials, notably Marriner S. Eccles, chairman of the board of governors of the federal reserve system, expressed the fear that these reserves formed a basis for a potential credit inflation which might become an actual inflation as the demand for war supplies and skilled workers became intensified, thus tending to create an upward spiral of commodity prices and wage rates. Toward the end of the year, indeed, Mr. Eccles proposed a legislative program designed to put the federal reserve authorities back in control of the money market. This program provided among other things for giving the board of governors greatly enlarged powers over the reserve requirements of the member banks. The mere mention of this plan resulted in a decline in United States government bonds a few days before the end of the year.

Otherwise, however, the money market remained extremely easy

to the end. The only disturbance of any consequence in the course of 1940 was in May, when the German blitzkrieg was accompanied by a decline in high-grade bond prices. This decline proved temporary, however, and was followed by a renewed rise which carried high-grade bond prices to new high records for all time.

International trade, and with it the U.S. export trade, was changed radically by the spread of the war. One by one, as the German conquest engulfed European nations, U.S. exports to the conquered countries came to a standstill. Nevertheless these losses, severe though they were, were more than offset by increased exports to other countries, especially to Great Britain and to Latin America. As was the case in the closing months of 1939, the Latin-American demand for U.S. goods continued to be stimulated by the cutting off of the customary European sources of supply.

The chief U.S. sufferer from the consequences of the war was the farmer. Agricultural exports except cotton declined sharply. Cotton exports also declined sharply in the second half of 1940, after the termination of a subsidy and a barter arrangement with Britain. On the continent of Europe shortages of food began to be reported. According to U.S. farm experts, these shortages seemed bound to become worse with the prolongation of the war. But the British government refused to permit the shipment of American foodstuffs to European war sufferers. The war boom in the United States, on the other hand, created increased domestic demand for U.S. farm products. Domestic consumption of raw cotton was the largest on record. Cash farm income was higher than in 1939. Some farm experts predicted that in 1941 increased domestic demand would more than offset the loss of European markets for all farm products. But that remained a matter of conjecture.

National debts again increased at unheard-of rates. In the calendar year 1940 the total receipts of the United States treasury were \$5,834,000,000, as compared with \$4,918,000,000 in 1939. But total expenditures rose to \$9,800,000,000, as compared with \$8,938,000,000 in 1939. The federal deficit hence showed little change; the 1940 deficit was \$3,966,000,000, as compared with \$4,020,000,000. The total expenditures for the calendar year 1940 included few defence expenditures in comparison with the amounts obligated for future payments. It was predicted

that total government expenditures for the fiscal year 1942 would amount to the staggering sum of \$17,000,000,000. It was hoped that ordinary expenditures could be financed out of revenues, but there was no hope of financing defence expenditures except by further borrowing. The gross debt of the United States was expected presently to reach \$65,000,000,000, as compared with a new high record of \$45,024,631,488 at the end of 1940.

In Great Britain the fiscal situation was naturally even worse. Despite a rapidly increasing burden of taxation, huge borrowing was necessary to pay for war expenditures. Similarly all over the world, it seemed probable that at no time in history, certainly in modern industrial history, had national fiscal situations been in such conditions of utter chaos. In the light of that overwhelming fact details as to financial conditions become meaningless, even in the few countries for which details continue to be available. In Britain there has been considerable inflation. Wages and the cost of living have advanced sharply, with the usual discomfort of white-collar workers and others of comparatively stable incomes. Japan has had to contend with inflationary tendencies for several years, and the situation there is likely to get worse before it gets better. Statistics on economic conditions in most countries were discontinued with the spread of the war, but even if they were available they would merely add more horrible details to the virtually universal picture of havoc wrought by wartime conditions.

U.S. economists and business leaders were justifiably concerned over the probable seriousness of the next postwar depression. Various schemes were proposed in the course of 1940 for softening the blow.

With world conditions what they were in 1940, it seemed unlikely that any scheme could be devised that would alleviate to any considerable extent the deepening shadows of the inevitable consequences of the aftermath. Finland. An independent republic of northern Europe; capital, Helsinki; president, Risto Ryti.

Area and Population.—The area is 134,000 sq. mi. (land and

ELEVEN HOURS of Russian bombing on Feb. 2, 1940 reduced Sortavala on Lake Ladoga in Finland to a mass of ruins

REFUGEE CAMP AT TAMMISAARI, Finland, took refuge in the woods during visits of Russian bombers to their town in the early weeks of 1940

21,000 sq.mi.), after cession of 13,500 sq.mi. to the U.S.S.R. in 1940. The population is about 3,800,000, not materially reduced by the cession of territory, because most of the 450,000 people affected moved into other parts of Finland. Chief towns (pop. at Jan. 1, 1939): Helsinki (304,965); Turku (74,315); Tampere (76,730). Viipuri (74,247) was ceded to Russia. Language and nationality, 90% Finnish, about 10% Swedish. Religion, Lutheran Christian.

History.—The war between Finland and Russia began on Nov. 30, 1939, after the failure of several weeks of negotiation. As the curtain went up on the new year it looked as if the heroic and desperate Finns might have a chance to withstand the Russian onslaught at least if they could get aid in material and men from outside. Their fortified Mannerheim line on the Karelian isthmus was proving strong, the ski troops in the north were fighting a guerrilla-type war with cleverness and success and the nation as a whole was throwing its entire energies into the struggle for existence. The women of the Lotta Svärd organization did notable work. But gradually the U.S.S.R., which had underestimated both the determination and the skill of its opponents, brought to bear the weight of its vast resources of men and armaments. By slow but irresistible bombardments they rocked the pillboxes of the Mannerheim line, bombed 32 of Finland's 38 cities from the air, dropped about 100,000 bombs and destroyed 1,800 buildings. The number of Finland's killed and missing men mounted to almost 23,000 and another 43,500 wounded. With their line broken and the casualties rapidly increasing, the Finns could not hold out alone.

Volunteers from abroad could not reach Finland quickly enough or in great enough numbers. Several thousand came from Sweden, which also supplied munitions and medical supplies to an amount equalling about \$125,000,000. But troops from the west were not allowed to pass through Norway and Sweden in numbers greater than 100 per day because of the fear of the Scandinavian states that they would become themselves a main theatre of war. If large-scale aid came from Britain and France it was obvious that Germany would take measures to check it.

The result was that on March 12, 1940 the Finns signed a peace in Moscow. Territorially the treaty came to mean (with the agreement on details dated April 29): (1) cession of the Karelian

isthmus to the U.S.S.R.; this included the eastern islands in the Gulf of Finland, the city of Viipuri (Viborg) and the region around Lake Ladoga; (2) parts of the communes of Kuusamo and Salla on the middle eastern frontier; (3) the western part of the Rybachi peninsula on the Arctic sea (though Finland retained a tiny opening on the sea in the Petsamo region). In addition to these outright cessions, Finland leased to the U.S.S.R. for 30 years the Hango peninsula in the southwest, with surrounding islands. Russia had established herself once more in the Baltic. In a short time she was to consolidate her position further in Estonia, Latvia and Lithuania.

These losses, together with Finland's pledge to complete an east-west railway across the central part of the country, meant an almost helpless strategic situation and severe economic loss. Finland lost access to Lake Ladoga and the eastern gulf coast where about one-third of her fishing had been carried on. She lost rich forest resources, 10% of her arable land, her fourth largest industrial centre and 625mi. of railway. Perhaps a fair estimate of the monetary losses is \$600,000,000 and this is larger than the annual national income. The losses were the more staggering because almost the entire population (450,000) of the ceded areas had to be resettled in other parts of a country of meagre natural resources, and a dry season reduced the food crops of 1940.

Money for war and reconstruction poured in from the outside world, especially from Sweden and the United States. Hoover's "Finnish relief," for instance, raised about \$3,500,000. In 1939 and 1940 Finland had to postpone and ask for readjustment of its war debt payments to the United States. This was granted, as well as extensive government credits. But the problems of rebuilding were accentuated by the continuance of war around Finland, which made impossible the resumption of normal trade. When in the late summer of 1940 the Germans asked for transit privileges through Finland to Norway, the Finns were glad to grant the request, thinking that the presence of German troops might be a salutary warning to the Russians to encroach no farther westward.

The leaders of Finland's second war of independence began even in 1940 to leave the stage. Baron Mannerheim, the military genius of the campaign, stepped into the background. The zealous peasant president, Kjösti Kallio, was stricken with a heart at-

tack in August. In December he resigned, amid popular ovations to the reformer and statesman who personified the best of Finnish spirit. Ready to retire to his country home, he went to the railway station with a military guard of honour, turned and said to the people, "Good-bye, thanks for everything" and fell back dead in the arms of his friend, Field Marshal Mannerheim.

Elected to succeed him was the leading financial statesman of the country, the logical man to head up the economic reconstruction, former Premier Risto H. Ryti. The new president was once a member of the London bar and is an exceptionally able banker.

Finland tightened her belt and looked forward hopefully, sanely planning for the clearing of new lands and the building of new cities for the 500,000 rendered homeless, and for the restoration of buildings, such as the demolished technical university in Helsinki. Her national independence was intact and her spirit appeared to be equal to her emergency.

Finance and Banking.—At the last free quotations of 1939 the Finnish markka stood at 49 to the dollar, 197 to the pound. The Bank of Finland had outstanding 3,300,000,000 Finnish markka in currency, a gold reserve of 1,180,000,000 FM and foreign holdings of 1,800,000,000 FM. National budget (est. 1939): revenues, 5,534,700,000 FM; expenditures, 5,432,800,000 FM. Foreign debt (Sept. 1939), 1,040,000,000 FM; internal debt, 2,810,000,000 FM. (F. D. S.)

Trade and Communication.—External trade in 1938 (merchandise): imports 8,607,300,000 FM; (Jan.-Aug. 1939) 5,480,700,000 FM; exports 8,398,000,000 FM; (Jan.-Aug. 1939) 5,759,600,000 FM. Communications: roads, state (1938) 20,235 mi.; railways, state (1938) 3,670 mi.; shipping (June 30, 1939) 626,000 gross tons; motor vehicles licensed (July 31, 1939): cars 29,675; commercial vehicles 22,860; cycles 7,677; wireless receiving set licences (1938) 293,896; number of telephone subscribers (1938) 7,720.

Agriculture, Manufactures, Minerals.—Production 1938 (in metric tons): wood pulp 2,110,000; oats 826,000; (1939) 798,000; rye 369,000; (1939) 331,000; wheat 256,000; (1939) 227,000; barley 207,000; (1939) 192,000; potatoes 1,198,000; copper 12,600; butter, creamery 33,000; beet sugar 13,600; superphosphates of lime 62,000. Industry and labour: number of factories (1937) 4,246; employees 207,506. Industrial production index (1929=100) (average 1938) 155.6 (average June 1939) 155.6. Employment index (1929=100) (average 1938) 109.0; applicants for work (average 1938) 3,602; (average June 1939) 2,091.

Finley, John Huston (1863-1940), U.S. educator and editor, was born in Grand Ridge, Ill., Oct. 19. He was graduated from Knox college, Galesburg, Ill., in 1887 and spent the next two years at Johns Hopkins university. In 1892 he was called to the presidency of Knox college and remained there until 1899, when he accepted the editorship of *Harper's Weekly*. While holding this post he planned the news magazine *World's Work* with Walter Hines Page, and intended to become one of its editors, but he was called to the new chair of politics at Princeton university. He remained at Princeton until 1903, when he was made president of the College of the City of New York. He resigned in 1913 to become commissioner of education and president of the University of the State of New York, serving until 1921, when he was named an associate editor of *The New York Times*, becoming editor-in-chief in 1927 and editor emeritus in 1938. He was in France when the United States entered the World War of 1914-18, offered his services to General Pershing, and was made head of the Red Cross commission in

Palestine and the near east during the World War (1914-18). He was in demand as a lecturer and gave courses at the Sorbonne, Paris, the University of Edinburgh and several American universities. He was the author of many books. Thirty-two universities conferred honorary degrees upon him and he was decorated by 14 foreign governments. He died in New York city, March 7.

Fire Insurance: see INSURANCE, FIRE.

Fires and Fire Losses. The losses by fire and lightning—the statistics compiled by the National Board of Fire Underwriters cover these two forms under one head—amounted in 1940 to \$306,469,520. For each of the years since 1938 the total has been just above \$300,000,000. It was lowest in 1938, \$303,050,000 and highest in 1939, \$313,492,840, so 1940's record marks a slight falling off from the previous year, but an advance over 1938. It is customary to divide the losses into those where the damage is \$10,000 or more and those below that figure. In December there were 278 fires which caused more than \$10,000 damage, the total amount of damage done being \$10,758,300. This is about 40% of the total loss by fire during December.

Two losses suffered during the year should be especially mentioned, for while they were not fire losses, they were covered by the same groups of companies that write fire insurance. The first was the large loss due to the heavy windstorm of Nov. 1940. Close estimates were to the effect that the number of claims would reach at least 125,000 and that the average claim would be about \$20.

The other important loss was the disaster of the Tacoma bridge. There was some question as to which group of companies would pay this loss, but that point is not of moment here. The state claimed, at latest advices, a total loss which would amount to something over \$5,000,000; the final settlement might take some months. (See also INSURANCE, FIRE.) (E. R. H.)

Fires and Fire Prevention: see STANDARDS, NATIONAL BUREAU OF.

THE FIRE FIGHTERS OF LONDON did heroic service 24 hours each day after Germany began mass raids on the city in Sept. 1940

Fish and Wild Life Service.

The Fish and Wild Life service was established in the United States department of the interior on June 30, 1940, consolidating the bureau of biological survey and the bureau of fisheries, in accordance with the president's Reorganization Order No. III. Under Dr. Ira N. Gabrielson, director, former chief of the biological survey, the service includes divisions of wild life research, fishery biology, federal aid in wild life restoration, land acquisition, wild life refuges, construction and Civilian Conservation Corps operations, game management, fishery industries, fish culture, Alaska fisheries and predator and rodent control. W. C. Henderson, former associate chief of the biological survey and Charles E. Jackson, formerly deputy and acting commissioner of fisheries, are assistant directors.

Outstanding problems of 1940 related mainly to effective organization and to the relationship of the service's work to the needs of national defence. The wild life division of the National Park service was transferred to the biological survey before the establishment of the new service. The service's field work was reorganized in five regions, instead of nine, with headquarters in Portland, Ore.; Albuquerque, N.M.; Milwaukee, Wis.; Atlanta, Ga. and Boston, Mass. Establishment of the new service was the climax of the year's organizational changes.

Wild life conservation which helps to make "a country worth living in" plays an important part in national defence preparations by helping to build up individual and national morale. More tangible emergency contributions have also been pointed out. The value of the food resources in fishes, for example, has been emphasized in many ways, including the establishment of radio bulletins in Boston, Chicago, Jacksonville and New Orleans for the daily broadcast of market news reports to encourage the economic and profitable use of fishes as food. Fisheries' personnel and material have been of assistance to the navy and the fishing fleet is regarded as a valuable reserve. The service is prepared to meet emergency needs for controlling the numbers of birds and mammals that destroy crops and livestock and to co-operate in other ways in the defence program. The importance of maintaining conservation policies during the stress of emergencies, as well as at other times, and avoiding unwise exploitation has been emphasized.

The actual work of 1940 was in the main a continuation of programs already under way. Six new laboratories for fishery research were established, bringing the total to 11, including a new floating laboratory for studies on the fisheries' grounds. Research on birds and mammals continued in the field and in laboratories, including two new ones at the Patuxent Research Refuge, in Maryland.

Statistics compiled indicated that in 1938, the latest year for which complete data are available, the landings of United States fishing craft totalled more than 4,250,000,000 lb. The wholesale value of fishery products exceeded \$251,000,000. About 250,000 persons were employed in capturing, processing and wholesaling the catch. Estimates compiled indicated that the big game population of the United States in 1939 was more than 5,800,000. The annual waterfowl inventory in Jan. 1940 resulted in an estimate of more than 65,000,000 ducks and geese, representing the fifth consecutive annual increase as a result of the restoration program. Compilations of state reports indicated that in the 1938-39 seasons more than 7,858,275 persons paid a total of \$10,837,168 for fishing licences and more than 7,500,000 paid a total of \$12,600,000 for hunting licences. Sales of the federal stamp required of all over 16 years of age who hunt migratory waterfowl continued to increase, a total of 1,111,561 stamps having been sold in the 1939-40 year.

The federal wild life refuge system increased to a total of 263

refuges, with an acreage of 13,595,812. Output of fish and eggs at the 110 federal hatcheries during the year ended June 30, 1940, approximated 7,400,000,000, a drop from the 1938-39 8,042,000,000 attributed mainly to curtailment of cod, haddock and flounder production; 24 out of the 45 species handled were distributed in increased numbers.

Regulations governing migratory-bird hunting in 1940 provided a 60-day hunting season in each of 3 zones, an increase over the previous 45-day season, but shortened seasons on woodcocks and reduced bag limits on geese, mourning doves and white-winged doves.

The program for aiding the states in wild life restoration became more extensive and more effective. In all, 237 projects were begun by the states with federal aid during the year ended June 30, 1940, involving \$2,082,735, a great increase over 1938-39, first under the program, when 58 projects were begun at a cost of \$343,932.

An increased federal appropriation of \$2,300,000 became available on July 1 for this program, which provided for federal payment of 75% of the cost of projects carried on by the states with federal approval. (See also BIRD REFUGES; WILD LIFE CONSERVATION.)

Publications in 1940 included the following: Wildlife Research Bulletin 1, *Food Habits of a Group of Shorebirds: Woodcock, Snipe, Knot, and Dowitcher*; Technical Bulletin 711, *Economic Status of the English Sparrow in the United States*; Investigational Report 34, *Home Canning of Fishery Products*; Bulletins 31 and 32, *Natural History and Method of Controlling the Starfish and The History and Development of the Fisheries of the Columbia River*; Miscellaneous Publication 355, *Hart Mountain Antelope Refuge*; Conservation Bulletin 1, *Attracting Birds*; and *The Birds of Oregon*, published by the Oregon State college, as a co-operative project. (H. Z.)

Fisher, Herbert Albert Laurens (1865-1940), British historian, was born in London, March 21, and died there April 17. For a biographical sketch see *Encyclopædia Britannica*, vol. 9, p. 291.

Fisher, John Stuchell (1867-1940), U.S. attorney and state governor, was born in South Mahoning township, Pa., May 25, and was graduated from the Indiana (Pa.) State Normal school in 1886. He was admitted to the bar in 1893 and practised in Indiana. He was a member of the state senate for eight years and was chairman of the committee which reported on frauds in connection with furnishing the new state capitol. He was appointed state commissioner of banking in 1919 and was elected governor of Pennsylvania on the Republican ticket in 1926. On the expiration of his term he opened a law office in Pittsburgh. He died in that city June 25.

Fisheries. The fisheries of the world, according to the tabulation of the U.S. Fish and Wild Life service, annually yield about 17,500,000 tons of 2,000lb. each, of food and industrial products, with a value of about \$759,000,000. The fisheries conducted in the North Atlantic area by bordering countries produce 7,500,000 tons, valued at \$371,000,000; with the production by eastern North Atlantic countries amounting to 6,100,000 tons, valued at \$310,000,000, and by western North Atlantic countries to 1,400,000 tons, valued at \$61,000,000. The species of importance in the North Atlantic area include herring, cod, haddock, mackerel, halibut, swordfish, crabs, shrimp and oysters. The production of some of these species has declined, due to over-fishing or other causes. As this is a threat to the livelihood of many hundreds of thousands of fishermen and shore workers and to the food supply of nations, the various governments concerned took steps in previous years to conserve and sustain these fisheries. During 1940, however, because of the need for foodstuffs, created by the war situation, little was accom-

plished in this direction. In fact, in some of the warring countries conservation regulations were relaxed in an effort to increase fish production, without regard to the effect of unrestricted operations on the maintenance of fish supplies in the sea. Many other countries having access to fishery resources and not engaged in hostilities were in 1940 making every effort to exploit their fisheries.

As a result of the war in Europe fishing operations by the warring nations were considerably curtailed during 1940. In Great Britain alone, it has been estimated that well over one-half of the fishing fleet was taken over by the admiralty. The remainder found it difficult to conduct fishing on the usual banks. In order to make up for the deficiency of its domestic fisheries, Great Britain, especially England, therefore looked to other countries for a source of fishery foods. Early in 1940 large supplies of fresh fish were imported from Norway and the low countries. After the domination of these countries by the reich these sources were cut off and considerable dependence was placed in supplies of frozen cod fillets from Newfoundland and Canada and canned fish from various countries. Because of difficulties in securing refrigerated cargo space on transports and of holding chilled fish in cold storage in England, the importation of frozen fish was not entirely successful. Furthermore, since the English people have been accustomed to eating the domestic catch of cod in fresh condition, frozen fish of this species did not find ready sale. As a consequence there was a falling off in the fresh fish business due to the shortage of raw fish and resulting higher prices. The black-outs also were reported to have had an effect in curtailing fish sales, for they kept people at home away from the fried fish shops, a channel through which up to 70% of the fresh fish supplies of England have been marketed in normal times. England, however, took considerable amounts of frozen fish during 1940 and large quantities of tinned fish, such as salmon and sardines originating to a great extent in the United States and Canada. A schedule of maximum selling prices for canned salmon, sardines, herring and pilchards was placed in effect in Great Britain under orders of the ministry of food, with apparently little interference with normal trade conditions.

While the situation in the warring countries was not conducive to normal fishing operations during 1940, various other countries took renewed interest in exploiting the fishery resources. For instance, Portugal increased her codfishery on the Grand Banks off Newfoundland with financial and other assistance from the government. During three successive seasons the catch has increased progressively, the catch in 1939 being double that of 1934 and five times that of 1930. The position of the Portuguese canned sardine industry also improved in 1940, due to a larger catch than in recent years and also to orders from warring countries, especially England. Portugal also made an effort to expand sales of canned sardines in the United States to replace diminishing imports of this product from Norway. In this connection Egypt, during 1940, also offered encouragement toward the establishment of a local sardine-canning industry.

Spain planned to construct a new codfish processing plant to be supplied by a fleet of six large fishing vessels. Rumania, with the assistance of German credit, modernized its fishing fleet in the Black sea. In South Africa the production of frozen spiny lobster tails has assumed large proportions. Increased refrigeration facilities have been installed on transports touching at Cape Town to ship this product to various ports in Europe and the United States. Iceland effected improvements in the fishery industry toward maintaining her place as a fishery export country.

In Japan a merger was effected of various fishery sales companies whereby the sales to exporters of canned marine products, except salmon and crabs, were handled by one firm which exercised

control over prices and distribution. It was expected that large part of the production handled by the new concern would be sold to the military and foreign currency countries. In Australia the output of tinned fish was expanded. The Malay government also encouraged the development of local fisheries, which yield about 100,000 tons annually. Schools were established to give instruction to native fishermen in navigation, use of powered craft, construction and operation of nets, handling and marketing of fish and other related subjects.

The fisheries of North America, which annually yield over 3,000,000 tons on both coasts and in the interior waters, were prosecuted with renewed vigour in 1940. In Canada efforts were made to increase production of frozen and tinned fish to meet the demand for food in Great Britain. However, the pack of salmon in British Columbia decreased slightly under the previous year. On the other hand, increased activity was noticed in the canning of herring. On the Atlantic coast of Canada large quantities of cod were frozen for the export market. In spite of the latter development it was necessary to continue various types of government bounties to aid in improving the lot of the Canadian fishing population, especially in the maritime provinces.

In Newfoundland the government continued its efforts to improve the economic status of the fishing industry. Facing a decline in the export market for salt cod, which is the main outlet for this product, steps were taken to reduce costs of fishing by exploring new and more productive fishing grounds and by developing more efficient gear. Further aid was extended to the fishing industry by establishing fishing guarantees and shipbuilding bounties, by encouraging co-operative associations among fishermen to reduce marketing costs, and by the development of more exportable fishery products, such as frozen fish for the European trade and cod liver oil of higher quality.

The position of the fishing industry in the United States improved during 1940, brought about largely by a higher price structure resulting from curtailment in the production of some species of fish and increased activity in some branches of the fisheries due to anticipated war orders. A strike of the fishermen working on a number of large fishing vessels operating out of Boston, Mass., curtailed fish landings at that port during the late spring and early summer. Further curtailment in fishing effort was brought about by the government purchase of a number of fishing vessels on the Atlantic and Pacific coasts, during the latter half of the year, for conversion into naval craft. This stimulated the construction of new fishing vessels for replacement purposes.

It was reported during the early fall that Japan had given notice of its intention to terminate the international convention for the conservation of the North Pacific fur seal. Signatory countries to the convention, made effective in 1911, are the United States, Great Britain, Japan and Russia (U.S.S.R.). Any treaty power may terminate the treaty by giving one year's written notice to all other parties to the treaty. In 1940 the fur seal herd of the Pribilof islands, administered under the convention by the department of the interior through the Fish and Wildlife Service, numbered over 2,000,000 animals. When the treaty came effective the herd numbered about 125,000 animals. In the interim, to and including the season of 1940, about 800,000 seals plus animals were taken under regulated conditions for their pelts. Proceeds from their sale each year have been divided among the signatory countries.

The production of canned salmon in Alaska was less in 1940 than in the previous year, due mainly to the smaller output of salmon in the Bristol bay region. Packers' stocks of all grades of canned salmon at the beginning of the last quarter of 1940 were about 1,600,000 standard cases, or about 800,000 cases less than

hand at the same time in 1939. The situation in the salmon industry encouraged the canning of larger quantities of tuna, sardines and mackerel. Increased quantities of fish and shellfish were frozen during 1940.

The U.S. government sponsored an expedition to explore areas for king crabs off the Alaska peninsula and to conduct studies in the capture and canning of this shellfish. Two vessels were used on the expedition—one a crab-fishing vessel and the other a factory ship, on board which the crabmeat was canned. Operations were centred off the south coast of the peninsula during the summer and fall. The expedition returned to Seattle, Wash., in the middle of December for reoutfitting. It is planned that a second expedition will be dispatched early in 1941 to fish off the north coast of the peninsula. The U.S. government hopes this exploratory investigation will encourage U.S. interests to enter this fishery, which heretofore has been tried on by Japanese vessels and fishermen.

In various countries of South and Central America an interest was shown in exploiting local fishery resources. Attention was directed mainly toward producing marine products for domestic consumption to replace foods from abroad. In this connection individuals from several South American countries made investigations of the fisheries in the United States, and under the U.S. government's program for co-operation with other American republics several were assisted in fishery matters.

Increased activities toward co-operative effort among fishermen were reported during 1940. The associations of lobster fishermen in Newfoundland were the largest shippers of this shellfish from Newfoundland. Higher catches prevailed. The lobster fishermen of Canada, many supplying lobsters to co-operative canneries, were not in such a favourable position. Because of restrictions on the importation of canned lobster in the United Kingdom and France, about 85% of the foreign market was eliminated. Therefore, after the War Measures act the Canadian government was empowered to export a limited amount of canned lobster for sale in whatever markets could be found and an additional fund was set up to conduct an advertising campaign for canned lobster. Purchase of the product by the Canadian government was dependent upon a showing that the packers did not pay below a certain minimum prices to the lobster fishermen for the catch.

In Newfoundland efforts were directed toward developing co-operative societies among cod fishermen who have been in a depressed condition because of the falling off of the export markets for salt cod. Reports from Newfoundland indicated that one co-operative controlled one-fourth of the herring marketed in that country. These fish were marketed through some 100 small co-operative societies. A fish-marketing co-operative was formed in Sweden which is owned in part by fishermen on the west coast of the country. In British Columbia a cod fishermen's co-operative association was organized which aided in stabilizing the marketing of "lingcod" caught by its members. Several credit unions were formed among the fishermen in this province. On the east coast of Canada, in New Brunswick and Nova Scotia, several new fishermen's associations were formed which successfully handled fresh and canned fish.

During 1940 unusual interest was evidenced by various countries in securing an adequate supply of fish oils, potent in vitamins A and D. Exports of cod-liver oil from Norway to the United States declined during the latter part of the year and practically ceased after Norway was occupied by Germany. Canada prohibited the export of cod-liver oil except under licence approved by the Wartime Prices and Trade board. A strong demand, at prices higher than in the United States, resulted in increased shipments of Newfoundland cod-liver oil in favour of Great Britain. In view of this condition, manufacturers and importers of vitamin fish oils in the United States exerted efforts to augment domestic supplies. Toward this end a rather extensive fishery was developed in California for soupfin sharks, the liver of which is potent in vitamin A. The meat of this shark is of little commercial value. This is the first instance in the U.S. where a fishery has been developed because of an unusual value being placed on a visceral organ. The manufacture of synthetic vitamin D has received impetus because of world events. One such product is based on irradiated cholesterol derived from sea mussels. The manufacture of this product has also created a new fishery for sea mussels which is conducted along the coast of Virginia. Heretofore this mussel had little or no market value. In the United States interest also was shown in the extraction of vitamin A and D concentrates from certain low-cost fish oils, without rendering the original oil unfit for normal use in the manufacture of soap, paint and other products.

Whaling.—Since 1920 the whale fisheries of the world have been prosecuted with renewed vigour. Operations have been centred almost entirely in the Antarctic. Previously little whale fishing was done in this area because of dangerous weather and ice conditions. Such adverse conditions now, however, are no obstacle to the staunchly built factory ships and killer tugs. The take here has been enormous. During the period from the season 1939–40 (the inception of the fishery on a large scale in the Antarctic) to 1938–39 season, inclusive, 421,708 whales were captured in this region, from which 32,741,897 bbl. of oil were produced, according to report XIV 40) of the Committee for Whaling Statistics, Oslo. One barrel of about 32 gal. equals one-sixth ton. One ton equals 1,016 kg. or 2,240 lb. During the 1938–39 season alone 38,356 whales were captured in the Antarctic fishery, yielding 2,820,777 bbl. of oil. This was less than the production during the previous season. British whaling accounted for 11,192 whales and 891,791 bbl. of oil; Norwegian, 11,521 whales and 842,712 bbl. of oil; Japanese, 7,540 whales and 483,476 bbl. of oil; German, 5,066 whales and 1,149 bbl. of oil; and whaling by craft of the United States, Panama and Argentina accounted for 3,037 whales and 228,643 bbl. of oil.

During the 1938–39 season 34 floating factories and two shore stations operated in the Antarctic. These were serviced by 281 catcher boats. During the same season 12,795 men took part in this fishery, of whom 7,517

were Norwegians, 2,793 Japanese, 1,386 German, 866 British and 143 others.

Preliminary figures indicate that the production of whale oil in the Antarctic during the 1939–40 season was approximately the same as in the previous season, although Germany did not engage in the fishery. Japan, however, about doubled her production. That of Norway was slightly higher while the production by the other countries was about the same, compared with the season 1938–39.

Apprehension as to the future of the whale fishery, in the face of such intensive prosecution, led to conclusion of an international convention between 26 powers for the regulation of whaling. This became effective in 1935. During the previous season (1934–35) an average of 211.4 whales were killed per catcher boat in the pelagic fishery of the Antarctic. Within two seasons (that is, by the season 1936–37) the average kill per catcher boat dropped to 178. More effective regulations seemed necessary, culminating in an international agreement for the further regulation of whaling which was signed in London, June 8, 1937, on behalf of the Argentine republic, commonwealth of Australia, Germany, the Irish Free State, New Zealand, Norway, the Union of South Africa, the United Kingdom of Great Britain and Northern Ireland and the United States of America. This agreement, which was in force in 1940, was further amended to restrict whaling as regards prohibiting the killing of humpback whales in the Antarctic, at a meeting in London in 1938. In 1939 another conference in London recommended the extension of this prohibition for another year. During the 1938–39 season the catch per killer boat in the Antarctic dropped to 136, the lowest ever recorded, indicating a considerable decrease in the yield of whaling. (See also OCEANOGRAPHY.) (R. H. F.)

Fitzgerald, Francis Scott Key (1896–1940), American novelist, was born in St. Paul, Minn., Sept. 24, and was educated at Princeton university. He left college during his senior year in 1917 to enlist in the army for service during the World War. His first novel, *This Side of Paradise*, a work describing the actions and emotions of irresponsible youth, was published in 1920. He published several other novels in later years, among them *The Great Gatsby*. He died in Hollywood, Calif., Dec. 21.

Five-Year Plan: see UNION OF SOVIET SOCIALIST REPUBLICS.

Flax: see LINEN AND FLAX.

Floods and Flood Control. *Federal.*—Construction on 185 congressionally-authorized flood control projects was completed or was under way in 1940. Surveys and the preparation of plans and specifications were also in progress for many dams and flood protection projects at still other localities throughout the United States.

In New England, construction was in progress on five dams in the Merrimac and Connecticut river basins. Construction of authorized levees and flood walls at seven principal cities along the Connecticut river in Massachusetts and Connecticut was approaching completion.

In the Ohio river basin above Pittsburgh two dams were completed and construction of two other dams was well advanced. Channel improvement of the Conemaugh river at Johnstown, Pa., was about 55% complete. Construction was initiated on the Youghiogheny dam and on the local protection project at Kittanning, Pa. Local protection projects in the Ohio river basin below Pittsburgh were completed for Middlesborough, Ky., and for sections of three other principal cities and were substantially complete at Ceredo and Kenova, W.Va. Construction was in progress in 1940 on the remaining sections of the above-referred-to three projects, and protection works were also under way at 11 other Ohio basin localities in Ohio, Indiana and Illinois and on several agricultural levee projects in the Wabash river basin.

In the southwest, Conchas dam on the South Canadian river in New Mexico was completed. Construction was under way on seven other dams in this area.

On the Pacific coast the projects for flood protection in the Los Angeles county drainage area and Santa Ana river basin, involving the construction of reservoirs, dikes and channel improvements, were progressing rapidly. Construction was under way on the Mud Mountain dam, Wash., and on two dams in Oregon. Twenty-two local protection projects along the Columbia river

and its tributaries in Washington and Oregon were completed and others were under way in 1940. (J. L. S.)

Floods.—The world experienced the most severe winter in years during Jan. and Feb. 1940. This was particularly true in Europe. With the advent of spring the usual floods due to melting snow and ice occurred in many regions and particularly on the Danube in southeastern Europe. Much damage was done by flood waters and crop damage was caused by the late cold spring which prevented planting.

In the southwestern United States sudden violent rainstorms called cloudbursts took their usual toll by causing violent streams to arise in usually dry gulches, with disastrous resulting damage to highways and railroads.

During the rainy season on various portions of the earth's surface floods occurred due to climatic conditions over which man has little or no control. Such floods occurred on the Ohio and Mississippi rivers in the United States, on the Hwang-Ho in China, the Ganges in India and the Nile in Egypt.

In California in February floods caused widespread damage closely approximating conditions in 1937 when severe damage resulted. During that month two distinct floods occurred on the Sacramento river, causing damage to ranches, towns, highways and railroads. The four-day rainstorm caused the Sacramento to pour over its levees on a 100-mile front, creating a lake which submerged some of the smaller towns under 20 feet of water. During that period the rivers of Oregon, Washington and British Columbia reached the flood stage.

There is little that man can do to protect himself from such floods as prevailed in California in 1940. Flood reservoirs, such as those projected by some engineers of the day, would be of trivial consequence in meeting such downpours and stream run-offs as those that occurred in some of the California sections. Under ordinary flood conditions they would doubtless prevent great damage at times, but when the heavens open, as they did during this period in 1940, and millions of tons of water are concentrated into the canyons and ravines within a very few hours, no ordinary works of man can hold them. Human beings must then pay for the advantages they acquired when they settled in the low spots.

In September in New Jersey and Delaware torrential rains caused destructive floods in scores of communities which caused five deaths. Hundreds of families were rendered homeless and the medical authorities took unusual precautions to prevent disease, such as typhoid fever, from spreading. These floods were caused by an Atlantic hurricane far out at sea, and there is nothing that man can do to prevent such a storm from playing havoc with homes, property, communications and human lives. The flood raced down the valley at 50 m.p.h. and cut off the drinking-water supply from many towns.

In September flood damage precipitated by a cloudburst in three northern Oklahoma counties was estimated at more than \$1,000,000 as the Arkansas river's overflow slowly withdrew from the little bottomland towns of Jenks and Bixby.

The Red Cross and the civilian conservation corps made a survey of the Bixby-Jenks area in southern Tulsa county, where the loss was estimated at \$750,000.

In November portions of New Mexico, Oklahoma and Texas were swept by floods which carried away homes, farm buildings and livestock. Five Texas rivers were on the rampage. Whole families sought safety in treetops as the floods swept away their homes and livestock. Twenty-one inches of rain fell during one storm in certain sections of Texas.

Reforestation and improved soil management are vital problems, not only as methods of flood control, and their wide adoption would have a pronounced influence on the prevailing state of

the agricultural and lumbering industries. The correct solution to the problems presented by floods can only be obtained by a firm and scientific understanding of all the contributing causes of flood disasters.

Definite progress also has been made in solving the problem due to soil erosion. The introduction and practice of strip cropping, more sod and pastures, and terracing have reduced not only soil erosion but have reduced the damage due to floods in some areas. (Ro. St.)

Europe.—Although there have, from time to time, been reports of local flooding in areas of Europe during the year 1940, little information on any constructive work on flood control was forthcoming from the belligerent countries. Elsewhere, however, work on this problem continued on an impressive scale.

Iraq.—The building of the Haifa pipe line brought prosperity to Iraq and this prosperity was being wisely used for the benefit of the agriculturist by a continuation of the policy of checking excessive flooding in the wet season by the storage of water for irrigation in the dry. Following the construction of the Kut barrage across the Tigris, works were in progress on the Tigris river drainage and the construction of spurs on its two banks, the construction of bunds for the protection of the capital against flood dangers; the canalization of the Gharraf zone; the construction of the Yaso regulator in the middle Euphrates and other regulators at Ramatha, Dagharan and Fawar; the construction of the permanent Diyala weir on the river Diyala for feeding the canals with sufficient water during the low water season and the construction of another branch of the Abu Ghraib canal in the neighbourhood of Baghdad. Investigations were in progress to find reservoirs at Tawillah on the Diyala, at Shari on the Tigris and at Thartor valley on the Euphrates.

Two other great projects were sanctioned. One was the revival of the Shatt el Shamiyah, one of the main branches of the Euphrates, by excavating the silted river by dredging and the construction of regulators. The second was the revival of the Habbaniyah scheme, put before the Turkish government in 1911 by Sir William Willcocks, urged again in 1920 by British authorities and approved in 1940 for execution.

By excavating a channel from the Euphrates near Ramadi to L.L. Habbaniyah the excess waters of the Euphrates during the floods are to be drawn off, thus protecting towns and cultivation on the two banks against inundation. The water thus stored will be diverted back later into the river to raise the level during the low season. A second channel from L.L. Habbaniyah to the depression of Abu Dibbis discharges surplus water from the lake, leaving it relatively empty and ready for any eventuality in the following flood season.

India.—The floods which periodically devastate Orissa are principally due to heavy rains in the Central Provinces and, as in Iraq, efforts were being made to divert the surplus water to useful purposes. A special irrigation division was created to erect embankments and a preliminary survey of 15 irrigation works was undertaken, of which four from Sambalpur and one from Ganjan were considered to be practicable and paying. The question of damming the rivers in these districts was investigated and the improvement of Orissa canals and of the Rismikulya system also undertaken.

From the many studies made of the precise cause of the recurring floods in Bengal, it would appear that the main factor is the misuse of land in provinces and independent states far outside her border, whence come many tributaries of the Ganges as well as the Ganges itself.

In the Himalayan region there is no organized forest protection or conservation of natural vegetation without which it is axiomatic that the extension of floods and the velocity of erosion must get steadily and ever rapidly worse. In the plains, where there is much uncultivated waste land the depredations of domestic animals destroy the vegetation. Simultaneous greater volumes of water are trying to rush down from the barren land and the denuded upper catchment area. An interim Ganges flood committee was appointed to tackle a problem which must be solved for the welfare of the millions that inhabit the Gangetic plain and which simultaneously appears to be practically insoluble on an adequate scale.

Australia.—In South Australia extensive diversions of the upper waters of the river Murray have led to the flooding of the lakes at its mouth with salt water, with resultant heavy loss to the landholders bordering the lake and on the reclaimed irrigation area around Wellington. An agreement made for the regulation of the flow of the river Murray and the Godwin barrages were the final works being constructed in this connection. They comprise five structures and connecting embankments across the five channels leading from Lake Alexandrina to the Murray mouth and are known as the Goolwa barrage, Mundoo barrage, Boundary creek barrage, L. island channel barrage and Tauwither channel barrage. During flood periods, approximately 70% of the river flow passes through the Godwin channel, 10% through the Mundoo channel and the balance through the other three. From the construction point of view the most important is that through the Goolwa channel. (See also DAMS; FORESTS; IRRIGATION; METEOROLOGY; SOIL EROSION AND SOIL CONSERVATION.) (J. E. U.)

Now: THE MAIN STREETS of Shanghai were under several inches of water in the fall of 1940 as the Yangtze overflowed its banks

Florida, extreme southeastern state of the United States, is called the "Peninsula state" because of its peculiar outline. Its coast line is greater than that of any other state, extending 472mi. along the Atlantic and 674mi. along the Gulf of Mexico. Its total area is 58,666 sq.mi., of which 3,805 sq.mi. are water surface. Florida contains about 30,000 lakes, many of them connected by subterranean channels. Population (U.S. census 1940) 1,897,414. According to this census, the largest cities were Jacksonville, Miami and Tampa, with populations of 173,065, 172,172 and 108,391 respectively. Tallahassee, the capital, had a population of 16,240. For population of other cities see CENSUS, 1940.

On distribution of population the latest available figures (state census 1935) gave a total population of 1,606,842, of which 1,139,063 were white and 463,205 Negroes; only about 45,000 were foreign-born. In the 1940 census 1,045,791 were urban and 851,623 rural.

History.—In the 1940 presidential election Roosevelt received 360,407 votes; Willkie 126,412. All five of the state's representatives in congress, and senators Andrews and Pepper are Democrats. Senator Andrews was re-elected in Nov. 1940. Pepper was elected in 1938.

The state elective administrative officers, whose terms expire in Jan. 1945, are: Spessard L. Holland, governor; R. A. Gray, secretary of state; J. Thomas Watson, attorney-general; J. M. Lee, comptroller; J. Ed. Larson, state treasurer; Colin English, superintendent of public instruction; and Nathan Mayo, commissioner of agriculture.

Education.—More than 3,500 students are regularly enrolled in the University of Florida and more than 1,960 in the Florida State College for Women. Municipally operated institutions of learning are: the University of Miami, the University of Tampa and St. Petersburg college. Stetson university and Rollins and Southern colleges are well established privately endowed institutions.

The biennial report of the state superintendent of public instruction showed a total enrolment in the public schools of 396,824, of which 292,959 were in schools for whites and 103,865 were in Negro schools.

State appropriations for higher education for the year 1938-39 amounted to \$2,299,760.

Banking and Finance.—The latest available figures on the state's financial condition, taken from the annual report of the state treasurer for the fiscal year ending June 30, 1940, show a total balance in the treasury of \$12,121,147.86.

The total bank deposits in Florida national and state banks, on the basis of latest available figures (June 30, 1940), were \$451,832,000.

Agriculture, Manufactures and Minerals.—Agriculture is the most important industry in the state. In 1935, the year of the state census, there were 72,857 farms with a total acreage of 6,048,406ac., of which 1,142,767 were in crops, 489,006 were idle (fallow), 2,362,674 were in pasture, 1,140,941 were in farm woodland and the rest mainly in fruit.

The table shows the more important crops for the 1940-41 season.

Important Crops in Florida for the 1940-41 Season

Crop	Acres	Production	Value
Oranges (including Tangerines) . .	..	29,800,000 boxes	\$37,250,000
Grapefruit	..	21,000,000 boxes	21,000,000
Tomatoes	31,500	3,225,000 bu.	7,417,500
Snap beans	52,000	5,090,000 bu.	3,817,500
Celery	7,500	2,280,000 crates	5,700,000
Corn (Maize)	821,000	9,031,000 bu.	5,960,400
Tobacco	16,700	10,123,000 lb.	3,224,000
Irish potatoes	28,000	4,312,000 bu.	5,174,000

On Jan. 1, 1940, the livestock resources of the state were 711,000 beef cattle, 110,000 milch cows, 555,000 swine, 37,900 sheep, 19,000 horses and 41,000 mules. The more important manufactures of the state were lumber, naval stores (turpentine and rosin) and cigars.

In the 12 months' season, April 1939 to March 1940, Florida produced 5,172,550gal. of gum turpentine valued at \$1,309,170 and 345,000bbl. (500lb. each) of rosin valued at \$3,360,000. The estimated 1939 lumber output was about 670,000,000 bd.ft. mainly yellow pine and cypress, representing a value of about \$21,000,000.

The cigars manufactured yearly in Florida represent approximately \$20,000,000; the centres of the industry are Tampa and Jacksonville. Two of the newer industries are the growing of tung nuts and the production from them of tung oil and the making of paper from pine pulp.

The state has only limited resources in minerals, but has large and valuable deposits of phosphates, lime and limestone, and large extensive, though highly valuable, deposits of kaolin and fuller's earth. The annual production of phosphates is valued at about \$13,000,000. Florida shares with California a large winter tourist trade and the operation of resort hotels and apartment houses, especially in the southern part of the state, is an extensive business.

Probably the most significant development of 1940 was the building of Camp Blanding, near Starke, which is almost completed, and which will have a capacity for training about 70,000 troops, under the national defence program. (J. M. Lee)

Flour and Flour Milling. The year 1940 marked the beginning of a new era in wheat flour manufacture. Since the advent of vitamin- and mineral-fortified white flour in the British Isles and the United States, it can be said more truly than at any time since the introduction of patent flour that "bread is the staff of life." From the moment that Robert Boothby, parliamentary secretary to the ministry of health, announced on July 18, 1940, that the British government had developed plans for the fortification of all bread flour by the addition of synthetic vitamin B₁ (known as aneurin in the British Isles, and as thiamin chloride in the U.S.), flour has taken on a new and greater significance in the nutrition of English-speaking peoples.

In Britain one-fifth of a gram of pure crystalline aneurin and 100 grams of calcium will be added to each sack of flour at the mill. Imported flour, unless previously fortified by the manufacturer according to these specifications, will be likewise augmented before distribution to bakers. Although the cost of aneurin would make this fortification rather expensive, it is expected that large scale production of vitamin B₁ in a plant which should be ready for operation early in 1941 will reduce costs so that the increment of expense in making a two-pound loaf of bread should be all but one-tenth of a cent (one-twentieth of an English penny), according to Mr. Boothby's estimate.

In the U.S. one of the outstanding milling organizations

initiative in offering the bakers a white patent flour containing all the principal dietary essentials found in whole wheat. This is accomplished by the addition of organic iron, calcium, phosphorus and vitamin B₁ in the same proportions as these substances naturally occur in the whole-wheat berry. Vitamin B₂ riboflavin is also added in quantities which restore the vitamin level to that of whole-wheat flour. The interest shown in this new fortified flour in 1940 indicated that other large millers may be expected to follow with similarly improved products in the near future.

While this forward step in flour manufacture has the aspects of a wartime measure in the British Isles, it is worth recording that about 1936 research work relating to the addition of vitamin to bread was started by the Millers' Mutual association. Even before then nutritional research in connection with the fortification of patent flours was undertaken in the U.S.

Investigations of milling problems also turned toward vitamin B₁. "The Thiamin Content of Whole Wheat and Clear Flours" is the subject of a study by C. Hoffman, *et al.*, who found that the thiamin content of clear flours had a definite relation to the ash content and varied from 2.0 to 4.7 gamma per gram. Earlier work relating to this subject has been published by M. Copping and M. H. Roscoe; A. S. Schultz, Atkin and Frey; R. Williams and T. D. Spies.

Experimental milling methods were studied by Edwin Ziegler, who points out the need for standardization of the experimental milling test. In Ziegler's review of the factors involved in milling it appears that from the experimental standpoint, at present, only a relatively small number of isolated factors have been investigated. In general it appears that commercial practice has felt its way along without benefit of laboratory research, and that with the exception of the pioneering work of O. Swanson and J. T. Willard in 1911 relatively little was published in this field prior to 1925, and not a great deal since then. In his investigations on "The Effect on Diastatic Activity of Surface, Pressure, Differential and Temperature of the Reduction Rolls in Milling" Ziegler not only pointed out some significant relationships between the maltose values of flours and milling methods, but also reopened a fertile field for further investigations in experimental milling. From the chemical standpoint an interesting contribution to recent literature is a study of "The Function of the Lipids in Milling and Baking" by B. Sullivan, who points out that many of the peculiar properties of flours are related to the lipids which "are either adsorbed, or in complex formation with the proteins," and that "from 5% to 10% of the weight of the gluten is lipid material."

With the launching of new research projects on agricultural products at the four new regional laboratories scheduled for the early part of 1941, it is to be expected that at the northern laboratory, at Peoria, Ill., where major attention will be given to the products of corn and wheat, a new impetus may be given to the investigation of flour and flour-milling problems. (See also **FEED AND BAKERY PRODUCTS; VITAMINS.**)

Fluorspar. The chief producers of fluorspar are the United States (32%), Germany (28%), Soviet Union (14%), France (10%) and United Kingdom (8%). The world

total is now about 500,000 metric tons. The United States output in 1939 was 173,000 short tons, shipments 182,800 tons, and consumption 176,800 tons, of which the iron and steel industry took 71%, glass and enamel 12% and hydrofluoric acid and its derivatives 15%; other uses are small. (G. A. Ro.)

Flynn, Edward Joseph (1892-), U.S. politician who directed the third-term campaign of President Roosevelt in 1940, was born in the Bronx, New York city. He first made the acquaintance of Roosevelt while he was a member of the New York state assembly, to which he was elected in 1918 after graduating from the law school of Fordham university. When he was elected sheriff of Bronx county in 1921 he became political boss of the borough under the tutelage of Tammany Hall. Later he supported James J. Walker for mayor of New York city, and when the latter was elected Flynn was appointed city chamberlain as a reward for his political support. Roosevelt, upon becoming governor in 1929, selected Flynn as his secretary of state, which office he retained under Gov. Lehman until Jan. 1, 1939, when he became U.S. commissioner general to the New York world's fair. President Roosevelt appointed Flynn chairman of the Democratic national committee Aug. 1, 1940, to succeed James A. Farley.

Football. With the east and the middle west heading the parade, both in the number of strong teams and the attendance figures, intercollegiate football enjoyed a flourishing season in 1940. The nation's first peacetime conscription may make heavy inroads on the sport in 1941, but in 1940 there was no letdown either in the quality of the play or the public's interest. The usual big crowds turned out each week, in spite of the country's concern with the war in Europe and the bitterly contested presidential election. The dropping of football by the University of Chicago at the close of the 1939 season failed to set a trend, as had been predicted, though some significance was read into the statement by Yale's athletic head committing Yale to a continuing policy of de-emphasis regardless of how badly its teams fared on the gridiron.

Apparently there is little immediate prospect of any general deflation in college football so long as the sport continues to carry the burden of the entire athletic structure at most institutions of learning.

The public's interest and support of the sport is reflected in the gathering of 102,000 that filled Philadelphia's Municipal stadium to see Navy defeat an Army eleven that had not won a major victory since 1938. Pennsylvania and Cornell, meeting for the Ivy league honours, attracted 80,000 to Franklin field, Philadelphia, where Frank Reagan closed out his career by leading Penn up from a 13-0 deficit to victory in one of the many thrilling games of the season.

On the same day, Stanford university, the surprise team of the year, defeated California before 80,000 at Berkeley, to win the Pacific coast championship and the Rose Bowl nomination. Army and Notre Dame played to 78,000 at the Polo Grounds in New York, and 73,000 saw Tom Harmon, the college player of the year and winner of the Heisman trophy, wind up his varsity career in the Ohio State stadium by breaking the 15-year-old scoring record of Red Grange. Notre Dame played to approximately 500,000 in nine games and Pennsylvania was close to that figure for eight games.

TOM HARMON, outstanding football star of 1940, making a gain for Michigan against Yale at Ann Arbor on Oct. 28, with the help of perfect blocking

Minnesota was ranked as the No. 1 team of the year in a national poll of sports writers. The Gophers went through one of the most exciting schedules of the season without being defeated or tied, although in two instances, against Michigan and Northwestern, their margin of supremacy was a point after touchdown. Their conquests included Washington, the second best team on the Pacific coast, Nebraska, the champions of the Big Six, and Ohio State, the 1939 champions of the Western conference, whom Minnesota succeeded. Behind Minnesota were ranked Stanford, whose coach, Clark Shaughnessy, serving his first year at Palo Alto after leaving Chicago, was rated as the coach of the year, Michigan, Tennessee, Boston college, Texas A. & M., Nebraska, Northwestern, Mississippi State and Washington.

Stanford, Tennessee and Boston college won all their games, as also did Lafayette college. Tennessee completed its regular schedule for the third successive season without being defeated or tied and carried off the Southeastern conference title again. Boston college was ranked the No. 1 team of the east. Michigan lost only to Minnesota, as also did Nebraska. Mississippi State was unbeaten but tied by Auburn; Northwestern lost to Minnesota and Michigan; and Washington to Minnesota and Stanford.

Texas A. & M. was regarded by many as the equal of any team in the country until, in its closing game, it met with a shocking defeat by Texas, despite the powerful smashing of its great full-back, John Kimbrough. The Aggies finished in a tie with Southern Methodist for the Southwestern conference honours but lost their chance to go to the Rose Bowl.

Stanford invited Nebraska as its opponent in the Rose Bowl at Pasadena and finished the season undefeated with a score of 21-13. Tennessee and Boston college met in the Sugar Bowl at New Orleans with Boston college defeating Tennessee 19-13. Fordham, one of the best elevens in the east, which lost only to St. Mary's, played Texas A. & M. in the Cotton Bowl at Dallas, with Texas winning, 13-12. In the Orange Bowl at Miami, the opponents were Mississippi State and Georgetown, which lost only to Boston college, by 19-18, in one of the outstanding games of the year, marking Georgetown's first defeat since 1937. The Orange Bowl winner was Mississippi State, 14-7.

Cornell and Notre Dame were two teams that ranked high for a good part of the season, only to topple finally. Cornell was the No. 1 team of the country for four weeks and then suffered the most shocking reversal of the year under unparalleled circumstances.

Unbeaten in 18 games, the Ithacans went to Hanover, N.H., to play a Dartmouth eleven that had lost four times. On the last play of the game, Cornell threw a touchdown pass and apparently won by 7-3, but two days later the moving pictures of the game established that the pass had been scored on an illegal fifth down. The referee, W. H. Friesell, admitted his error and Cornell, of its own volition, conceded the victory to Dartmouth by 3-0, the first time on record a score had been reversed in college football.

Notre Dame, fancied to have its best team in many years, disappointed in defeating Army only through an intercepted pass and in losing to Iowa and Northwestern.

There were no innovations of attack or defence in 1940. The forward pass was used more extensively than ever.

Professional football likewise enjoyed big favour. The Polo Grounds was jammed with 55,000 people when Brooklyn defeated New York, and thousands were unable to gain admittance to the play-off between the Washington Redskins and the Chicago Bears for the national championship at Washington. The Bears won by the staggering score of 73-0, the worst rout

in the history of the play-off.

Dr. Jock Sutherland, serving his first year in professional football, was the coach of the year in bringing Brooklyn up to second place in the east standing. Davey O'Brien, playing his last game for the Philadelphia Eagles, before forsaking football for a career in the federal bureau of investigation, set a record with 33 completed passes against Washington.

Canada.—In spite of the war, football continued to be played in the dominion, although intercollegiate competition was abandoned and players left their teams to join the colours. The east-west final for the championship was not held.

In lieu of this play-off, the championship of the C.R.U. was decided in the eastern series between Ottawa Rough Riders, interprovincial titleholders, and Toronto Balmy Beach, which won the championship of the Ontario Rugby Football union for the first time in a decade by defeating Sarnia 2-26th Battery, successor to the Sarnia Imperials. The Rough Riders won from Balmy Beach to win the C.R.U. crown. The Winnipeg Blue Bombers, who defeated the Rough Riders in the 1939 east-west dominion championship play-off, won the Western Interprovincial Football union honour again, vanquishing the Calgary Bronks in the play-off. (A. DAVENPORT)

Great Britain.—There was plenty of football of all kinds played in the season 1939-40. Rugby union, Rugby league and association, in spite of the difficult conditions. In the Rugby union world the game was so well organized as the season advanced that it was possible to play a couple of international matches between England and Wales and a couple of university matches. The international matches were played at Cardiff and Gloucester and England won them both, fairly easily, too. On the England side F. G. Edwards (Gloucester) took Cranmer's place in the centre in the last matches and played splendidly each time, his marking of Wilfred Wood making England's task very much easier. T. A. Kemp and the ubiquitous J. Ellis made a capital pair of halfbacks.

The first university match was played at Cambridge, and Oxford won easily, thanks mainly to their brilliant backplay, where G. A. Hollis (captain) and R. E. Luyt made a very good wing indeed. On paper, it looked as though Oxford would do the same in the return match, and it did until half time, but then C. L. Newton Thompson, the Cambridge captain, pulled his forwards together and led them superbly to beat Oxford just on time. E. R. Knapp scored all the four tries that Cambridge obtained in the second half.

There was a memorable match played in Paris between the British and France, captained by the Irish international, H. J. Sayers, and the French captain, This was the strongest Rugby side that ever left British shores and the man was at his best. So it is no wonder that the French side was badly beaten. Here is the full British army side: V. G. Jenkins (Wales), E. J. Unwin (England), P. Cranmer (England), W. Wooller (Wales), R. H. Guest (England), F. J. Reynolds (England), J. Ellis (England), W. E. N. Davies (Wales), W. H. Travers (Wales), R. E. Prescott (Ireland), G. B. Horsburgh (Scotland), T. F. Huskisson (England), R. Mayne (Ireland), S. Walker (Ireland) and H. J. Sayers (Ireland). The outstanding club of the year was St. Mary's hospital, which T. A. Knapp captained. Among those who have been killed in active service in 1940 who were famous in the Rugby union game, were A. C. Jolensky, P. C. B. H. Black and E. J. Parsons, all four English internationals and the three Oxford blues as well.

The Rugby league game functioned, too. All the well known clubs, sides, both in Lancashire and Yorkshire, and the Lancashire cup finally won by Swinton, which beat Widnes after extra time had been played. There was as much association football played as ever, if not so intensively as in the past. Instead of the ordinary leagues, regional competitions were held, England (with Wales) having eight regions and Scotland two, while Ireland won on as much as usual. Two international matches were played, England drawing with Scotland (1-1) at Hampden park, Glasgow, and losing to Wales at Wembley by a goal to nil. (D. R. C.)

Foreign Exchange: see EXCHANGE CONTROL AND EXCHANGE RATES.

Foreign Investments in the United States.

Foreign investments in the United States, long- and short-term, were estimated at \$9,462,000,000 as of the end of 1939. There was an increase of \$800,000,000 during the year, the net increase of \$1,000,000,000 increase in foreign short-term deposits in United States banks and a \$200,000,000 decrease in foreign holdings of United States common and preferred stocks. As a consequence of those conflicting trends, short-term assets comprised over one-third of the total foreign dollar assets whereas one year earlier they were less than one-quarter of the total.

Common stocks comprised, at the end of 1939, approximately 40% of the foreign long-term investments. Holdings of common stock have usually been the principal fluctuating element in foreign investments. That is partly because common stocks are valued on the basis of their market prices in investment markets. Equally important, however, is the popularity of common stocks as speculative media.

The increase in long-term investments in the United States during the last five years was stimulated primarily by the

ects of sharing in the benefits of relative prosperity in the United States, and by the desire to escape the periodic political crises and threats of war in Europe. Under those circumstances investments in common stocks naturally exceeded other types. The other types of investments—direct, preferred stock, bond and miscellaneous investments—changed relatively little in value, partly because of the bases of valuation and partly because they are not speculative types of investment.

Foreign Investments in the United States by Types of Investments, 1938-39
(Year-end data: in millions of dollars)

Types of Investment	1938	1939
Long-term investments:		
Direct investments (book value)	1,895	1,935
Common stocks (market value)	2,715	2,493
Preferred stocks (par value)	530	490
Bonds (par value)	580	570
Miscellaneous investments	750	750
Total	6,470	6,247
Short-term investments:		
Total	2,193	3,215
Grand total	8,663	9,462

Source: Long-term data from Finance Division, Economic Series No. 8, *The Balance International Payments of the United States in 1939*.
Short-term data from *Bulletin of the Treasury Department*, as adjusted in *The Balance of International Payments of the United States in 1939*.

Over 37% of the foreign long-term investments in the United States at the end of 1939, or \$2,348,000,000, was British and 10%, or \$1,060,000,000, was Canadian. The next largest investments were Dutch (\$888,000,000) and Swiss (\$746,000,000). Relatively, all of the others were quite small, notably Germany and Italy with investments totalling \$100,000,000 and \$40,000,000 respectively. Latin America, Asia, Africa and Australia combined had investments in the United States totalling only \$312,700,000. Stocks and bonds, that is readily marketable securities, comprised \$1,180,000,000 of the British long-term assets in the United States at the end of 1939. Similar assets comprised \$19,000,000 of the Canadian investments and \$767,000,000 of the Belgian and Dutch holdings. The other assets, although very valuable, were not as readily liquidated and, therefore, of more restricted usefulness.

Foreign countries were net sellers of United States securities during 1939 and during the first eight months of 1940. The United Kingdom and Canada made net sales in the amount of \$75,000,000 in 1939, followed by sales of \$72,000,000 from January to Aug. 1940. Belgium, Netherlands, Switzerland and the Scandinavian countries were heavy net buyers, their purchases reducing the net sales for the world to \$108,000,000 and \$32,700,000 during the respective periods.

Foreign short-term funds in the United States increased rapidly in 1939 through August, the beginning of the war. This influx of foreign funds was particularly rapid during and after the March crisis occasioned by the German occupation of Czechoslovakia. The increase in foreign central bank and government balances in United States banks was especially large and significant. These developments were traceable, of course, to the growing realization that war was inevitable.

After the war started there were two contrary movements in short-term investments, similar to the movement of United States securities. Belligerent countries were rapidly reducing their balances as part of their war effort. Britain, France and Canada, being unprepared for war, compared with Germany, were forced to expand their military machines to a very considerable extent through the purchase of planes and other equipment in the United States. The dollars with which to pay for these war purchases were obtained principally by selling part of their gold reserves and current gold production to the U.S. At the end of 1939, Britain, France and Canada had \$455,000,000, \$297,000,000 and \$288,000,000, respectively, short-term balances.

Neutral European countries increased their deposits in United States banks in 1939 and through Aug. 1940 as part of their efforts to protect their capital assets. Even the central banks shipped substantial portions of their gold reserves to New York. Some of this gold was sold and the proceeds deposited to their accounts and some was earmarked at the Federal Reserve bank of New York.

At the time of the war of 1914-18, the mobilization of privately owned foreign assets by the European belligerent countries was not started for at least a year and was not made obligatory until Feb. 1917. Upon the beginning of war in 1939, the British and French empires took steps promptly to ensure that the foreign exchange and other assets of their subjects and citizens were conserved. This was done, (1) by ordering the registration of all such assets, (2) by requiring that all transactions in those assets be licensed, and (3) by providing the machinery for the seizure of the securities and other assets by the governments. United States securities were requisitioned by the British government on two dates during the first year of the war: Feb. 17, 1940 when 60 selected corporate stocks were ordered turned over to the Bank of England and on April 13 when 92 stock and 23 bond issues were similarly called. Neither any of the dominions nor France had requisitioned any securities during 1940. Sales under these requisition orders were very small as was shown by the statistics of net sales.

A new policy affecting foreign investments in the U.S. was adopted by the government of the United States at the time of the invasion of Denmark and Norway. On April 10, 1940 an executive order was issued providing that transfers of credit, foreign exchange transactions, the export or earmarking of coin, bullion or currency, and other similar operations by persons or institutions in the United States, which involved Danish or Norwegian property, should be subject to licence by the secretary of the treasury. Similar executive orders were issued at the time of the subjugation of Belgium, Netherlands, Luxembourg, France, Latvia, Estonia, Lithuania and Rumania.

Foreign Missions. During 1940 the progress of the wars in Europe and the far east brought increased problems to Christian foreign missions. In the British empire and in the Netherlands East Indies the intensification of the struggle led to a more thoroughgoing internment of German missionaries than in the earlier stages of the conflict. Direct contacts were broken off between the supporting constituencies in several countries and their missionaries. This was true of the Germans, the Dutch, the Danes, the Norwegians, the French and the Belgians. In Great Britain heavy taxes and the evacuation of the members of scores of parishes, with the consequent disruption of normal church life, caused a decline in contributions to missionary societies. Difficulties in procuring foreign exchange hampered the transmission of funds. Christians of the United States were appealed to for increased giving to make up for the decline on the other side of the Atlantic. For the Protestants, the offices of the International Missionary council served as a channel for communication between missionaries and supporting constituencies who otherwise were cut off from one another and raised and transmitted funds to supply the needs of the “orphaned missions.” In Japan the accentuation of national spirit attendant upon the hostilities with China was accompanied by enhanced government control of the churches. The various Protestant bodies were constrained to take steps toward union. Because of national feeling, foreign subsidies to Japanese churches

were ordered discontinued and foreigners in executive positions were to be replaced by Japanese. Pursuant upon rising friction with Japan, the government of the United States advised its citizens in the far east to consider returning home. This led to the evacuation of many of the missionary staff from Japan, Chosen and China. Yet among the Chinese, missionaries and Christianity were in higher favour than ever before. In no land did missions cease in 1940. Means were found to continue them, even though in some regions with altered programs. (K. S. L.)

Foreign Trade: *see* INTERNATIONAL TRADE.

Forests. **United States.**—Public hearings held early in 1940 by the Joint Congressional Committee on Forestry—and testimony presented at those hearings by representatives of the general public, of forest industries and forest owners, and of community, county, state and federal governments—were significant. For testimony before this committee brought out that the best three-fourths of United States commercial forest land is in private ownership and that exploitation is still the rule whenever most private lands are operated. It also emphasized that the United States is still cutting, wasting and destroying old-growth and second-growth forests faster than it is producing usable new ones; and that although private forest lands most in need of rehabilitation coincide in general with areas of greatest rural unemployment, the United States has scarcely touched the work opportunities these and other forest lands afford.

From 1930 to 1940 congress passed many fundamental laws affecting lands within fences on farms; lands for which a comprehensive nationwide land-use program was in 1940 well under way. This helped turn the tide away from soil depreciation. It also helped agriculture deliver its full quota of food toward national defence and national safety. In the field of forestry, piecemeal legislation has been enacted in the past. But most current forestry action programs are inadequate and there was in 1940 urgent need for a more comprehensive and up-to-date one.

Endorsed by the department of agriculture, such an over-all program was recommended to the Joint Congressional Committee on Forestry by the federal forest service. Its purpose is to create and maintain a nationwide forest economy that will help solve problems of rural poverty and unemployment and create security and stability for those families, communities, regions and industries that depend upon the forest resource.

The first and major section of this recommended program centres on private lands. This is because they are the crux of the situation. Applied concurrently, the two parts of this section provide for (a) co-operation—effort and action by private owners as well as by public agencies, *including* public control as one of many co-operative aspects—and (b) extension of public—community, state and federal—ownership and management of forest lands.

The second section of the recommended program is designed to provide for protecting, developing and using forest land and its resources in public ownership and management—including the present national forest system—and those which come into public ownership and management. The third section has to do with more adequate provision for research with respect to private and public forest lands and their resources, and services—such as watershed protection, outdoor recreation and wildlife conservation—that forests render.

This recommended program pointed toward achieving sustained yield of the forest resource. It will not accomplish this purpose immediately. But it charts the course and proposes movement along that course as fast as possible.

Another significant forestry achievement during 1940 was the

sale, under one contract, of 425,000,000 board feet of softwood lumber that had been salvaged, by forest service direction, since the New England hurricane of Sept. 1938. This contract, made after full exploration of possibilities of selling direct to national defence agencies, and after reserving salvaged timber for local industries, provided that the price to be paid under it shall be adjusted to its actual market value every 90 days. Besides ensuring receipt of full market value, this may help make possible additional payments to farmers and others who originally owned the timber.

Another significant development during 1940 was the dropping of trained men and equipment from aeroplanes, by parachutes, to fight forest fires in rough and mountainous national forests in the west. In these operations, which make it possible to put major fires out more quickly, planes first release small parachutes to determine drift. Trained men follow. Using parachutes which permit a certain amount of steering, they carry lightweight radio with which they quickly get in contact with planes and headquarters. Tools, first-aid kits, and emergency rations are attached to separate burlap parachutes.

The national forests in 1940 totalled 176,567,095 ac. of federal land in 42 states and 2 territories. They protect huge portions of many major streams and furnish domestic water supplies for more than 400 cities and towns. At least 85% of all major western irrigation projects are dependent upon water from national forests. They are also the source of about one-third of the nation's potential water power, harbour approximately one-third of the nation's big game and provide an enormous area that can be used for recreation.

National forest properties in 1940 had about one-third of the commercially valuable saw timber of the U.S. Most of it is less accessible than privately owned timber, but this public resource is being built up through a planned program that includes intensive protection, planting, stand improvement, and enforcement of such cutting practices as will assure perpetuation of the source. When all national forest timber is under management and protection it should be able to provide, on a permanent basis, for an annual cut at least five times as much as that of 1940.

Sale of national forest timber, greater in 1940 than during any previous year, is but one of many activities aimed at specific social and economic needs. Others include: Regulating livestock grazing; determining ways to increase returns from farm wood lots; planting of shelterbelts to improve living conditions in the prairie plains region; and developing recreational facilities for low-income groups.

On the national forests these recreational facilities in 1940 included some 4,000 campgrounds. The forest service has made a definite start toward developing "organization camps" which are made available to such public welfare and other organizations as the Boy Scouts, Girl Scouts, Camp Fire Girls, Y.M.C.A., Y.W.C.A., 4-H clubs, Salvation army, and to church, fraternal, farm and labour organizations. The chief purpose is to provide health-giving outings for people who are less well-to-do and for children.

(E. H. CL.)

British Empire.—The war in 1940 had a very great effect on forestry in the empire. All other forestry activities had to be subordinated to production of timber and other supplies required by Great Britain for prosecution of the war. The spread of war to northern Europe cut off trade with Russia, the Baltic states and Scandinavia which provide in peacetime a large proportion of the imports of timber. Control of timber supplies was instituted at the start of the war and strenuous efforts were made to increase the volume of supplies of home-grown timber and, so far as shipping was available, to increase imports from North America, especially British Columbia. With the active co-operation of the timber trade and forest departments in Canada, supplies were being turned out at a steadily increasing rate and all previous records of output from British Columbia were exceeded.

Forest officers and woodmen from Great Britain, Canada, Australia, New Zealand and Newfoundland were drafted into a forestry corps as part of the regular army. Before the capitulation of France they operated mainly

at country, but were subsequently employed on the extraction and conservation of timber for war purposes in Great Britain.

The preservation and improvement of forests necessarily had to give way for a time to measures connected with the prosecution of the war. Staffs were seriously depleted of officers, both for active service with the forces and for special work in connection with war timber supply. Nevertheless efforts were being made in Great Britain as elsewhere to replace forests exploited for war purposes so far as staff and funds would allow.

There can be little doubt that the great increase in public interest in empire forestry which followed the World War of 1914-18 will be repeated when peace is once more obtained. Among other vital questions that will have to be tackled in Great Britain, as in some of the self-governing dominions, is the position of private forests. Even before the war this was becoming a matter for discussion, and the partial denudation of private forests, which the satisfying of war requirements must lead to, will result in a further call for state control of reforestation and of the management of these forests. (See also LUMBER.) (H. R. Bd.)

Formosa (TAIWAN), a large island in the western Pacific, between the east and south China seas, separated from the northernmost of the Philippine islands by the Bashi and Balintang channels; area 13,429 sq.mi.; capital Taihoku; population (1937) 5,609,042, of whom 299,280 are Japanese. Most of the inhabitants of Formosa are of Chinese stock and are racially akin to the inhabitants of the neighbouring Chinese coastal province of Fukien. There are some aboriginal tribesmen in the interior of the island. Formosa is the oldest Japanese colony. It was annexed after the war with China in 1894-95. The present governor-general is Admiral Seizo Kobayashi and the Japanese navy has a special interest in the island from a strategic standpoint, as there is an important naval base at Mako in the Pescadore islands off the western coast of Formosa. Penalties of fine and imprisonment have been inflicted upon the masters of foreign ships which have entered the port of Mako during storms. The supreme authority in Formosa is the governor-general, who is assisted by an advisory council, the majority of whose members are Japanese. A good deal of Japanese capital has been invested in Formosa, especially in the sugar industry; the fertile coastal plains of the island (the interior is wild and mountainous) also produce tea, pineapples, camphor and citrus fruits, and there are extensive rice plantations. Formosa's exports in 1938 amounted to 456,454,000 yen, imports to 366,659,000 yen. More than 90% of its foreign trade was with Japan. The most important Formosan exports to Japan and its colonies in 1938 were sugar (\$77,596,000 yen) and rice (126,907,000 yen). As the agricultural resources of the island have been pretty thoroughly developed there has been a tendency to concentrate on the development of hydroelectric power and of the spinning and chemical industries. Part of Formosa was under Dutch rule from 1624 until 1662 and old remains of forts and other Dutch buildings are to be found in the vicinity of Tainan, in southern Formosa.

Four-H Clubs. More than 1,400,000 rural boys and girls were enrolled in 78,600 local 4-H clubs in 1940. Of this membership, more than 600,000 were between the ages of 14 and 21. These clubs were located in practically every county in the states and territories of the U.S. They were conducted by county extension agents co-operatively employed by the state and grant (agricultural) colleges, the United States department of agriculture and the counties concerned, as a part of the program of co-operative extension work in agriculture and home economics. Assisting in the 4-H club work were volunteer local leaders, usually local farmers and homemakers, more than 104,000 of whom served the young people of their communities in this capacity in 1940. In addition, more than 43,000 older 4-H club members carried some leadership responsibilities for their

clubs. To train these volunteer leaders for their work with the 4-H clubs, extension agents and subject-matter specialists held nearly 30,000 leader-training meetings during the year. The 4-H clubs are organized usually on the community basis, but in some states they are organized according to the special interests of the members—their interests in corn, dairying, gardening, etc. Each club elects its officers from its own membership and in a number of states federates with other 4-H clubs in the county through a county council of 4-H members or county 4-H officers. A few states also have a state federation.

National 4-H club events were: the national 4-H club camp, held in Washington, D.C., June 12-19, attended by four 4-H club delegates from each of 43 states and Puerto Rico; the 4-H division of the National Dairy exposition, held Oct. 12-19 at Harrisburg, Pa., in which about 160 4-H club boys and girls representing some 40 states participated; and the National 4-H Club congress held in Chicago, Ill., Nov. 29-Dec. 6, attended by 1,600 4-H club members representing 44 states.

(M. L. W.)

France, a republic situated in the west of Europe; bordered N. by Belgium and Luxembourg, N.E. by Germany, E. by Germany and Switzerland, S.E. by Italy, S. by Spain, with the Mediterranean sea on its southeast coast, the Atlantic ocean on the west, and the English channel and the North sea to the north. Area, 212,736 sq.mi.; population (est. June 1938), 41,980,000. Chief towns (pop. 1936): Paris, 2,829,746; Marseilles, 914,000; Lyons, 571,000; Bordeaux, 258,000; Nice, 242,000; Toulouse, 213,000; Lille, 201,000; Nantes, 195,000. Language, French; religion, Roman Catholic; c. 1,000,000 Protestant.

History.—The year 1940 opened for France with the Daladier government apparently enjoying general support, but undercover hints of dissatisfaction were not lacking. Opposition centred largely in two elements: on the right, appeasers and defeatists; on the left, soviet sympathizers.

It was with this latter group that the government first dealt. The chamber passed a bill Jan. 16 excluding communists, with the exception of those who had by Oct. 26, 1939 repudiated the Communist party. This affected some 62 deputies. The one communist in the senate, Marcel Cachin, was expelled Feb. 21. Meanwhile, outside parliament leading communists in Paris were being arrested and several thousand others purged from the lists of municipal, district and departmental councillors.

Dissatisfaction with Daladier's policy was rapidly spreading beyond the ranks of communists and appeasers. On Feb. 9, the chamber, led by Blum, overrode Daladier's opposition and voted for a two-day secret session dealing with war policy. What transpired in debate is unknown, but apparently Daladier was able to satisfy his critics, for the session closed with a very large vote of confidence. Nonetheless the chamber emerged with a new sense of its importance. Attacking the government's censorship policy as "incompetent and partial," it forced Daladier on Feb. 27 to create a ministry of public information which was to co-ordinate services in the fields of information, broadcasting, propaganda and censorship.

The reports of the minister of finance, Reynaud, and the high commissioner of national economy, Serruys, reflected satisfaction in the condition of finance and industry and concern with preparing France for a long war. Reynaud could report that the interest rate had remained low and that the treasury had not expended all the money at its disposal. Serruys was chiefly concerned with avoiding a deficit in France's foreign trade balance and to this end favoured economy at home and increased production for export. Plans were being made with Great Britain to capture the former markets of Germany, Austria, Czechoslovakia and

Poland. In order to increase production, colonials were being imported to replace men mobilized in the army. And to aid economy, decrees passed Feb. 29 provided for the rationing of food and gasoline and for the prevention of price increases under the control of a national price committee.

The news of Finland's capitulation brought to a head the opposition in parliament to the government's policy of a defensive war. The senate demanded a secret session, and though the session closed March 14 with a vote of confidence, that vote was made conditional on the successful continuation of the war. A few days later came the news of the Brenner pass meeting of the axis leaders. This led to a secret session of the chamber on March 19, ending in a vote of 239 in favour of the government, with 300 abstaining.

Daladier resigned.

Within 24 hours Reynaud, the former finance minister, had formed a new cabinet, a compromise granting more posts to the Socialists at the expense of the Radical Socialists and the Republican federation of the right. The vote on the new government gave Reynaud a majority of only one vote, but he decided to carry on and attempt to win parliament's support. In contrast to Daladier's weak and unspectacular war policy, he promised an energetic waging of war in all fields, industrial, diplomatic and military.

The new government included ex-premier Daladier as minister of national defence, while Reynaud added to his former responsibilities at the finance ministry the duties of premier and foreign minister. Despite its compromise nature, Reynaud's government met strong opposition: in the senate, where Laval was building up a following; and in the chamber, where Bonnet, discarded as a one-time appeaser, was marshalling the Radical Socialists.

With the beginning of the campaign in Norway, April 9, Reynaud's position was temporarily strengthened. Both senate and chamber, impressed by the danger, offered him a free hand and large votes of confidence. News of the Norwegian fiasco, which reached France on May 2, reversed the situation, and the government survived only by bringing two members from the right wing into the cabinet—Marin of the Republican federation and Ybarnegaray of the French Social party.

Then on May 10 the great German offensive was unleashed against the western powers. In the face of mounting disaster, Reynaud himself took over the war ministry, Daladier was given the foreign ministry and only nominal control of that, Pétain was called in as vice-president of the council of ministers and chief advisor on military matters, and Mandel became minister of the interior. But this infusion of new blood was insufficient to avert catastrophe. Germany's offensive was resumed against France on June 5, and in a last effort to achieve unity Reynaud set up a cabinet on a very broad base. Daladier at last was dropped. Reynaud resumed the foreign office but devolved large responsibilities upon Paul Baudouin who became his chief lieutenant. General Charles de Gaulle was given a similar role in the war office which Reynaud also retained.

Marcel Bouthillier relieved Reynaud of his functions at the finance ministry.

These cabinet shifts could not save France. On June 10 Italy entered the war, and by the second week of June the Germans were in Paris. The government had fled, first to Tours and then to Bordeaux. Here they paused to continue the debate begun in Paris. Should France capitulate? Reynaud led the minority favouring "war to the finish," and sent a series of appeals to the United States and Great Britain for immediate aid. Roosevelt could offer nothing concrete, and Churchill, though impressed with the seriousness of the situation, could get from his cabinet only the statement, on June 13, that Britain would accept any decision

the French government might make, but that in any case it would continue the war. On June 17 the British foreign office issued a draft made the previous day by which a complete and "indissoluble union" of the French and British empires was offered. Too late. Already on June 16 the French cabinet had held a series of three meetings. Reynaud, supported by de Gaulle and Mandel, favoured continuing the war; but he was overridden by the opposition. Pétain, Weygand, Baudouin and Chautemps preferred to gamble on peace.

That evening Reynaud resigned, and a new era began for France. Pétain, the 84-year-old victor of Verdun, headed the cabinet of surrender. There was no delay. On June 17 the new premier broadcast that France was seeking peace. Via Franco in Spain, the message was conveyed to Hitler. The following day at Munich, Hitler and Mussolini discussed the fate of France. Then the call went out summoning France's envoys to Compiègne, historic site of the armistice 22 years previous. Here, on June 21 and 22, negotiations were carried on, resulting in the signature of armistice terms.

On the 24th in Rome, Italy's armistice terms were accepted, and on the 25th firing ceased.

According to the terms of the armistice, all French territory in a line from the Swiss frontier near Geneva to a point 12 miles east of Tours and thence southwest to the Spanish frontier at St. Jean-Pied-de-Port was to submit to German occupation; French naval, military and air forces were to be demobilized; all munitions of war were to be given up; in occupied areas, land and coastal defences and plans of forts were to be handed over; the French fleet was to be demobilized and disarmed under German or Italian control, except that part necessary for the protection of the colonial empire. Germany agreed to use none of the fleet for purposes other than those of coast surveillance and mine sweeping; provisions were made as to the disposal of French aerodromes, ports and navy yards. (See also EUROPEAN WAR.)

The explanation for the sudden and overwhelming collapse of French resistance has remained a matter of dispute and bitter recrimination. One fact is obvious. Militarily France was defeated by a far superior army. Striking at a vulnerable spot and moving with amazing speed, the Germans never gave the French an opportunity to organize a defence. Their army showed an overwhelming superiority in man power, mechanized equipment, aeroplanes, and, above all, the ability to co-ordinate the various arms into a bewildering and sustained attack. The French generals, building on the experience of the war of 1914-18, relied too heavily on a static defence, epitomized by the costly Maginot line. More difficult to explain was the lack of preparedness, measured not only in lack of tanks and planes, but in lack of a unified public opinion. While Germany had been feverishly preparing for war, France had been torn by internal dissensions. There was a considerable element in the French parliament which favoured appeasement even after the war had begun, and this sentiment dominated the new Bordeaux government—soon moved to Vichy. It was composed of diverse elements including Pétain, Bouthillier, Frossard, Ybarnegaray, Weygand, Laval, Marquis Chautemps and Baudouin. Not all these men were "rightists," but almost all had been identified with the policy of appeasement.

From the outset the new government was at odds with its former ally. General de Gaulle, Reynaud's coadjutor at the war office, fled to London where he established a French national committee, pledged to the energetic continuance of the war against Germany. The British supported the de Gaulle movement, while refusing to recognize the Pétain regime. The situation was further strained when the British, alarmed by the terms of the armistice

ided to take action to pre-
at the French navy falling
o German hands. On July 3
y successfully obtained the
render of a number of
rench ships which had taken
uge in British harbours,
d later, when a large unit
the French navy, stationed
Oran, Algeria, refused to
bitulate, a costly battle en-
d, ending in the destruction
several French ships and a
ge loss of life. This left the
ench with a diminished but
l powerful fleet stationed at
ulon. However justifiable
m the British point of view,
episode embittered the feel-
s of many Frenchmen and
engthened the pro-German
nings of the Pétain govern-
nt. On July 5 the latter de-
ed to break off relations with
tain.

The new regime was faced
h problems almost insur-
mountable under the most fa-
vorable conditions. Though it
l, in theory, administrative
ontrol over all of France, in
actice the German govern-
nt completely controlled
o-thirds of the country, in-
ding all the Atlantic coast;
ris, the administrative and
nomic heart of France;
st of the industrial and min-
areas; and nearly all the
in-producing areas. Some
000,000 refugees had to be
atriated, the portion of the
ay not held as prisoners by
 Germans demobilized, and
German army of occupation
ported at a set cost of 400,-
2,000 francs a day. In a

untry ravaged by war and bewildered by defeat these drastic
blems had to be solved by a government held in suspicion
many Frenchmen and forced to co-operate with the victors.
Pétain's first step was to provide a new constitution which
uld give more power to the chief executive. This was author-
ed by the chamber and senate July 9, and ratified by the na-
anal assembly July 10, on the basis of a draft drawn by Laval
d a committee. On July 12 Pétain proclaimed the new organic
y by which he succeeded Lebrun as head of the French state,
nbing the offices of president and premier. He was given full
islative powers until such time as a new parliament should be
ganized and, thereafter, legislative decree powers in times of
ergency, of which occasions he was to be judge. He also re-
ved complete treaty-making power, military and appointive
wer. The executive was supplemented by a government of 12
nisters. Parliament was to be merely a consultative body.
The new France repudiated completely the third republic's

ADOLF HITLER looked down pensively on Napoleon's crypt in Les Invalides, Paris, June 24, 1940, ten days after the fall of the French capital

basic principles of parliamentary government and individual free-
dom. For the "false idea of the natural equality of men," Pétain
promised to substitute "a society based on a hierarchy of ability
and service to the state." For the French revolution's slogan of
"liberté, égalité, fraternité," he substituted "travail, famille,
patrie." It appeared that France would enter the new European
order as another "totalitarian" state.

One step in this repudiation of the past was the decree of July
29 setting up a court of seven judges to try the cases of those
held responsible for France's defeat. The court met at Riom,
Aug. 8, and was given a list of the accused, composed of: Dala-
dier, Reynaud, Blum, Delbos, Campinchi, Mandel, Cot and
Gamelin. A military court had already condemned de Gaulle to
death on Aug. 2. Although receiving considerable publicity, the
Riom court had rendered no formal judgments by the end of
1940.

The doctrines of right-wing French nationalists found expression in many acts of the new government. A semimilitary youth movement was organized, and sports and "national" history were given a larger role in education. A beginning was made in the repeal of anti-clerical legislation (dating from before the war of 1914-18), and measures were passed to strengthen family life and increase the birth rate. Action was taken against liberals, aliens, Jews and all supporters of "international ideas," beginning with a purging of the press in July. Jews were discriminated against, though they received much better treatment in unoccupied France than in areas under German control.

The first steps toward building a corporate organization of industry and labour were taken, with the state assuming extensive control over various aspects of economic life, including the fixing of prices and wages. As part of the program of collaboration with industrial Germany, agriculture was encouraged at the expense of industry. The serious financial situation of the government hindered public works projects aimed to relieve the serious problem of unemployment. All gold securities and foreign exchange in the occupied area were seized by the reich, June 22, and the Bank of France put under the control of a German official. The franc was pegged at 20 to the mark, but the reopened banks were able to function only within a limited sphere.

It was impossible to get any adequate picture of living conditions in France. Food rationing began in August and became steadily more stringent in succeeding months. Gasoline nearly disappeared and private cars were banned Aug. 2. As early as November coal was being rationed by the pound in Paris. If France was not actually starving, some areas were certainly suffering from undernourishment and lack of heat.

Within the government the trend was steadily toward more control over local government, accompanied by a purge of all liberal elements. The cabinet was reshuffled Sept. 6, giving only 8 of the 12 members ministerial rank and leaving Laval the only member with parliamentary experience. Next to Pétain, Laval was the most powerful man in the government. On July 12 Pétain designated him as his successor. It was Laval who conducted the negotiations with the German government, working chiefly for a return of the government to Paris, the breaking down of the stringent barrier between occupied and unoccupied France, and the freeing of the French prisoners of war. On none of these points did he have much success.

Next to reaching a *modus vivendi* with Germany, the chief problem of French foreign policy was to retain the French colonial empire. Large concessions to Japan in Indo-China were made perforce, and at the end of the year a border war was being carried on there with Thailand. Of greater consequence was the de Gaulist movement. To check this movement Pétain on Sept. 7 sent General Weygand to take control of the African colonies and organize their defence. (See FRENCH COLONIAL EMPIRE.)

In the negotiations with the German government Laval consistently favoured close collaboration, but Pétain began to exhibit an increasing resistance to any large-scale concessions. After conversations with General Franco, Oct. 23, Hitler met Pétain the following day. Just what he demanded is not known, but possibly he asked for the right to send troops across France and the right to establish air bases in French colonies. At any rate it appears that Pétain offered little except further economic collaboration, though Laval continued the negotiations.

That collaboration was not working smoothly was evident when Pétain on Nov. 14 publicly protested the wholesale evacuation of the French from Lorraine. This action was only a continuation of a thorough policy of nazification which had been going on in Alsace and Lorraine since early August. By Dec. 3, Pétain

announced that some 70,000 of these refugees were being cared for by the French government.

During November there were recurrent rumours of opposition to Laval developing in the Pétain cabinet. Likewise General Weygand, commander of the army in Africa, although firmly loyal to Pétain, was reported to be opposed to Laval. This appeared definitely to be the sentiment of a large part of the French people. To all outward appearances, however, Laval's position remained unshaken, and the news of what the German papers called "the putsch of Vichy" came as a surprise to everyone.

The press carried the story Dec. 14 that at a cabinet meeting the evening before Laval had been stripped of all his offices and placed in "protective custody." Various explanations for his fall were advanced. Some held the theory that he planned a *coup d'état* for Dec. 15, the occasion of the removal to Paris of the ashes of Napoleon's son, the Duke of Reichstadt, and the rumours of this plot led to a showdown in the cabinet. Although Flandin, considered favourable to collaboration with Germany, was appointed foreign minister to replace Laval, the German government regarded the dismissal as a direct affront. Laval's freedom was demanded and secured, but at the end of 1940 he had not been reinstated; nor had any general agreement been reached by the two governments.

Certain factors may explain the stronger stand taken by Pétain toward the end of the year. His personal popularity was so great that the nazis, had they ousted him, would have found it difficult to replace him with anyone enjoying to a like degree the respect of the French people.

Moreover, there was always the possibility that under pressure Pétain might take the fleet to North Africa and with Weygand's army reopen the war. The growing strength of British power made this possibility seem less unlikely than it had appeared in June. These are only speculations. Whatever the future had in offer, the year that closed on a note of such uncertainty had been one of suffering and tragedy unparalleled in French history.

(D. C. McK.)

Franco, Francisco (1892-), Spanish soldier and head of the Spanish government, was born in Galicia. After military service in Morocco, he became a colonel in 1926, and served under the Spanish republic of 1931 in the Balearic islands, being later transferred to Morocco again. In 1935, he was made chief of staff. On the outbreak of the civil war in June 1936, he flew to Tetuan, in Spanish Morocco, where he organized the transport of Foreign Legionaries and Moroccan troops to the Spanish mainland, whither he soon followed. Upon the death of Gen. Sanjurjo, Gen. Franco became military leader of the insurgents. After his victorious conclusion of the civil war in 1939 he added the title of prime minister to the others he possessed, organized his cabinet, and began the task of reconstruction.

Franco issued a declaration of "strictest neutrality" at the outset of the European war in Sept. 1939, but the possibility of Spain's entry into the conflict after the French defeat was the cause for much speculation during the last half of 1940. His conference with Hitler on the French-Spanish border Oct. 23 and the visits of Serrano Suñer to Berlin and Rome seemed to indicate that he was about to give the axis full military aid. Later, however, he reached an understanding with the British, who on Dec. 2 released frozen Spanish credits amounting to several hundred thousand pounds. There were reports also at this time that Hitler had secretly promised Franco to return Gibraltar after the war, in return for his non-belligerency.

According to dispatches from Washington on Dec. 7, Franco had assured the United States of his intentions to remain neutral.

and had requested a credit of \$100,000,000 for food.

Frank, Glenn (1887-1940), U.S. educator and publicist, was born in Queen City, Mo., Oct. 1, was graduated from Northwestern university in 1912 and served as assistant president of the university from 1912 to 1916. For the next three years he was engaged in business research. In 1919 he became a member of the editorial staff of *Century Magazine*, of which he was made editor-in-chief in 1921. He held this post until 1925, when he was elected president of the University of Wisconsin, where he had a stormy career which ended in 1937 with his removal by the regents despite widespread protests. In December of that year he was chosen chairman of a committee of specialists to draft a program for the Republican National committee. He sought the Republican nomination for United States senator from Wisconsin in 1940, but was killed in an automobile accident near Greenleaf, Wis., on Sept. 15, two days before the primary election.

French Colonial Empire. Total area (approx.) 4,657,000 sq.mi.; total pop. (est. Dec. 31, 1937) 70,147,000. Certain essential statistics of the French colonies, protectorates and mandates are given in the table on page 308.

History.—The outstanding event of the year 1940 was the signing of the armistice between France and Germany on June 22 and between France and Italy on June 24. The effects of this on the French colonial empire were: (1) the demilitarization of the important ports of Algeria, Tunis, Morocco, French Somaliland and Syria; (2) the assumption by the armistice commission at Wiesbaden of general control of colonial policy, particularly in the far east, where it acquiesced in the Japanese invasion of French Indo-China; and (3) the creation of a schism between the colonies which accepted the armistice signed by the Pétain government and those which declared themselves ready to resist and proclaimed their wish to identify themselves with the cause of Free France represented by General de Gaulle.

In the closing months of 1940, the French colonies adhering to Free France, with the dates of their adherence, were: New Hebrides, July 20; Tahiti, Sept. 2; New Caledonia, Sept. 20; the Chad Territory, Aug. 26; the mandated territory of the Cameroons, Aug. 28; French Equatorial Africa, Aug. 28; French establishments in India, Sept. 9.

The remaining territories of the French colonial empire had officially acknowledged their allegiance to the French state, represented by the government of Marshal Pétain.

Effective adherence to Free France was expressed either spontaneously or, in the case of colonies which possessed a representative council, either by a vote of that body or by a plebiscite. Plebiscites were held in the New Hebrides, Tahiti and New Caledonia. The entire population of Port Vila in the New Hebrides, about 400 men and women, met under the presidency of the vicar apostolic, Monseigneur Halbert. The assembly signified its vote either rising to its feet or remaining seated. Only four persons remained seated. The same method was adopted in Santo, the other principal town of the New Hebrides. In the islands of Tahiti, Morea and Paumotu 3,564 votes were given in favour of General de Gaulle against 18 for the Vichy government. The governor was deposed and the administration of the island taken over by a provisional committee composed of three members of

MAJ. GEN. NISHIHARA of Japan conducting negotiations with French officials for concessions in French Indo-China. Despite a signed agreement the Japanese invaded the colony Sept. 22, 1940

the privy council, subsequently confirmed in office by General de Gaulle who also appointed a governor in accordance with the wishes of the inhabitants and of the commissioner of the Pacific. In New Caledonia the general council voted an address to General de Gaulle on June 24; and the celebration of July 14 was the occasion for public demonstrations in the same spirit.

The French establishments in India decided to continue the struggle by the side of the Allies, on the basis of the treaty of 1814. On being informed by the governor, M. Bonvin, of his adherence to General de Gaulle, the viceroy of India at Simla confirmed him in his office. In the Chad Territory the governor, M. Eboué, and the military commandant, Colonel Marchand, published at Ft. Lamy on Aug. 26 a proclamation of loyalty to Free France.

Two days later the example of Chad was followed by the remainder of French Equatorial Africa and by the mandated territory of the Cameroons.

(See also EUROPEAN WAR.)

Economic Collaboration.—The conditions laid down for economic collaboration were as follows: Free France had clearly signified its decision to maintain the standing of the franc which, according to an agreement entered into with the British treasury, was to be linked up with sterling at a fixed parity exchange of 176½ to the pound. Apart from the general agreement of Aug. 7, the basic document of collaboration between Great Britain and Free France, in respect of the colonies, was the letter written on Aug. 27 to General de Gaulle by the British prime minister, and published in the press, to the effect that the British government would do everything in its power to maintain the economic stability of all French overseas territories, provided they stood by the alliance; that it was ready to foster trade and help the administration of those parts of the French empire cut off from France, so long as the British way to victory was not impeded; and that to those colonies adhering to General de Gaulle it would extend economic assistance on a scale similar to that which would apply in comparable circumstances to British colonies.

The first proof of economic rehabilitation, apart from particular economic agreements, was in fact the raising of the blockade and the consequent enabling of the colonies to export and import, especially to and from Great Britain, the dominions and the

United States of America.

Colonies Not Adhering to Free France.—The French colonies which had not adhered to Free France were all, in general, subject to the blockade and their internal economic situation was in consequence most precarious. Sporadic upheavals, more or less public, had made themselves evident in a great number of them. In the French West Indies, a special agreement was made in Aug. 1940 between the local authorities and the government of the United States, owing to the presence in the islands of several units of the French fleet. By this agreement, on the one hand the French warships were immobilized in their then harbours, and on the other hand the islands were allowed to continue their commercial relations. In French Indo-China an agreement signed with Japan on Sept. 22 put an end to long negotiations and gave the Japanese the right to occupy naval bases and to the passage of

their troops. The latter concession, however, was not effected without resistance on the part of the French troops, who gave combat under conditions of which the details were not published, and lost several hundred men near Lang-Son, 60 mi. N. of Hanoi. (P. O. L.)

French Colonies in America.—In 1940 many conflicting rumours concerning conditions emanated from Martinique and other islands. Defences of the island were reported strengthened. On the other hand, in September, a plebiscite on the question of continued support of the Vichy government was rumoured in the offing. U.S.-made aeroplanes on the aircraft carrier "Bearn," according to some accounts, had been exposed to the elements and were no longer in condition, but this was vigorously denied. During November, several United States naval units cruised in the vicinity of the island and, in early December, Pres. Roosevelt on a tour of inspection of Caribbean defences, stopped outside the territorial waters and conferred with the U.S. consul and the naval observer. At Washington, some days later, the French ambassador refused to comment on reports that the U.S.A. was negotiating with a view to acquire naval base rights. Effects of the French collapse were likewise felt in other colonies. Guadeloupe, whose exports formerly went almost exclusively to France, was estimated to have suffered a loss of 99% of its external trade. St. Pierre and Miquelon, already in the vortex of economic depression for nearly a decade, were subjected to a Canadian semi-blockade similar to Martinique's. In French Guiana the great problem was that of the convicts in the penal colony.

Communication.—Under normal conditions Guadeloupe, French Guiana and Martinique have good external communication by air and by sea. Guadeloupe and Martinique have adequate highway systems. In French Guiana, however, except on the coast, where there are 250 km. of highway and 12 km. of railway, and in Inini, transport services are primitive, although there are good interior waterways.

Trade and Resources.—St. Pierre and Miquelon depend entirely on fishing. Total exports in 1939 were valued at 18,010,000 francs, imports at 28,375,000 francs.

Guadeloupe and Martinique are essentially agricultural. About 60,000 hectares, a third of the entire area of Guadeloupe, is under production. Guadeloupe produces principally sugar, bananas, coffee and cacao. In 1937, 58,881 tons of sugar and 45,733 tons of bananas were exported. Sugar refining and rum production are important. There are 18 sugar mills and 94 rum distilleries. In 1938 imports were valued at \$8,465,000; exports \$11,851,000. Foodstuffs, textiles, beverages and lumber are the chief imports. Sugar is the leading export of Martinique; rum is second. Bananas are important, with some 1,500 hectares under cultivation. Pineapples are grown for canning (43,000 cases produced in 1937). In 1938 these four commodities accounted for 98.8% of all exports. Exports of \$8,858,000 went almost entirely to France (99.1%); imports were \$6,756,000 in value (France, 65.9%; United States, 17.3%; Belgium, 6.8%). In 1940 Martinique produced 55,000 tons of sugar, Guadeloupe 61,000 tons. Estimates for 1941 were 65,000 and 61,000 tons, respectively.

French Guiana is the least developed European colony in America. Its principal products are gold, tulipwood and other cabinet woods, sugar, bananas, rice, corn and manioc. Two-thirds of the imports formerly were supplied by France, most of the remainder by French colonies and the United States. Over 95% of exports went to France. In 1938 imports approximated 54,000,000 francs; exports 46,000,000 francs. The monetary unit is the French franc.

French Literature. French literature during 1940 was under the sign of Mars. It was a difficult year which mirrored the psychic and politico-military preoccupations of the nation. It was a period of apocalyptic introspections and historic changes in which the purely creative forces had hardly any opportunity to emerge.

Most of the younger writers were mobilized and at the front. The older generation of novelists, critics and poets limited their production to matters concerning the national defence. Jean Giraudoux, the novelist and playwright, became minister of information at the outbreak of the war, and was active in that capacity until shortly before the armistice. Paul Valéry, André Maurois, Jules Romains, Louis Gillet, Georges Duhamel and others took part in propaganda activity through radio and newspaper work. Paul Morand was in London in an important diplomatic post. Publishing was reduced to a minimum, yet it went on in spite of censorship and a growing dearth of paper stock.

The frontier-war of patrol manoeuvres along the Maginot line, which marked the first chapter of the war, brought forth a number of books of a semi-military or lyrically confessional type. The shock of the invasion threw all creative and critical efforts into confusion, and the voice of literary France was practically silenced. The complete disorganization of every branch of publishing activity increased the impression of stunned chaos after the armistice. The national revolution, led by Marshal Pétain, which followed the annulment of the Third Republic by the general assembly of July 10, 1940, encouraged the beginnings of a strongly marked traditionalist literature, the basic impulse of which was an emphasis on the peasant direction given earlier by the soldier-poet, Charles Péguy.

In the early months of the war, the mystic revolution which had been going on for several years was still in full swing. It had manifested itself in a spiritual revival associated with the names of Patrice de la Tour du Pin, Pierre-Jean Jouve, Paul Claudel, Jean Le Louet, in poetry; with the names of Georges Bernanos, François Mauriac, Jacques Maritain, Marcel de Coste, Louis Fumet, in prose. Patrice de la Tour du Pin, who was definitely the leader of the revolution in mystic poetry, was wounded in Oct. 1939 and taken prisoner on the Sarre front. Jean Le Louet was in Warsaw during the war. The group gathered around *Esprit* by Emmanuel Mounier continued efforts to create a personalist movement in a Christian, communal tradition. *Yggdrasill* continued to accentuate a metaphysical aspect of poetry, developed its anti-surrealist direction, and published poems written at the time.

The romantic renaissance was flourishing during the Maginot stalemate. The neo-romantic movement calling itself College for Sacred Sociology, created by Georges Bataille, Roger Caillois, Georges Duthuit, Michel Leiris, was still active in maintaining the primacy of the Dionysian myth. In attempting to revive the ritualistic gesture and ecstasy, particularly in line with Nietzschean doctrines. *Acéphale* was their medium. Albert Camus's *Le Romantisme et le Rêve* had become the *livre de chevet* of the younger groups. The surrealist revolt, under André Breton, continued its fantastic explorations, but it was going towards its decline, and the mobilization of almost all its members simply affirmed concretely the already existing dispersion of its forces. The *Cahiers du Sud* gathered all these scattered energies, emphasizing the reconstruction of a romantic myth.

The legal suppression of the extremist communist movement reduced the effects of this tendency to literary impotence. Their leader, Louis Aragon, whose newspaper *Ce Soir* was suspended by the government in Sept. 1939, fled the colours, and was said to have been among those decorated after the battle of Dunkirk. In the spring of 1940 he published *Les Voyages de l'Impériale*, a novel set in the Paris of 1900. Jean Giono, author of numerous peasant novels, did not abandon his anarchic pacifism when war broke out. He published *Refus d'Obéissance* and was incarcerated by the military authorities.

The first literary documents of the war began to appear in the early spring of 1940. André Chamson, whose leftist novels had a success before the hostilities, published *Quatre Mois*, *Carnet d'un Officier de Liaison*, a personal diary of experiences and reflections by a sensitive writer trying to record the human, all-too-human side of the border conflict. Armand Tjebbe, one of the most brilliant among the younger French authors, had nurtured himself on the new nationalism which developed after the internationalism of the so-called postwar years, fought heroically on the Sarre front where he was wounded. His *Journal de Guerre* is a document of high humanity and patriotism. Louis Aragon, Paul Eluard, André

de Richaud used their leisure from military routine to indite poems that had a simple style reminiscent of folklore moods. The principal creative effort was to be found in the little reviews which began to pullulate in the tense spring and which were published by the soldiers themselves at the front. The review *P.C. 1940 (Poètes Casqués)*, *Cahiers de Poésie publiés par des Poètes Soldats*, opened its first issue with a tribute to Alan Seeger, the American soldier-poet of the World War of 1914-18, and published texts by Alain Borne, Bernard Privat, Pierre Seghers, André Blanchard, Paul Gilson. There were other soldier-magazines: *Le Clairon de Strasbourg*, *Le Vitaliste*, *Casemate*.

Behind the lines a diminished literary activity went on. None of the better known writers launched any new books. Francis Carco's *Bohème d'Artistes*, Raymond Queneau's *Un Rude Hiver*, Maxence van der Meersch's *Pêcheurs d'Hommes*, Jean-Paul Benec's *Amour de la Chasse*, René Béhaine's *Le Jour de Gloire*, Jean Marteau's *La Mainmorte*, Olivier Séchan's *Le Bouquet d'Orties*, Louis Danielou's *Belle Marine* were among the more interesting novels that saw the light of day during the period of waiting. Marcel Jouhandeau appeared with *Requiem et Lux*, and Jean Cocteau with *Les Monstres Sacrés*. Reviews like the *Mercure de France*, *La Nouvelle Revue Française*, *Revue des Deux Mondes* and similar established magazines kept the public informed about the literary activities and tried to balance their critical judgments against the censorship interdictions.

The armistice of June 24, 1940 put a temporary end to the publishing activities of the country. The tracing of an artificial frontier between the occupied and non-occupied zones created unsurmountable mechanical barriers. Many projected publications of books and reviews were automatically abandoned. Many books and issues of magazines ready for distribution could not be moved. The great publishing houses in Paris and in the provinces were disorganized, and even the question of sufficient textbooks for the schools became very serious. The flight of the refugee writers southward paralyzed every effort at reconstruction.

The *Revue des Deux Mondes* and *L'Illustration* remained the only publications that continued with effective results. The former moved to Clermont-Ferrand and became the official organ of the new nationalist regime. Marshal Pétain used it to disseminate his first basic addresses to the nation. His speech on the new national education appeared there on Aug. 15, 1940. Traditionalist writers of the old schools found a haven in the pages of the review, notably: Henry Bordeaux, André Chaumeix, Pierre Bernus, André Demaison, Victor Giraud, Henri Pourrat, Maurice Coste and Robert d'Harcourt.

Under the impulse of the nationalist revolution a reorientation began slowly to take place. The regime itself, having announced its reactionary policy under the slogan of "Fatherland, Work and Family," accentuated the importance of the peasant's position in the body politic. The notion of the "return to the earth," and a determined revolt against the big city, overshadowed all other preoccupations.

A new and significant development in French literature can be noted in the fact that French books were in 1940 being published on foreign soil. Exiled writers like André Maurois, Jules Romains, André Simone, Denis de Rougemont, Ivan Goll and others published their books in French in New York. A French publishing house was founded in Canada. Jules Romains presented his *Sept Mystères du Destin de l'Europe* in the collection *Voix de France* (New York) in which he recounted his experiences during his year-long efforts towards the maintenance of peace in Europe, and in which he analyzed the enigmatic forces that made that dream impossible. André Maurois, whose *Tragédie en France* also appeared in the collection *Voix de France*, gave a graphic reportage of his experiences as liaison officer during the invasion of France. Ivan Goll published a further instalment of his long-range poem *Jean Sans Terre*. (E. Js.)

Friedrich Karl (1868-1940), landgrave of Hesse, Germany, was born in Holstein, May 1, the son of Landgrave Friedrich Wilhelm. He served in the World War of 1914-18 as a lieutenant general of German infantry. In 1918 he was elected king of Finland but because of the objection of the Entente powers he refused the throne.

He succeeded to the title of landgrave on March 25, 1925, after it had been renounced by his elder brother. He married Margaret of Prussia, a sister of former Kaiser Wilhelm, on Jan. 25, 1893. He died in Cassel, Germany, May 29.

Friends, Religious Society of. The Religious Society of Friends had in 1940 a membership of approximately 160,000, which comprised 54 yearly meetings and annual conference groups. The society was in 1940 represented in 30 countries throughout the world. The membership of Friends in America was 110,000. In the United States

and Canada there were 27 yearly meetings in 1940. Six of these meetings composed the Friends General conference, which held its biennial meeting at Cape May, N. J., July 8-15, 1940. Ten of the yearly meetings belonged in an association which meets quinquennially and is known as the five-years' meeting. The last session was held at Richmond, Ind., on Oct. 16-23, 1940.

Since the Friends World conference held at Swarthmore and Haverford colleges, Pennsylvania, in 1937, Friends throughout the world have been co-operating through the Friends World Committee for Consultation, with headquarters in London and in Philadelphia. Friends centres are maintained in several cities of international importance by co-operation between the English and American service committees, and the Friends in the particular country. These centres are in Berlin, Vienna, Geneva, Copenhagen, Amsterdam, Paris, Rome, Tokyo and Shanghai. All of these centres operated continuously during 1940. Their function included assistance to refugees, local relief when needed, promoting fellowship among Friends and serving as a centre of international understanding and good will. As a development of their schools and missionary work, Friends also have local centres in Palestine and Syria, India, East Africa, Pemba, Madagascar, Cuba, Jamaica, Mexico and Alaska.

The American Friends service committee conducts the chief program of social action for the society in the United States. The main activities are directed by the social-industrial, peace, foreign service, and fellowship council sections of the committee.

The social-industrial section conducts work camps in areas of social conflict, where university students volunteer for nine weeks during the summer to work on creatively constructive projects for the community, such as building playgrounds, or swimming pools; or building better homes; or work in the national forests. Meanwhile they study the social problem of the community. In 1940, 258 young people participated in this exploration of good will as an alternative to the use of violence in dealing with social problems.

National volunteer service was organized during the fall of 1940 to meet the need of young men who wanted to give a year of volunteer service of national importance, equivalent to the year of military service prescribed by the government. The work camp at Cooperstown, N.Y., was extended to an all-year term to serve this purpose. In the autumn the service committee organized civilian public service to provide opportunity for pacifists to perform work of national importance under civilian direction, such as may be assigned to conscientious objectors under the National Selective Service act.

The peace section conducted during the summer ten institutes of international relations, and through the student peace service sponsored 117 young people who directed peace education in 21 rural communities. Eighteen young people went to Mexico during the summer and assisted Mexican peasants erect two school-houses. Attention is given to the problems faced by the conscientious objectors.

The foreign service section co-operated with English Friends through the Friends service council in maintaining the Quaker centres of service and good will mentioned above. Through the committee's refugee service three hostels have been established. One is at Havana, Cuba, one at the former Scattergood school at West Branch, Ia., and one at Richmond, Ind., known as Quaker Hill. In addition to these permanent hostels the refugee committee has directed summer hostels, seminars, and language camps for refugees. It has opened a teachers' work shop at Haverford, Pa.

Relief to the hungry victims of war was in 1940 the chief concern of the committee in its work abroad. Just before Europe broke into open war, feeding of 500,000 Spanish children daily

was carried on by the committee workers in Spain. Since that time the chief need has shifted to the section of France occupied by the Germans. At the close of the year there were representatives of the committee in France with field offices at Toulouse, Montauban, Perpignan, Auch and Marseilles. In that area more than 7,000,000 refugees from Belgium, Holland and the northern departments of France in addition to Spanish refugees have sought refuge.

The fellowship council seeks to interpret the spiritual message of the Society of Friends. It corresponds with members of wider Quaker fellowship who are attracted to the Society of Friends by its peace testimony, its social action, its concern for the sacredness of personality and the freedom of conscience.

Friends maintain private schools in England, Australia, New Zealand, Ireland, Holland, India, China, Japan, Africa, the United States, Palestine and Madagascar. In 1940 there were 56 of these schools, enrolling 38,200 pupils.

Four Friends bodies acted during the year on the invitation to join the World Council of Churches. The five-years' meeting of the Philadelphia yearly meeting held at Arch street accepted the invitation, with a reservation that the statement of basis be held to be a creed. Friends General conference accepted, providing the basis be extended to include other than creedal churches. The London yearly meeting found it impossible to accept the invitation lest their objection to a creed be misunderstood.

(L. D. SH)

Frohman, Daniel (1851-1940), American theatrical manager, was born in Sandusky, Ohio, Aug. 18, 1851. At one time or another he managed the Fifth Avenue theatre, Madison Square theatre, Daly's theatre and the Lyceum theatre, all in New York city. He made E. H. Sothern a star, and among others who appeared under his management were Mary Anderson, Fanny Davenport, Salvini, William Gillette, Robert Mantell and Maude Adams. He died in New York city, Dec. 26, 1940.

Fuel: see COAL INDUSTRY; GASOLINE; NATURAL GAS; PETROLEUM.

Fuel Briquettes. The compression of finely divided or low grade coal into briquettes, to make it more adaptable as a fuel, has grown to an industry of considerable magnitude in a number of countries, especially those having large supplies of low grade coals. Some of the leading outputs in 1939 were as follows: United States 936,400 metric tons; Belgium 1,712,000 tons; Czechoslovakia 724,000 tons; France 7,475,000 tons; Germany 51,000,000 tons; Netherlands 1,323,000 tons. Total world production is estimated at 64,834,000 tons. In 1939 of the leading European producing countries briquettes have an important place in export fuel trade; both France and Germany have net exports in excess of a million tons, while Belgium stands at about half that figure; Czechoslovakia had a small export plus, but in Netherlands imports exceed exports. Imports in the United States are negligibly small, and exports are only slightly greater, chiefly to Canada. Although little of the United States output is exported, domestic consumption is widely distributed, shipments having been made in 1939 to 38 States, Alaska, the District of Columbia. Included in the briquette output reported above, there was produced in 1939 in the United States 215,500 short tons of briquettes wrapped in paper for convenience and cleanliness in handling, the product being commercially known as "packaged fuel."

(G. A. RO)

Furniture Industry. The approximately 2,250 factories in the United States manufacturing wooden and metal furniture completed 1940 with a dollar volume gain of 15%, bringing total production to \$465,000,000, or approximately back to the 1937 level but still 28% behind the 1929 volume of \$659,000,000. The chief cause of this gain has been small home building, although army cantonment requirements also contributed something to this improvement.

The furniture industry is well distributed geographically, with its principal manufacturers centred in New York state, Illinois, North Carolina, Indiana, Pennsylvania, Michigan, Virginia, Ohio, California, Massachusetts, Wisconsin and Oregon.

Despite the steady growth in popularity of metal furniture since 1930, wood remains the dominant raw material in about 85% of the output. Glass and synthetics are beginning to be utilized more generously, but such furniture is a negligible quantity, not exceeding 2%.

The principal woods used in 1940 as shown by a survey of the Furniture Mart, Chicago, the world's largest exclusive home furnishings marketing centre, were in the following order: mahogany, walnut, maple, oak, oriental wood, Philippine woods, aspen, tinwood, miscellaneous woods and imitations.

The furniture industry spent one-third of its income for materials, as follows: lumber, \$75,000,000; finishing materials, \$15,000,000; steel, \$25,000,000; fabrics, \$25,000,000; other supplies, \$10,000,000. Labour received about 30% or \$125,000,000 as its share, while selling, administration and taxes ate up another third, leaving manufacturers a slim net profit not to exceed 3% and in many cases less.

In 1929 there were 3,500 furniture factories in the United States. The mortality was heaviest from 1932 to 1934, one-third having been liquidated. Since 1935 there has been a slow increase to 2,250 factories, most of them small producers of upholstered furniture and casegoods.

Europe.—During 1940 the furniture industry in Europe was demoralized by the war. France's 500 factories, mostly small, ceased or turned to war orders. England's 1,500 small and large factories lost most of their export trade and tried to aid national defence to survive. Germany's 1,000 furniture factories were making only enough for home consumption and existing precariously with foreign supplies and trade cut off. Canada's 100 furniture factories, on the other hand, were having their greatest boom in 20 years with volume up nearly 50%. (J. A. G.)

Furs. The year 1940, compared with 1939, brought an increase in business of over 35% in dollar sales volume to the U.S. fur industry and around 45% in the number of garments sold. Skin prices were generally low during the first half of the year. The turning point came following the successful withdrawal of the British army from Dunkirk, France. The industry experienced an active spring business, stimulated by the low retail prices and a vogue for jackets and scarfs.

The public began to buy coats freely in August. This movement gained during the late fall and reached a peak in November. Retail distribution and wholesale manufacturers felt the benefit of increased consumer buying power, following widespread industrial activity during the last quarter of the year. National defence and British armament expenditures brought ready work to the people in many towns and cities. More women than for many years past invested in fur apparel. The prevailing retail price range on a variety of furs was from \$100 to \$300. An abundance of fur skins from Canada, U.S.S.R., Afghanistan, China, Australia, Southwest Africa, India, South America and Europe added to the U.S. supply and kept skin prices at reasonable levels in spite of an increased consumer de-

mand. Quantities of skins were evacuated from Europe and sent to New York before the Mediterranean seaports were blockaded. Much foreign fur capital fled from Europe to America. United States imports of all kinds of furs for the 12-months period Dec. 1939 to Nov. 1940 totalled over \$75,626,000 compared with \$52,402,925 for the corresponding period in 1938-39. Most of this was due to heavy imports of Persian lamb (\$24,954,040) from Southwest Africa, U.S.S.R. and Afghanistan. These were formerly marketed in London, Leningrad, Leipzig and Paris.

United States exports totalled in value \$11,732,598 for the 1939-40 12-months period compared with \$11,957,346 in 1938-39. The number of skins shipped was 12,000,000 odd, the same number as in 1938-39. Some of these skins were shipped back to the United States from Europe when the Germans invaded France, and started bombing London.

The prospect of Canadian and Scandinavian silver fox breeders dumping their 1939 production of some 700,000 fox pelts in the United States, since the European markets were closed by the war, induced the U.S. government to establish a quota of 100,000 skins for 12 months on imports of silver fox from all foreign sources. This action saved the American fox breeders from ruin, which faced them in December of 1939. It stabilized silver fox prices, although the article hit a new low price level and only showed recovery during the last half of the year.

Canada shipped into the U.S. 58,300 silver fox skins and Norway over 35,000. The quota continued during 1941 with Canada's share increased to 70,000 skins.

There was an influx of new capital into the industry in 1940, which was accounted for by the opening of several thousand new firms, merchants, dealers, manufacturers and retail outlets. The industry was free from serious labour trouble. Workers enjoyed longer periods of employment than any year since 1928. Financing was facilitated by additional association and factoring resources. Credit was kept under efficient control, but was generally considered to be cheap. The U.S. fur industry consumed about twice as many foreign fur skins as it did domestic fur skins. There was an increase in the amount of fur dressing and dyeing of about 20% over 1939.

For the time, the New York fur market became the fur centre of the world and the only free fur market in existence. Others were either closed or under strict government control. For the first time the Norwegian platina fox was introduced to the U.S. trade in considerable quantities (1,000 skins). This so-called platinum fox is a new type and at a public auction in New York one skin brought \$10,000 which was the highest price ever paid in the history of the fur trade for a single fur skin.

During 1940 there were 169 insolvencies in the U.S. fur trade, representing liabilities of \$3,760,155. This was a slight increase over 1939. Of the insolvencies 104 were in New York city and 65 were outside of the metropolitan area. From a financial and industrial point of view the U.S. fur trade ended the year 1940 with a turnover of merchandise approximating that of 1929 and representing about \$175,000,000 in wholesale value and approximately \$300,000,000 in retail value. (W. J. Br.)

Gambia: see BRITISH WEST AFRICA.

Gamelin, Maurice Gustave (1872-), French soldier.

Son of a general, he was born in Paris and educated at St. Cyr. He was chief of staff of Gen. Joffre in 1914 and played an important part at the battle of the Marne; it was he who was reputedly most insistent in his prophecies that Germany would invade France by way of Belgium. He was promoted general of brigade and in 1917 became commander of a division. After the war he was head of a military mission to Brazil until 1925, when he was appointed commander of French forces in the Levant. He became chief of the general staff in 1931, inspector general in 1935 and supreme commander of all armed forces June 6, 1939. His tactics after the start of war in Sept. 1939 were built largely around defence, and consequently Germany's mechanized war of movement in May and June 1940 found France woefully unequipped to stem the invasion.

On May 19 he was replaced as commander in chief by Gen. Maxime Weygand (*q.v.*). Gamelin was placed in "administrative internment" Sept. 7 at the Château de Chazeron near Vichy, where he passed the time writing his memoirs. On Nov. 17 he was formally arrested and taken to a detention centre near Riom to await the war-guilt trial.

Gandhi, Mohandas Karamchand (1869-), Hindu nationalist leader, was born at Porbandar (Kathiawar), India. For his biography, see *Encyclopædia Britannica*, vol. 10, p. 15. At Madras on Jan. 22, 1937 Gandhi announced his retirement from active Indian politics, but by 1940 he was as prominent as ever in Indian affairs of state. The All-India congress on March 20 delegated to him the

direction of negotiations with Great Britain for national independence. On April 27 he disavowed any intention of embarrassing Britain during the war by conducting another campaign of civil disobedience. After the defeat of France he suggested nonviolence to combat Hitler and on July 2 he urged Britain to seek peace with Germany.

Gandhi reiterated his stand for complete independence on July 6 and was silent on Viceroy Lord Linlithgow's offer of Aug. 8 to grant India dominion status after the war. On Sept. 17 the All-India congress committee elected Gandhi its leader by a vote of 192 to 7; only the communist members opposed him.

Garland, (Hannibal) Hamlin (1860-1940), U.S. author, was born in West Salem, Wis., Sept. 14, and died in Hollywood, Calif., March 4. For a biographical sketch see *Encyclopædia Britannica*, vol. 10, p. 27.

Gas, Natural: see NATURAL GAS.

Gas-Electric Bus: see ELECTRIC TRANSPORTATION: *Self-contained Units*.

Gas Masks: see CHEMICAL WARFARE.

Gasoline. Estimates of the amount of gasoline necessary for one day's operation of bombing and pursuit planes alone in military operations in Europe, total the incredible figure of more than 2,225,000 gal.—sufficient to operate 3,000 American passenger cars for one year. The gasoline consumption of the German army in the few weeks of its drive through the low countries and into France is estimated to have been greater than its consumption during the entire four years of the war of 1914-18. The relative positions of Germany and Britain as to oil supplies found Britain in 1940 the stronger (see PETROLEUM), despite the building up by Germany of a huge synthetic gasoline industry from coal and lignite.

Civilian consumption of gasoline in belligerent countries in 1940 practically ceased and the same was true in non-belligerent, occupied countries or countries within blockade zones. Horse-drawn vehicles and bicycles came back. The principal business of some of the automobile companies in France and Belgium was the manufacture of small trailers carrying equipment to generate gas from charcoal.

The ban on civilian consumption of gasoline tended to defer the day of shortage for the belligerents. Germany had hoarded gasoline for years. She seized great stocks in Belgium, Holland and France. Up to Jan. 1, 1941, neither the axis powers, nor Britain, suffered any actual shortage of gasoline supply.

Because of the collapse of France and the blockade of continental Europe and part of Africa, gasoline exports from the United States for the first nine months of 1940 dropped 48% from the corresponding period in 1939.

Consumption of oil in the United Kingdom in the 12 months to Sept. 1940 was estimated to have been at 35% to 40% less than in the preceding 12 months. In Italy, where rationing of gasoline started on Sept. 1, 1939, it was estimated that consumption declined 60% to 70%. No figures were, in 1940, available for Germany, but it was known that the civilian consumption of oil there was restricted severely.

As to quality of the product available to the belligerent powers, Britain demonstrated a distinct advantage over the axis. Her resistance to what seemed overwhelming odds in the number of planes was made possible, to no small extent, by the superiority in the quality of her aviation gasoline. Germany had little better than 87-octane gasoline, usually containing excessive quantities of lead, whereas Britain had the benefit of her own and American aviation gasoline of 100-octane number or slightly better.

Although the advantage of high-octane gasoline in making possible higher compression engines has long been understood, it remained for Britain to demonstrate its tremendous value to aviation in war. In aviation, the more efficient high compression engines have three advantages—first, a smaller fuel load; second, a lighter engine per horsepower and third, less head resistance due both to a smaller engine and a lower cooling load, because more heat is converted into work and less rejected to the atmosphere. These advantages mean higher speed and greater load-carrying ability of planes. The difference in British and German aviation fuel, might easily mean a difference of 25 m.p.h. in the top speeds of two fighting planes, giving the control of the attack or retreat to the faster plane.

Britain had available in 1940 through U.S. purchases large supplies of this vital high-octane aviation gasoline. While ordinary motor gasoline was making its steady climb from 50-octane during the war of 1914-18 to around 75-octane at the outbreak of the war in 1939, U.S. refinery technicians with army and navy representatives sought to reach the goal of 100-octane for military aviation. In 1930, such a fuel was available only in laboratory quantities at a price of \$10 per gallon. As a result of research and the development of several synthetic methods, 100-octane gasoline was available in 1940 in large quantities at around 15 cents a gallon. The raw materials for these synthetic processes are certain constituents of natural and refinery gas, available in suitable quantities in almost any large refinery. The final product usually contains some fairly high octane straight-run gasoline and other constituents including not more than 3% of tetraethyl lead.

The U.S. petroleum industry installed synthetic capacity beyond the domestic and foreign demands. The development of super-gasoline had an important bearing on the United States national defence program which called for plane manufacture to exceed that of any other country. Robert E. Wilson, oil advisor to the Advisory commission of the National Defence Council, stated in 1940 that the installed capacity is, however, barely enough to meet probable peacetime requirements, including airports, once the advanced aviation training program is underway and is substantially less than enough to meet estimates of full wartime demand after the United States plane-building program is complete. He advocated the building up of stocks of this fuel and that no more synthetic product be diverted to motor fuels.

Additional synthetic capacity could also make it possible to improve further the octane rating of gasoline used by the military service, he said, or it could be used to increase the quantity of 91-octane available for training purposes. Gasoline of 91-octane number is to be the main reliance for more than half of the training activities of the service, and will also be widely used by the air lines and as a constituent of 100-octane gasoline. The petroleum industry in 1940 was working closely with the defence commission to guard against any bottlenecks in supplying high-octane gasoline for defence requirements.

The petroleum industry was, in 1940, probably the best equipped industry in the United States to do the job required under the national defence program. This is largely due to two factors: first, the industry has utilized every opportunity for scientific advance with large home resources available, and second, it has expanded production and hence use of petroleum products to an extent not even closely approximated in any other country.

Oil-producing states which practised proration and conservative principles have built up tremendous underground reserves of crude oil, available at a moment's notice for practically any emergency. The industry pursues a normal activity toward making new discoveries.

Civilian demand in the United States is so large that it dwarfs very possible military demand except for a few special products. There was in 1940 one motor car to every four persons in the United States, and the family life and residence revolved largely around the automobile. In cities like Chicago and St. Louis from 40% to 55% of the people entering the central zone of the city do so by means of gasoline. Therefore, curtailment of civilian use of gasoline in the United States while capable of releasing huge supplies for military purposes is not as easily accomplished without acute dislocation. Large systems of motor transportation have been built up. In 1940 the possibility of rationing gasoline to the public seemed remote.

Defence plans, which included the provision of adequate necessary petroleum products to Britain, embraced the expansion of refinery plant and processing for high-octane aviation gasoline. So far as transportation of crude oil to refineries is concerned, there was in 1940 adequate capacity in existing pipe lines to take care of reasonable expansion, but it will be necessary to continue to build new lines into new oil fields and to supplement lines into fields where the production is increased.

Gasoline transportation by tank car and pipe line in the interior of the country was, in 1940, also said to be capable of handling a substantially increased load without difficulty.

The most serious possible bottleneck is in tanker transportation facilities, which in 1940 were not adequate to take care of any sharp increase in demand. However, a considerable number of tankers was under construction in 1940. In an emergency, it is stated that arrangements could be made to put a number of foreign tankers into U.S. service.

Also included in U.S. defence plans was the provision of larger storage for some petroleum products, principally of aviation gasoline and fuel oil. At the request of the defence commission, the American Petroleum institute appointed a number of regional committees to study the question of adequate protection from possible bombing attack of such storage facilities as well as existing industry storage tanks and terminals. (See also PETROLEUM.)

Gatti-Casazza, Giulio (1869–1940), Italian opera director, was born in Udine, Feb. 3, and died in Ferrara, Sept. 2. For a biographical sketch see *Encyclopædia Britannica*, vol. 10, p. 71.

Gaulle, Charles de (1890–), French soldier and leader of the forces of "free France" after the armistices of June 22–24, 1940, graduated from St. Cyr military college at Paris shortly before the German invasion of France in 1914. Wounded three times during the war, he was captured by German troops at Verdun in 1916, but escaped and saw further action on the western front and in the near east. Foreseeing the future tactical importance of tanks and combat cars, he waged a one-man campaign to persuade France to mechanize her infantry after 1918, but army officers preferred to place their trust in such measures of immobile defence as the Maginot line. The first several days of Germany's lightning thrust through Belgium and the Netherlands in May 1940 proved the correctness of de Gaulle's theories and he was belatedly made undersecretary of war in Reynaud's cabinet. He parted ways with Marshal Pétain's government when it elected to surrender and he fled to London. Here on June 23 he announced formation of the French National committee, an expatriate military and political organization which by the end of November claimed 35,000 troops and 20 warships. Much

of French Equatorial Africa, French Oceania, French India and Caledonia rallied to de Gaulle's banner despite the fact that the Vichy government had condemned him to death *in absentia* for treason on Aug. 2. After an abortive attempt to capture Dakar, Senegal, with the support of British warships Sept. 23–25, 1940, de Gaulle landed troops at Libreville Nov. 9 and within three days had secured all of Gabun. A month later his troops were reported active in the British counteroffensive against Italy in North Africa.

General Federation of Women's Clubs: see WOMEN'S CLUBS, GENERAL FEDERATION OF.

Genetics. In 1940 genetic studies on over 80 organisms were published. Of these man, *Drosophila*, poultry and mouse received the most attention among animals, and corn, wheat and *Tradescantia* among plants.

Human Genetics.—Through the study of a large family pedigree in which colour-blindness and night-blindness appear, White and Haldane demonstrated the linkage of these two factors. They established a cross-over value of 43%. This important step in human genetic analysis indicated that the X-chromosome map of man is long. By analyzing all data on tumours in twins, including 15 new cases, Macklin concluded that incidence and specificity of tumours in identical twins are higher than in fraternal twins. Of particular interest to the lay reader is a new book by Newman on *Multiple Human Births*. The Dionne quintuplets furnish critical material for the nature-nurture problem.

Animal Genetics.—Hutt and Lamoreux published a summary of linkage in the fowl, with 23 genes assigned to six linkage groups. Photographs of these and their wild-type alleles are included. After summarizing all pertinent linkage data Punnett concluded that the X-chromosome in the fowl is very long. Gruneberg described the anaemias produced by two dominant spotting alleles in mice. Chen discovered a number of polyploid races of *Paramecium bursaria*. He found that races with different chromosome numbers may conjugate, resulting in ex-conjugants with equal chromosome numbers. Thus conjugation counteracts chromosome variability. White reported a population of grasshoppers in which a reciprocal translocation has occurred between two chromosomes. An extensive monograph on genetic studies in *Drosophila* was published by J. T. Patterson and colleagues. They analyzed the phenotypic effects of many chromosome irregularities, and succeeded in making several new sub-species crosses. On cytological and morphological grounds Sturtevant proposed a tentative phylogeny of the sub-genera and species-groups of *Drosophila*. Muller reviewed work on structural changes in *Drosophila* chromosomes, particularly following X-ray treatment. White brought together all the data on multiple sex chromosomes.

Plant Genetics.—Darlington and his co-workers published a series of papers dealing with the mechanics of meiotic cell division through studies on diverse groups of plants, utilizing species hybrids for resolving many of the problems. Sax made a careful analysis of chromosome aberrations in *Tradescantia* following X-ray treatment. He found that for one-hit breaks in the chromatin the number is directly proportional to the time-intensity factor, but for two-hit breaks resulting in aberrations high intensity is more effective. This is owing to the limited time which can elapse between the two breaks if reciprocal fusions are to occur. Riley studied the hybridization in a natural population of three *Tradescantia* species. He found evidence from both cytology and morphology that extensive exchange of chromatin is going on between species. Crane was able to establish the hybrid origin of the hexaploid loganberry by re-synthesizing it through crossing an octoploid and a tetraploid raspberry.

T. Patterson and colleagues, "Studies in the Genetics of *Drosophila*," University of Texas Publication no. 4032 (Aug. 1940). (W. P. S.)

Geographical Society, American: see AMERICAN GEOGRAPHICAL SOCIETY.

Geology. Wars seriously reduced geologic research and publication. The work of many scientists in this field was diverted into technological channels incident to the conflicts.

In the United States the geological survey did an exceedingly large amount of investigative work on sources of supply of strategic minerals in connection with the rearmament program. Interest in conservation of soils, water and mineral resources continued in 1940, as indicated by the publication of considerable material on this subject.

Geomorphology.—*The Origin of Submarine Canyons, A Critical Review of Hypotheses* by Douglas Johnson condenses the latest views on this subject. Late in 1939 there appeared another work in the same field, namely: *Atlantic Submarine Valleys of the United States and the Congo Submarine Valley* by Veatch and Smith. This latter paper is accompanied by several supplementary charts based on the more recent hydrographic soundings on continental shelves. The appearance of Atwood's *Physiographic Provinces of North America* is the latest authentic treatment of the continent from the regional viewpoint.

Historical Geology.—In this field a very important theoretical work to appear was *The Rhythm of the Ages (Earth History in the Light of the Pulsation and Polar Control Theories)* by Grabau. This study presents several applications and a general expansion of the author's original hypotheses derived from his unusually widespread stratigraphic investigations.

Sedimentation.—The trend in this field is towards greater attention to the ancient deposits. In the past few years emphasis was placed on recent sediments, and the data derived from such studies may now be utilized in the interpretation of the structures and other features of older sedimentary rocks.

Structural Geology.—*Strength and Structure of the Earth* by Daly treats of isostasy, gravimetric anomalies and their relationship to the constitution of the earth's interior and broad scale orogenic processes. The fifth edition of *Structural and Field Geology* by Geikie, revised by Campbell and Craig, affords a modernization of this standard source book for engineers and geology students.

Regional Geology.—Vol. 1 of the reports on the *Geological Expedition to the Lesser Sunda Islands* by the Amsterdam university, under the leadership of Brouwer, appeared. This represents a preliminary report on the areal geology and palaeontology of Timor and near-by islands of the Netherlands East Indies, which region is of interest particularly in terms of details of structure found in mountain arcs. Other important contributions to the knowledge of relatively little known portions of the earth were as follows: *Geology of China* by Lee; United States geological survey professional paper *Areal Geology of Alaska*; and *Grönland*, a symposium containing some 20 papers on various phases of the geology of Greenland.

Petrology and Petrography.—Publication of the revision of Short's *Microscopic Determination of the Ore Minerals* was a stimulus to mineralogical research. New features are the more critical determinative tables, a complete section on ore polishing, and a discussion of the new slit photomicrometer technique utilizing reflectivity as a diagnostic property. Researches in experimental

geology included work on the thermal conductivity of rocks such as may eventually serve as a guide to crustal composition and afford useful data on cooling of intrusives and possibly on differentiation of ore deposits of magmatic affinities.

Die Entstehung der Gesteine by Barth, Correns and Eskola is a comprehensive treatment of petrogenesis from the physical, chemical, quantitative standpoint. It represents a unique and very useful condensation and interpretation of the knowledge to date (1940) as regards the origin of principal rock types. A detailed monograph on significant petrographic and structural aspects of the Adirondack region was presented by Arthur F. Buddington as *The Adirondack Igneous Rocks and Their Metamorphism*. In this treatise the controversial anorthosite masses of that region are interpreted as direct magmatic products. Progressive metamorphism of calcareous sediments was studied synthetically by Bowen, who was able to establish a thermal indicator series of minerals most useful in interpretation of contact metamorphic deposits.

Economic Geology.—A significant but controversial contribution on the subject of ore deposition was made by Graton in his article on *The Nature of the Ore-Forming Fluid*. The principles advanced by Bandy in his paper *A Theory of Mineral Sequences in Hypogene Ore Deposits* point toward new advances. The usual studies of mineral deposits indicate a trend towards more consideration of influences of specific structural controls responsible for ore localization. A revised edition of *Coal* by Moore presents a comprehensive work on the geology and distribution of the coal resources of the world. In the field of petroleum geology, geochemical explorations based on analyses of soils are receiving much attention as a possible new method of discovery. The American Association of Petroleum Geologists sponsored an intensive study of the Permian of the western United States. The research committee of this organization also sponsored in 1940, through sub-committees, research on the subjects of sedimentation and reservoir rocks, oil field waters, origin and evolution of oil, and the migration and accumulation of oil. Interest in the conservation of mineral resources and soils is indicated by the appearance of *Conservation in the United States* by Gustafson, Ries, Guise and Hamilton and a revised edition of *Natural Resources and Their Conservation* edited by Perkins and Whitaker.

Source Books.—*A Dictionary of Geological Terms* by Rice, which is essentially a compilation of definitions of terms applicable to major geological fields, was published. (See also MINERALOGY; PALAEOLOGY; SEDIMENTOLOGY.) (F. M. V. T.; J. C. H.F.; B. H. P.)

George VI (1895–), king of Great Britain and Ireland (see *Encyclopædia Britannica*, vol. 10, p. 191), continued, by his example and by his indefatigable attention to his social as well as military and political welfare, to lead his empire during its second year of war. With his own London residence, Buckingham palace, three times bombed from the air (see LONDON), he shared to the full with his people at home all the honours and discomforts of being in "the front line"; and the sympathy shown by him and Queen Elizabeth on their many visits to bombed areas and ruined homes was very highly valued.

The king's public activities were almost entirely connected with the war; the chief exception, being his opening of Church House, Westminster, the new home of the national assembly of the Church of England. His first war investiture was held on Feb. 6, and others followed in April—when relatives of recipients of honours were for the first time admitted as spectators—and later in the year. Among his foreign contacts were his reception of the queen of the Netherlands (May 13) and the king of Norway (June 10) on their taking up residence, and of President Roosevelt's envoy, Sumner Welles (March 11) and M. Raczkiewicz, president of the Polish republic (June 21). Of his public utterances the most important were his inspiring broadcasts to his

KING GEORGE and Queen Elizabeth examining the damage to Buckingham palace caused Sept. 10, 1940, by a German time bomb

empire on Empire Day (May 24) and on Sept. 23. In the former, which was clearly heard in the United States, he drew attention to the disparity between the German and British implications of the term "imperialism," which to the German connotes "the spirit of domination and the lust of conquest" and to the empire that peace in which our institutions may be developed, the condition of our peoples improved, and the problems of government solved in a spirit of good will"; in the course of the latter—again delivered from Buckingham palace—he announced the creation of a new mark of honour for men and women for civilian gallantry, consisting of the George cross, to rank next after the Victoria cross, and the George medal for wider distribution. Following the Empire Day broadcast came the day of national prayer (May 26), when the king and queen, with the queen of the Netherlands, attended divine service in Westminster Abbey.

It was with great regret that the king had to cancel his boys' camp, so long an annual fixture; but a large part of his year was spent in visiting, often accompanied by the queen, troops, munition factories, dockyards and, later, bombed areas in all parts of the country. Canadians, Australians, New Zealanders, the Home Guard, the Auxiliary Territorial service, Auxiliary Fire service and all branches of the civil defence services were reviewed and inspected; in April foreign-speaking soldiers of the empire (to wit, the French-Canadians) for the first time in history mounted the king's guard at Buckingham palace.

(L. H. D.)

George II (1890—), king of Greece, was born at Tatoi near Athens on July 20, the eldest son of King Constantine, and succeeded to the throne for the first time in 1922. Deposed March 25, 1924 after a series of uprisings, he spent the next 11 years in exile until his recall by the Greek assembly in 1935. For his biography, see *Encyclopædia Britannica*, vol. 10, p. 192. On Oct. 28, 1940, the day that Italy began its attempt to conquer Greece through Albania, George assumed command of the army. The next day he received a great demonstration of loyalty from his people in Athens and his popularity increased in proportion to the Greek successes in Albania. (See GREECE and EUROPEAN WAR.) On Dec. 3 he dispatched a plea for assistance to President Roosevelt and four days later received a promise of all possible aid. King George was divorced in 1935 from Elizabeth, daughter of King Ferdinand and Queen Marie of Rumania, whom he had married in 1921. He is childless and has not remarried.

George, Walter Franklin (1878—), U.S. legislator, born Jan. 29 at Preston, Ga.,

began the practice of law in 1901 at Vienna, Ga. after graduating from Mercer university. In 1907 he became solicitor general for a state judicial circuit and by 1917 had advanced to the bench of the supreme court of Georgia. He became U.S. senator in 1922 and was re-elected for four consecutive terms. In 1938 he successfully withstood President Roosevelt's attempt to "purge" him in Georgia's senatorial election. George pursued his unreconstructed ways throughout 1939 and in 1940 attacked the administration for its delays in providing adequate national defence. He also criticized the selective service bill, the excess profits bill of 1940 and the failure of President Roosevelt to seek the advice of congress before consummating the destroyers-bases agreement of Sept. 3, 1940 with Great Britain. Later, however, after he was selected as chairman of the senate's foreign relations committee to succeed the late Key Pittman (*q.v.*) George said that his policy would be to "work in close harmony with the state department."

Georgia, one of the original states of the United States, popularly known as the "Empire State of the South"; area 59,262 sq.mi., being the largest east of the Mississippi river; population according to the U.S. census of 1940, 3,123,723, an increase of 7.4% over 1930. Capital, Atlanta, 302,288. The next largest city is Savannah, 95,996.

History.—Eugene T. Talmadge was elected governor in Nov. 1940 without opposition. In the September primary of the Democratic party Talmadge had easily defeated several opponents and in Georgia the Democratic nomination is the equivalent of election. Talmadge had already served two terms as governor (1932–36), and after the constitutional interval of four years he became the second man in the state's history to hold the office a third term, the other being the Civil War governor, Joseph E. Brown, who was governor four consecutive terms. The other principal state house officers elected were: John B. Wilson, secretary of state (re-elected); Ellis Arnall, attorney general; George B. Hamilton, treasurer (re-elected); Homer C. Parker, comptroller general; M. D. Collins, superintendent of schools (re-elected); Tom L. Linder, commissioner of agriculture. In the presidential election Roosevelt (Dem.) received 265,194 votes (approx. 85%); Willkie (Rep.) 23,934, (Ind. Dem.) 22,428; Babson (Prohibition) 983; Thomas (Soc.) 1.

Finance.—For the year ending June 30, 1940, the common schools received of state funds, \$13,334,532; the various eleemosynary institutions, \$1,842,210; and the university system (embracing all the higher educational institutions supported by the state), \$1,824,525. The state appropriated for the public

health department and the tuberculosis hospital \$703,028. The highway department received \$15,775,343. The total revenues received for the fiscal year amounted to \$44,694,137, the tax on motor fuel producing the largest amount, \$21,841,623. Other important sources were the income tax, \$5,668,184; the general property tax, \$4,995,013; cigar and cigarette tax, \$3,127,225; motor vehicle registration, \$2,053,692; insurance premiums tax, \$933,-

EUGENE TALMADGE, Democrat, elected governor of Georgia Nov. 5, 1940

419; malt beverages and wine tax, \$1,486,228; and alcohol beverage tax, \$1,986,520. Georgia received from the United States government grants amounting to \$10,961,991. The fixed debt was \$27,088,616. According to the federal reserve bulletin the total assets of all Georgia banks in 1940 were \$346,777,000.

Agriculture.—In 1935 there were 250,544 farms. Of these, 85,197 were operated by owners, the rest by croppers and tenants. In 1940 the value of the principal crops was \$163,862,000, 14% above the corresponding figure for 1939. The most important cash crop was cotton, of which the yield was 1,020,000 bales valued at \$48,450,000. Second in value among the cash crops was peanuts, \$17,715,000, 57% above the 1939 figure. Third in value was tobacco, yielding \$12,328,000, somewhat less than in the preceding year. Other important crops were: corn (not a cash crop), \$31,857,000; sweet potatoes, \$6,237,000; peaches, \$5,192,000; pecans, \$1,015,000. Cotton (lint and seed) accounted for 35.5% of the total value of crops; corn, 19.5%; peanuts, 10.8%; tobacco, 7.5%; all other crops, 26.7%. In 1939 the state had 970,000 cattle, 1,554,000 hogs, 31,000 horses.

Manufactures.—The census of manufacturing of 1937 credited Georgia with a total value of \$708,652,000, about five times the value of the agricultural output. Since the raw materials of manufacturing are, however, largely agricultural in origin, a fairer comparison is that with "value added by manufacturing." In 1937 this value was \$269,500,000, less than double the agricultural output, but still significant of trends in a primarily agricultural state. Textiles ranked first among manufactures, cotton goods having been turned out in 1937 to the value of \$211,000,000.

German-American Bund.

The conviction of Fritz Kuhn on charges of theft and falsifying the records of the German-American Bund, of which he was the head, and his sentence to prison in New York in 1939 had a depressing effect on the organization. Kuhn, who before his conviction had appeared before the Dies Congressional committee investigating un-American activities, testified that there were 20,000 members of the bund in 19 states. G. Wilhelm Kunze, publicity relations director, who succeeded him as head of the organization, told a congressional committee in the summer of 1940 that the membership had fallen to 10,000 and that the number of separate units had decreased from 65 to 40. When the Selective Service bill was introduced in congress with a provision that no communist, anarchist or alien radical might be employed in war industries Kunze telegraphed to Washington demanding to be heard in opposition to its passage. He said that he had been informed that the bill explicitly excluded members of the bund from employment in United States industries, and further, that "the proposed legislation is damnable, vicious and a congressional declaration of war upon every German-American." Kunze also opposed the bill requiring all foreign-controlled organizations engaging in political activities to register with the attorney general, giving a list of all persons who contribute to it or pay dues, and requiring the officers of such organizations to report on their activities. His objection to the bill, which was ultimately passed, was that it would destroy the bund. Kunze, when summoned to appear before a subcommittee of the Dies committee investigating bund activities in New Jersey and the alleged connection between the bund and the Ku Klux Klan, denied that the bund had any connection with the klan, but admitted that it was committed to hostility to the Jews when it was necessary for self protection and that regardless of Germany's

understanding with Russia the bund was still opposed to communism. In spite of the denial that the bund had any connection with the Ku Klux Klan 700 members of the New Jersey reality of the klan joined with about 700 members of the bund in a meeting in the bund camp in Andover, N.J., on Aug. 18. The klan members were escorted to the camp by members of the bund. Klan speakers expressed sympathy for the bund members who had been "persecuted for their adherence to the doctrines of Nazi Germany," and condemned the Jews for "attempting to get this country into war." Not long after this meeting Kunze and eight other members of the bund were indicted on the charge of inciting to race hatred. The spokesmen for the bund insisted that only American citizens are admitted to membership. A former member, however, testified before the Dies committee that 25% of the members are alien Germans and that all received military training and are instructed to be prepared for the day when Hitler shall give the word to overthrow the government of the United States and set up a government based on the German model. The Federal Bureau of Investigation which has been looking into un-American activities has prepared an index of potential enemies of the United States. The index, it was announced, contains the name of every member of the bund.

Records seized at the Chicago headquarters of the bund Dec. 17 by the state's attorney's staff indicated that between 1,500 and 2,000 bund members were serving in the U.S. army and navy. The Federal Bureau of Investigation immediately examined the confiscated books and papers.

(G. W. Do.)

Germany, a totalitarian state or dictatorship, known as the "third reich," in central Europe south of the North and Baltic seas and north of the Alps, Italy and Yugoslavia. From 1919 to 1939 East Prussia was separated from the main territory of Germany by the so-called Polish Corridor. Capital, Berlin; reich chancellor and leader (*Fuehrer*), Adolf Hitler (*q.v.*).

Area and Population.—The area of the old reich was 181,744 sq.mi.; population 66,029,806, census of June 16, 1933. The population was distributed among the 18 "Lands" (former states) and among the chief religious denominations in 1933 as shown in Table I.

Table I.—Population by Lands and by Faiths, in 1933

Lands	Total pop.	Evangelical	Rom. Cath.	Jews†	Others
Prussia	39,692,167	25,387,595	12,571,007	361,826	1,613,583
Bavaria	7,681,584	2,293,499	5,379,719	41,939	65,427
Saxony	5,106,652	4,522,856	196,839	20,584	450,373
Württemberg	2,696,652	1,811,797	839,673	10,223	34,826
Baden	2,412,951	943,540	1,408,532	20,617	40,262

Germany	66,029,806	40,955,168	21,755,506	502,302	2,680,005

*Census of 1935. †Jews by religious faith; there are no census figures for Jews in blood; it was estimated that by the end of 1938 the Jews by faith had been reduced to less than 400,000.

There were (1933) 104 cities with a population of more than 50,000 each, and 567 cities and towns with more than 10,000 each. About 32.5% of the population lived in villages of less than 2,000; 10.6% in towns of between 2,000 and 5,000; and 7.3% in towns of between 5,000 and 10,000; almost half the population lived in communities of more than 10,000.

The population of the "greater reich," according to the census of May 17, 1939, was 79,592,000, or 86,400,000 if the "protectorate" of Bohemia-Moravia is included. This greater reich was created by Hitler's annexation of the following territories

STILL-LIFE BY ADOLF HITLER, as conceived by Lewis in the *Milwaukee Journal*. Says Hitler: "Don't eat, save your money, and you can own this masterpiece"

Jan. 13, 1935, Saarland, 864,000; March 13, 1938, Austria, 7,008,000; Oct. 1, 1938, Sudetenland, 2,945,000; March 15, 1939, Bohemia-Moravia, 6,805,000; March 22, 1939, Memel territory, 330,000. In addition, by his war against Poland in Sept. 1939, Hitler added to the 86,000,000 of the greater reich the populations of Danzig, the Polish Corridor, Posen and a strip of territory east of Silesia, regions aggregating 36,242 sq.mi., with a population of 10,000,000. The Poles, as far as possible, were exterminated or removed from these conquered districts and their places taken by Germans from the reich or by tens of thousands of Germans "repatriated" from their old homes in Estonia, Latvia and Lithuania. Hitler also conquered more than half of the west of Poland; its population of about 15,000,000 was organized under a national socialist administrator, Dr. Hans Frank, as the "general government" of Poland. Poles, if loyal to their conquerors, were allowed to hold subordinate official positions. Half a million Jews were herded into a walled ghetto in Warsaw.

The reich also controlled more or less completely the governments of the populations conquered in the spring and summer of 1940: Denmark (3,777,000), Norway (2,900,000), Netherlands (6,640,000), Belgium (8,386,000), Luxembourg (300,000) and the northern three-fifths of France, known as "occupied France" (17,000 sq.mi. with an estimated population of 27,800,000). The remaining two-fifths of the former French republic, known as "unoccupied France," and the French colonial empire were left under the Vichy government of Marshal Pétain. Some 70,000 French families were suddenly expelled from Lorraine to unoccupied France, and Lorraine ceased to exist. On Nov. 30, 1940, it was incorporated directly into the "third reich" and combined with the Saar territory under *Gauleiter* (District Leader) Joseph Terckel as the "Westmark"; this corresponds to the former Austria which became the "Ostmark" upon its annexation by Hitler in 1938. Alsace, from which French families were also expelled in large numbers, was placed under the administration

of Robert Wagner, *Gauleiter* of Baden.

In addition, by the infiltration of large numbers of German troops, the reich dominated in the autumn of 1940 the three Danubian countries: Slovakia, Hungary and Rumania.

History.—After the lightning war (*blitzkrieg*) against Poland in Sept. 1939, Hitler's armies remained comparatively quiet for six months, except for mopping-up operations in conquered Poland. He did not attack the strong French Maginot line in the west because it would be too costly in life, and because he at first hoped to detach France from Great Britain by a separate peace. So for seven months the war in the west was a *sitzkrieg* in which the French and German soldiers spent most of their time sitting in the strong defensive fortifications of the Maginot line and the Westwall.

On April 9, 1940, Hitler suddenly renewed his *blitzkrieg* tactics by an invasion of Denmark and Norway. In Denmark King Christian, seeing that resistance would be useless, accepted German "protection" and was allowed to remain as nominal ruler while German troops and police occupied and controlled his kingdom. In Norway German troops, with the aid of German spies and "fifth columnists," seized the principal ports within a few hours. King Haakon and his ministers fled from the capital, Oslo, and the Norwegian people, recovering from their surprise and consternation, attempted to defend their independence. British and French troops, landing at Narvik and near Trondhjem, tried to aid them, but were forced to withdraw. Within two months, by June 9, Hitler was in virtual control of all Norway. He placed the administration in the hands of a nazi commissioner, Josef Terboven, aided by a Norwegian traitor, Vidkun Quisling. King Haakon, his ministers and many Norwegians fled to England to carry on the struggle from abroad.

On May 10 Hitler began a similar *blitzkrieg* against his neighbours in the west. The Netherlands was overrun in five days and placed under the rule of Dr. Arthur Seyss-Inquart, the nazi who had helped Hitler to seize Austria in 1938. Queen Wilhelmina fled to England and retained her rule over the Dutch colonies. Belgium was likewise overrun in 18 days. On May 28 King Leopold surrendered his army and was allowed to remain as nominal ruler, but his country was completely under German domination.

French and British forces, advancing too far in coming to the aid of the Belgians, were cut off and pocketed by rapidly moving German tanks and mechanized troops and forced to retreat toward Dunkirk. From this channel port about 355,000 French and British were evacuated with remarkable success and heroism between May 29 and June 4. Hitler might possibly have succeeded in invading England at this time if he had tried, but he preferred to push quickly deep into France, where the ministers, divided against themselves, asked for an armistice, which was signed on June 22. By its terms German troops were to occupy the northern three-fifths of France until a final peace was signed, while unoccupied France, the French fleet and the colonies were left under the rule of Marshal Pétain and his government at Vichy.

Hitler failed to crush Britain, though he had promised his people he would do so by the middle of August. From the outset of the war he tried to weaken Britain by attacking its commerce and supplies from overseas. Within 16 months his mines, submarines, surface-raiders and air-bombers had sunk more than 4,000,000 tons of British and Allied merchant shipping. In Aug. 1940 his planes began to rain a terrible destruction on London and other British cities. But these attacks did not weaken the British determination to continue the war for the overthrow of the nazi domination of Germany and Europe, nor did they weaken Britain sufficiently for Hitler to attempt his much-talked-of invasion of England.

In the summer of 1940 German troops entered Rumania in large numbers, caused the flight of King Carol and helped establish a pro-nazi Iron Guard regime. In Jan. 1941 German troops were massed on the frontier of Bulgaria as if to attack the British in the eastern Mediterranean area or to aid Italy against the victorious Greeks in Albania.

Education and Religion.—Education has gone through a drastic reorganization under nazi rule. The period of school attendance was shortened by one year in 1937. Many new schools have been established for giving a year or two of professional or technical training; for many students this will replace the last years at the regular schools or at universities and the older technical institutes (*Hochschule*). Many schools have also been established for training "leaders" for the nazi Party and for government positions; emphasis in them is placed on comradeship, sports, nazi ideology and leadership.

Attendance at Germany's universities has been considerably cut down since the nazi revolution, partly owing to government restrictions upon attendance, partly owing to the decline in the quality of teaching as a result of the dismissal or resignation of Jewish and liberal professors, and partly owing to other causes. The government tends to shift students from the large city universities to the smaller town universities, especially those in eastern Germany, where nazi influence is stronger. Thus, the figures for attendance in the winter semester of 1929-30, and the limiting quotas fixed by Bernhard Rust, the reich minister of education, for the winter semester of 1937-38, were for the larger universities respectively: Berlin, 16,149, 6,000; Cologne, 7,162, 2,400; Frankfurt, 5,242, 1,700; Hamburg, 3,995, 1,700; Munich, 9,028, 4,800.

By the end of 1939 there was a serious shortage of school-teachers, skilled engineers and members of some other professional classes. As a result, university attendance again increased in 1940, especially in the technical and national science departments.

The Evangelical Protestants and the Roman Catholics, whose numbers and distribution are given in the table on p. 316, have suffered what they regard as severe persecution under the nazi regime. The Protestant regional churches took steps in 1933 to form a single reich church in accord with Hitler's general policy

of centralization. But aggressive nazis, who ordinarily seldom attended church and who indulged in semipagan views, mobilized their efforts to secure the election of Ludwig Mueller as rector of the new church. This caused a split, which has grown deeper and deeper, between the official Evangelical Church and the really devout Christian Opposition pastors and their followers led by Dr. Martin Niemöller who has been in a concentration camp for several years.

Pope Pius XI signed with Hitler in 1933 a concordat guaranteeing to the Roman Catholics the free exercise of their religion, their religious schools and their various religious youth, professional and charitable organizations. The guarantees have not been observed. The Vatican radio broadcast on Jan. 28, 1940, parts of a long memorandum by Cardinal Hlond, primate of Poland. The full text of 11,000 words was given to the press by the Polish embassy at the Vatican. It gave proof of the terrible persecutions of Roman Catholics after the German conquest of Poland. It recited, with precise names and places, the long list of priests shot or beaten to death; of 631 churches, 454 chapels and religious buildings ruined or plundered; and of religious publications suppressed. Hitler's foreign minister, Joachim von Ribbentrop, on his visit to Rome on March 10 had a 65-min. audience with Pope Pius XII, but it was reported that the meeting was a very short one. The German Roman Catholic bishops held their annual meeting at Fulda in August, but it was stated that their pastoral letter would not be published as usual, but would be withheld until the end of the war.

Finances and Banking.—No exact statement can be made regarding the German government's revenues and expenditures; the budget has not been published since 1935. The taxes collected by the reich central government have quadrupled since Hitler came to power, being about 6,000,000,000 marks for 1932-33, and officially estimated at more than 26,000,000,000 for the first year ending March 31, 1941. This does not include about 5,000,000,000 marks levied by the "Lands" and local communities (*Gemeinde*).

The war economy decree of Sept. 4, 1939, increased the rate of taxation on many objects, but the increase was not as large as might have been expected in a nation at war, because Germany for some years had been virtually on a wartime economy. To illustrate what he called the comparatively slight tax increase caused by the war, the state secretary of the reich finance ministry on Aug. 23, 1940, gave comparative figures for collections from six of the larger tax sources for the April-July period of 1939 and his estimates for the same four months in 1940; his figures in millions of marks, are shown in Table II.

Table II.—Comparative Tax Collections for Four Months, 1939 and 1940

Four months' tax	Collected in 1939	Estimated for 1940
Wage tax	876.8	934.5
Income tax	1,430.0	1,503.2
Sugar tax	132.2	153.1
Beer tax	106.4	204.9
Tobacco tax	355.3	471.3
Property tax	106.2	126.5
Totals	3,096.9	3,393.5

The exact debt is also unknown because the large amounts of treasury bills issued to build armaments, auto highways and other public works are not counted in the debt until they fall due. Between 1935 and Sept. 1939 the government publicly increased the reich debt by issuing 13 long-term loans totalling over 15,000,000,000 marks, in order to take care of treasury notes as they fell due and to consolidate the short-term indebtedness. This

ON THE MORNING of April 9, 1940, the day Germany invaded Norway, Foreign Minister von Ribbentrop (leaning on table) explained to a press conference in Berlin that the invasion's purpose was to protect Norway from Great Britain and France.

VN STREETS STREWN WITH FLOWERS by Hitler Maidens the Fuehrer
 e his triumphal return to Berlin July 6, 1940 from the western front

as all bore $4\frac{1}{2}\%$ interest, were issued at 98 $\frac{3}{4}$ and were quoted
 Jan. 1941 at about 102. They do not include two 5,000,000-
 mark loans issued by the state railway (*Reichsbahn*) in 1936 and
 1939, nor loans by other government enterprises. At the beginning
 of the war the government ordered the establishment of a credit
 of 15,000,000,000 marks, and in April 1940 issued 4,000,000,000
 marks' worth of treasury notes bearing interest at 4% instead of
 the previous rate of $4\frac{1}{2}\%$. It was announced that new treasury
 notes to be issued in Jan. 1941 would bear only $3\frac{1}{2}\%$ interest.

The officially recorded debt of the reich on Aug. 31, 1940, was 66,500,-
 000 marks, indicating that the total borrowings during the first year
 of the war were 29,000,000,000 marks; i.e., that the debt had nearly
 doubled. These figures, however, are generally considered by foreign ex-
 perts to be much smaller than the real debt. It was estimated that the
 monthly increase in the debt during the last four months of 1940 was
 at 3,000,000,000 marks a month.

The cost of building Germany's war machine was publicly stated by
 Hitler on Sept. 1, 1939, to have been 90,000,000,000 marks (about \$36,-
 000,000,000). The cost of running the war machine averaged about
 10,000,000 marks a month during 1939 and rose to nearly 5,000,000,000
 marks a month during the last half of 1940. About half the monthly cost
 was met from current taxation, and the other half by government borrow-
 ing from savings banks, insurance companies and other public credit insti-
 tutions. After June 25, 1940, when the armistice with France became
 definitive, the French became obligated to bear about 15% of the German
 war cost, because they had to pay for the support of the large German
 troops in "occupied France," amounting to about 600,000,000 marks a
 month. In addition, France had to pay for the support of more than
 1,000,000 French prisoners in Germany. The protectorate of Bohemia-
 Moravia likewise was assessed approximately 200,000,000 marks a year in
 return for its exemption from maintaining an army of its own, after the
 German army became guarantor of the protectorate's security.

The reichsbank's gold and foreign exchange reserves, which were about
 10,000,000 marks in 1932, had shrunk, according to its official reports,
 to 5,566,000 marks on Dec. 31, 1940. It afforded only a 0.53% coverage
 for paper money, as compared with 24.3% in 1932, and with the 40%
 which before the World War of 1914-18 was considered the lowest cov-
 erage compatible with safety. The reichsbank paper bank note circulation
 on Dec. 31, 1940, was the largest in its history, being 14,033,000,000
 marks, as compared with 11,798,000,000 and 8,222,000,000 at the end
 of 1938 and 1939 respectively. This increase in paper money and govern-
 ment borrowing and spending would normally tend toward an inflation of
 prices and a rise in the cost of living, but the government by very rigid
 control of wages and prices managed to keep the price level close to
 what it was at the outbreak of war. Most of the countries conquered during
 the war succeeded in getting a large part of their national gold reserves to
 themselves before the Germans could seize it. Nevertheless, the Germans
 probably acquired considerable amounts of gold and foreign exchange
 which they did not publish in their reichstag reports, but which were used
 for buying war materials, propaganda abroad and other war purposes,
 which was being secretly hoarded for future war uses.

The standard of currency is the German mark, equivalent in U.S. money
 to 33.25 cents. Owing to the government's rigid control, its official ex-

change value is kept very close to its American and foreign equivalent, but
 in fact there are many kinds of marks whose actual value depends on where
 and by whom they are used. There is also a special mark paper currency for
 use in several of the lands occupied by German troops.

Trade and Communication.—Since 1935 Germany's exports and imports
 have been very strictly controlled, first by Dr. Schacht's "new system,"
 then by Goering's dictatorial economic power as commissioner for the
 four-year plan, and finally by the ministerial council for reich defence,
 established by Hitler on Aug. 30, 1939, and headed by Goering with sweep-
 ing powers to co-ordinate economic and administrative activity. Germany's
 imports and exports and resulting balance of trade during the years 1932-39
 are shown in Table III.

Table III.—Imports, Exports and Balance of Trade, 1932-39

	Total Yearly			Monthly Average		
	Imports Million marks	Exports Million marks	Balance Million marks	Imports Million marks	Exports Million marks	Balance Million marks
1932 . . .	4,667	5,739	+ 1,072	389	478	+ 89
1933 . . .	4,204	4,871	+ 667	350	406	+ 56
1934 . . .	4,451	4,167	- 284	371	347	- 24
1935 . . .	4,159	4,270	+ 111	347	356	+ 9
1936 . . .	4,218	4,768	+ 550	352	397	+ 46
1937 . . .	5,468	5,911	+ 443	456	493	+ 37
1938* . . .	6,052	5,620	- 432	504	468	- 36
1939† . . .	2,755	2,814	+ 59	458	468	+ 10

*Figures do not include Austria and Sudeten area.

†Figures are for the first six months of 1939 only.

The above figures show that the imports tend to increase, especially
 in 1937 and 1938, while the exports increase less, with the result that the
 balance of trade becomes less favourable. Among the reasons for this is
 the fact that Germany has increased its imports of raw materials for its
 rapidly growing armaments, and to some extent its imports of food for
 its people and fodder for its cattle. The figures do not include the exports
 and imports of the annexed Austrian and Sudeten territories. If they did
 so, the deficit in the trade balance would have been greater in 1938, since
 Austria and the Sudeten territories have always had to import a larger
 proportion of their food than has Germany; as far as Germany's food
 problem goes, these two territories are a liability rather than an asset to
 Germany.

With the outbreak of war Germany ceased publishing official statistics
 so that no exact trade figures were available for 1940. From other sources,
 however, it is clear that Germany was at once cut off from almost all its
 overseas trade and thus deprived of half of its normal foreign commerce.
 To compensate for this loss it sought to intensify its trade with its im-
 mediate continental neighbours by trade agreements: with the soviet union
 in Oct. 1939 and in Feb. and Dec. 1940; with Rumania on Dec. 4, 1940,
 for the delivery of 3,000,000 tons of oil during 1941; and with Sweden on
 Dec. 18, 1940, for an increase by one-half of the existing trade between
 the two countries. By these and other trade agreements, Germany aimed
 to get food, fodder, iron ore, bauxite, petroleum products and other war
 materials, in exchange for German coal, machinery and manufactured
 goods. By its much-advertised "new order" in Europe it also sought to
 make Berlin as much as possible the trading centre for continental Europe
 by making its neighbours clear their trade accounts in marks through Berlin
 as a clearing centre instead of settling their accounts directly with one
 another.

Enemy countries and neutrals had accounted before the war for a large
 proportion of the reich's imports of strategic raw materials—98.5% of the
 cotton, 87.7% of the copper, all of the rubber and 44.1% of the iron ore.
 Gasoline and lubricants continued during 1940 to be one of the reich's
 most serious needs, since the annual domestic production of 4,000,000
 tons of synthetic gasoline, plus imports from Rumania and Russia, hardly
 sufficed to meet German industrial and war demands. By its conquest of the
 Belgian and French iron and coal industrial areas and by the agricultural
 and dairy products of conquered Poland, Denmark and the Netherlands,
 Germany was able to improve considerably its war economy during 1940
 and partly offset the effects of the British blockade. Tariff charges were
 abolished between the reich and Bohemia-Moravia on Sept. 15, 1940, and
 between the reich and the Netherlands on Dec. 18.

The German state railway (*Reichsbahn*) included in 1938, prior to the
 annexation of Austria and other lands, 53,330 km. (33,076 mi.) of
 standard-gauge lines and 879 km. (546 mi.) of narrow-gauge lines.
 Privately owned lines included 3,732 km. (2,313 mi.) of standard and
 752 km. (476 mi.) of narrow gauge. Owing to Hitler's great efforts at
 rearmament and public works, the railways were not kept up in proper
 repair with adequate replacement of roadbed and rolling stock. As a result
 the railways had difficulty in meeting the added strain of war. This was
 particularly true in the case of hauling oil in tank cars from Rumania
 and in making coal deliveries to Switzerland, Italy and throughout the
 reich during 1940. In Nov. 1939 the German railway floated a loan of
 500,000,000 marks to add new rolling stock and to improve and extend
 the rail network to the east.

By the middle of 1939 Germany had completed and opened to traffic
 3,065 km. of the new automobile highway network (*reichsautobahn*);
 1,383 km. were under construction and preliminary work was proceeding
 on 2,449 km. The outbreak of war compelled Germany to cut this building
 program by half. Work was continued only on those stretches which were
 of greatest strategic or economic importance, particularly in linking Ger-
 many with its newly acquired territories in the east. The volume of motor
 traffic was also sharply curtailed for the duration of the war in order to
 economize on gasoline. The number of private autos in circulation was cut
 to 15% of the prewar total. Many trucks were converted to use methane or
 butane gas instead of gasoline as a motor fuel.

Table IV.—Agricultural Production from 1932 to 1939
(In thousands of metric tons)

	Rye	Wheat	Barley	Oats	Potatoes	Sugar Beets	Fodder Beets
1932 . . .	8,303	5,003	3,214	6,650	47,016	7,875	34,486
1933 . . .	8,727	5,004	3,408	6,952	44,071	8,578	30,716
1934 . . .	7,007	4,532	3,203	5,452	40,780	10,394	33,804
1935 . . .	7,478	4,007	3,387	5,385	41,015	10,507	34,711
1936 . . .	7,380	4,426	3,390	5,618	40,323	12,095	37,826
1937 . . .	6,920	4,580	3,640	5,920	53,000	15,701	40,538
1938 . . .	8,403	5,502	4,177	6,274	48,700	17,200	41,700
1939* . . .	—	—	—	—	54,540	17,400	39,500

*Figures for 1939 are estimated. The total grain harvest was estimated at 27,430,000 metric tons, i.e., 6.4% more than the total for 1938.

German inland shipping at the beginning of the war included 5,373 vessels moving under their own power and totalling 528,000 tons; and 12,488 canal boats and other vessels without power, totalling 5,835,000 tons. High seas shipping included 3,579 vessels with a total registered net tonnage of 2,238,000. During the war, aside from trade in the Baltic, German ocean-going vessels were mostly kept tied up in home ports or in neutral ports abroad. Some vessels which were caught by the British at the beginning of the war or which tried to return home, like the luxury liner "Columbus," were sunk or captured by the British or scuttled by their own crews. Such German shipping losses are estimated to have totalled more than 1,000,000 tons.

Agriculture, Manufactures, Mineral Production.—Germany's agricultural production in the prewar years in thousands of metric tons was as shown in Table IV.

The grain harvests of 1940 were officially stated to be "average good," but no exact figures were published. The sugar-beet and potato crops of 1940 were said to be particularly good, exceeding those of 1939 and providing an exportable surplus, besides yielding ample quantities for food-stuffs and fodder. The potato yield was said to be 57,000,000 tons, the largest in Germany's history.

The latest available figures for Germany's mineral and manufactured products, in metric tons, are shown in Table V.

Table V.—Production of Minerals and Manufactured Products, 1933–37
(In metric tons)

	1933	1934	1935	1936	1937
Coal . . .	109,532,600	125,405,600	143,491,300	159,756,600	184,500,000
Lignite . . .	126,756,600	137,223,400	147,102,100	161,426,900	184,700,000
Iron Ore . . .	2,592,000	4,343,000	6,044,000	7,570,000	9,792,000
Lead . . .	91,000	98,400	122,300	139,000	158,500
Zinc . . .	162,000	212,800	205,000	207,700	194,300
Rock salt . . .	1,841,300	2,024,200	2,077,200	2,383,800	2,707,000
Potash . . .	7,362,800	9,610,700	11,672,500	11,764,600	14,400,000
Pig iron . . .	5,246,500	8,716,700	12,846,200	15,302,500	15,900,000
Steel . . .	7,393,200	11,601,700	16,013,500	18,590,900	19,387,000

As a result of Germany's conquest of the resources of Austria, Czechoslovakia, western Poland, Belgium and northern France, its mineral and manufacturing products were greatly increased, but they mostly had to be devoted to war purposes so that it was in a less favourable position to export goods. Increased capital and labour were devoted to the production of substitute (*Ersatz*) products—synthetic gasoline, rubber, soap, textiles, plastics—in place of imported goods or goods made from imported raw materials. Many of these substitutes are fairly satisfactory, but they require more labour and cost more than the old natural products. Even before the war, Germany suffered from a labour shortage; this became more serious with the mobilization of men into the army. The labour shortage in 1940 was partly met by bringing in large numbers of captured Poles, Belgians and Dutch to work in German fields or factories; French prisoners, who numbered nearly 2,000,000, were also in many cases set to work. Some 70,000 Italians went to work in the reich.

Gibbs, George (1861–1940), U.S. engineer, was born in Chicago, April 19, and was graduated from the Stevens Institute of Technology in 1882. After serving with western railroads he became consulting engineer for the Baldwin Locomotive works in 1897. He was also employed by the Westinghouse interests. He had charge of the electrification of the Pennsylvania and the New York Central railroad systems and built the first all-steel railroad car. He was president of the American Institute of Electrical Engineers. He died in New York city May 19.

Gibraltar: see BRITISH POSSESSIONS IN THE MEDITERRANEAN.

Gibson, Ernest Willard (1871–1940), U.S. senator, born in Londonderry, Vt., Jan. 29. He was graduated from Norwich university in 1894 and studied law at the University of Michigan in 1898–99 after having served four years as the principal of the high school in Chester, Vt. He began to practise law in Brattleboro, Vt., in 1899. He was a member of the Vermont house of representatives in 1901 and the senate in 1908. He was elected to the U.S. house of representatives in 1922 and served continuously until he was appointed in 1933 to fill a vacancy in the senate. He was elected to a full term as U.S. senator in 1938. In the senate he served as a member of the committee on naval affairs. He died in Washington, June 20.

Gill, Eric Rowland (1882–1940), British sculptor, born in Brighton, Feb. 22, and died there, Nov. 17. For a biographical sketch see *Encyclopædia Britannica*, vol. 10, p. 353.

Gilmour, Sir John (1876–1940), British statesman, born May 27. After studying at Edinburgh and Cambridge universities he entered the army, serving in the Boer war in 1900–01. Soon after his return to England he was elected to parliament and served a total of 22 years. He fought in the World War of 1914–18, rising to the rank of lieutenant colonel. He entered the cabinet in 1926 as secretary of state for Scotland. He served successively as minister of agriculture and as secretary of state for the Home department. Prime Minister Chamberlain made him minister of shipping in 1939, and gave him control of the entire merchant fleet. He died in London, March 30.

Girl Scouts. In response to world needs, Girl Scouts in 1914 put increasing emphasis on citizenship and service activities. Service bureaus were organized in scores of communities throughout the United States. These bureaus acted as clearing houses for local agencies to make known their needs and for Girl Scouts to register for useful community service. Girls volunteered thousands of hours of work in day nurseries, clinics, settlements, playgrounds and the offices of welfare groups.

War in Europe made it impossible to hold the usual international gathering at Adelboden, Switzerland. Instead, Girl Scouts of the United States were hostesses to Girl Guides from Canada, Newfoundland, Cuba, Jamaica, Trinidad, Curaçao, Mexico, Panama, Guatemala, British Guiana, Brazil, Bermuda and Argentina at a western hemisphere encampment held at Camp Andree, near Pleasantville, N.Y. The newly formed western hemisphere center of the World Bureau of Girl Guides and Girl Scouts carried out many of the suggestions made by the girls at this encampment.

Their sister scouts and guides in war-torn countries were not forgotten. Thousands of dollars, contributed in pennies by Girl Scouts all over the country, were sent to China and to Europe. A Christmas present to the Girl Guides of Great Britain was made up of two mobile canteens, an ambulance, 90 air raid shelter units and 330 lb. of knitting wool.

At the end of 1940 there were approximately 640,000 members of the Girl Scout organization in the United States. Of these about 100,000 were adults, the rest, girls ranging in age from seven to eighteen. (C. M. R.)

ass. During 1940, the importation of glassware from Europe practically ceased. As a result, a number of small items herto exclusively imported began to be produced in America. Among these were microscope slides and cover glasses. The domestic production of optical glass was stimulated, and the mechanical production of Christmas tree ornaments became important. Successful processes were announced for the treatment of surfaces of optical glass to eliminate reflection and increase transmission and definition of camera lenses and other lens systems. The design of machine-blown bottles was improved by rounding off the angle at the base, reducing sensitivity to pressure and shock. Progress was made in the production of bottles of light weight and even distribution of glass. The year's production of bottles and containers is estimated at 58,000,000 gross. Window glass production was estimated at 600,000,000 sq.ft. 80% of capacity and plate glass production exceeded 150,000,000 sq.ft., most of it made for automobiles. Glass building blocks began to be made in quantity, establishing a virtually new industry.

The effect of improved methods of mechanical production was reflected in the report of the 1939 Census of Manufactures which gave the number of operating glass plants in the U.S.A. at 229, the lowest in several decades. The total value of glassware manufactured was given at \$358,000,000.

Under the name of "Pyrex Vycor" the high-silica glass announced in 1939 was in 1940 being made in a number of laboratory utensils. The coefficient of expansion of this glass is less than 8×10^{-7} which is less than 1/10 the expansibility of ordinary bottle glass.

Mirror manufacture was improved and cheapened by the introduction of the Peacock process in which the silvering solution with its reducing agent is sprayed upon the glass, and an adherent coating of silver is almost instantly deposited.

The federal suit against patent-holding companies was not decided by Jan. 1, 1941. (*See also* FELDSPAR; SELENIUM.)

(S. R. S.)

Glenn, Mary Willcox (1869-1940), U.S. welfare worker, was born in Baltimore, Dec. 14. She was secretary of the Children's Aid society of that city from 1897 to 1901. In 1902 she married John Mark Glenn, a lawyer in New York city, who became a general director of the Russell Sage foundation. She was president of the National Confederation of Charities and Correction in 1915 and from 1919 to 1937 was president of the National Council of the Church Mission Society. She died in New York city, Nov. 3.

Gliding. Progress in American motorless flight in 1940 continued at a steady pace, slow compared to that of other nations prior to the war, but creditable considering the lack of any government subsidy. The "Golden C," highest international rating, is held by four Americans: Robert Stanley, John Robinson, Chester Decker and Lewin Barringer.

The 11th annual National Soaring contest was held at Elmira, N.Y., in June. There are five annual, regional contests at Arvin, Calif.; Wichita Falls, Tex.; Frankfort, Mich. (in 1940 at Joliet, Ill.); Liberty Corners, N.J. and Wurtsboro, N.Y. Three sailplane factories were established: Bowlus in Los Angeles, Frankfort in Joliet, and Schweizer in Elmira.

Two new records were set: John Robinson, the new American gliding champion, made a national distance record on July 13 by gliding his Ross "Zanonia" 290 miles from Elmira to Richmond, Va. Lewin Barringer, whose book, *Flight Without Power* appeared in June, set a two-seater altitude record of 13,700 feet

TWO GLIDERS collided and their pilots crashed to death at the western championship soaring contest, Arvin, Calif., in 1940

with a Schweizer sailplane on Aug. 19 during an expedition to test conditions at Sun Valley, Idaho. This flight was started by utilizing a "dust devil" or thermal, made visible near the ground by whirling, rising dust, and reached a height of over 20,000 feet above sea level. The flight is expected to be recognized as an international record, the first in America for six years.

(L. B. BA.)

G-Men: *see* FEDERAL BUREAU OF INVESTIGATION.

Goering, Hermann Wilhelm (1893-), German reichsmarshal and statesman, was born at Rosenheim, Bavaria, on Jan. 12 and was commander of the famed Richthofen squadron in the German air force during the World War of 1914-18 after Richthofen's death. Goering was an early member of the Nazi party and became air minister and minister of the interior in 1933 upon Hitler's accession to the chancellorship. *See Encyclopædia Britannica*, vol. 10, p. 532.

Goering was with Hitler at the western front throughout the campaigns of May and June, 1940 and personally directed operations of the *Luftwaffe* against Great Britain. In September he was reported to have flown in a German bomber over London during a raid on the British capital. On July 19, 1940 Hitler conferred the newly-created title of marshal of the Reich on Goering and declared before the Reichstag that his trusted aide, as creator of the German air force, "has individually made the highest contribution to the reconstruction of the German army." Goering, who was appointed head of the economics general staff on Jan. 4, had in 1940 supreme control over Germany's economic life.

Gold. Reacting to the continued open market and increased price, gold production established another new record output in 1939, for the eighth consecutive year. Production is so widely scattered, and figures from many of the smaller and more remote producers are so slow in arriving that in 1940 it was impossible to arrive at an accurate figure for the 1939 total; since the latest production tabulation to arrive listed no less than 90 producing countries, this condition was not surprising. The situation was further complicated by the fact that no statistics were published for the Soviet Union, the second largest producer, so that only estimates for the world total could be presented. As a result, it was becoming customary for statistical agencies to report the total of other production, omitting the Russian output entirely. On this basis, using the latest data available, the world gold output in 1939, excepting the Soviet Union, was 34,500,000

Goldman, Emma (1869–1940), international anarchist, was born in Kovno, Lithuania, on June 1, 1869. Her father was the manager of the subsidized theatre there. Her youth was spent in Koenigsberg and St. Petersburg. When she was 17 years old she went to America and worked in a factory in Rochester, N.Y., and later in New Haven, Conn., where she first became associated with anarchists and espoused their views. In 1889 she went to New York city, where she met Alexander Berkman, who attempted to assassinate Henry C. Frick in Pittsburgh during the Homestead steel strike in 1892.

She resumed the association after Berkman completed a 4 year sentence in prison. She was sent to prison herself in 1895 for inciting a riot. During the World War of 1914–18 she and Berkman were convicted of interfering with war preparations and were sentenced to prison. Both were deported from the United States on Dec. 1, 1919. They went to Russia but disapproved of the soviet regime and travelled to England and thence to Canada. She edited anarchist periodicals and was the author of two books on the U.S.S.R. She died in Toronto, May 14.

Gold Reserves and Gold Standard. The year 1940 did not prove any break in the trend which has seen the use of the gold standard decrease as the gold reserves of the world have increased. By gold the features of the year were (1) an enlargement in the already heavy flow of gold to the United States; (2) a break down in the foreign exchange dealings between the United States and virtually the whole European continent; and (3) a substantial increase in the production of gold.

After having averaged \$1,400,000,000 annually from 1914 through 1937, net gold imports into the United States rose to \$1,974,000,000 in 1938 and then, in 1939, to the record high total of \$3,574,000,000. It did not seem possible that the movement of gold into the United States could exceed the 1939 figure which had resulted from the headlong flight of capital from Europe immediately preceding and immediately subsequent to the outbreak of war. But 1940 was capable of a still mightier effort. There were two main forces which operated in 1940 to enlarge to new record high levels the shipments of gold to the United States. One of these was the desire of Great Britain to transfer the bulk of its gold reserve to the United States for use in paying for the exceptionally large orders for war materials which the British Purchasing commission was placing. The other main drive behind the westward movement of gold across the Atlantic was the abrupt need which the Scandinavian nations, Belgium, the Netherlands and France faced of getting their gold reserves beyond reach of the invading German armies.

Thus there was a dual purpose behind the gold movement from Europe to the United States. The transfer of gold reserves from Europe to the United States for safekeeping purposes found reflection in the increase in the amount of gold under earmark at the Federal Reserve banks from \$1,163,000,000 at the close of 1939 to \$1,815,000,000 as of Nov. 30, 1940. This same influence was mirrored also in the expansion in foreign deposits with the Federal Reserve banks from \$408,000,000 on Dec. 27, 1939, to \$1,153,000,000 on Nov. 27, 1940, the latter the highest total ever attained by these deposits.

oz., an increase of 9% over 1937. The various estimates on the Russian output varied around 5,000,000 oz. This would indicate a world total somewhere near 39,500,000 oz. The production rate continued to expand in 1940 and the total, excepting the soviet union, for the first eight months of the year was 24,105,000 oz., an increase of 7.5% over the same period of 1939, indicating another new record for the year's total.

South Africa continued to hold pre-eminence, with a total of 12,821,500 oz. in 1939 and an increase of 10% in the first ten months of 1940 over the same period of 1939. The lowering of the average grade of ore treated, which dropped from 0.2253 oz. per ton in Jan. 1938 to 0.2051 oz. in Jan. 1939, did not continue in 1939, but rose to 0.2073 oz. in Sept. and was at approximately the same level in July 1940.

Total mine production of recoverable gold in the United States (territories included) was 5,905,052 fine ounces in 1940, an increase of 4% over 5,672,485 ounces in 1939, according to preliminary figures of the Denver office of the bureau of mines, United States department of the interior. The value of the gold calculated at \$35 per fine ounce was \$206,676,820 in 1940 and \$198,536,975 in 1939. Of the total production in 1940, California contributed 24%, Philippine islands 18%, Alaska 13%, South Dakota 10%, Colorado 6%, Nevada 6%, Utah 6%, Arizona 5%, Montana 5% and other states 7%.

Canada in 1939 stood third, with an output of 5,094,000 oz. There was a smaller advance in production rate in 1940, the total for the year being estimated at 5,335,000 oz., an increase of 4.8%. This placed Canada in an intermediate position, third in rank after the United States, including the Philippines, but second ahead of the United States, as compared with it alone.

The position of the soviet union was indefinite since the actual magnitude of the output was a matter of pure conjecture, with opinions varying within wide limits. However, there seemed to be pretty general agreement that the Russian output had been declining since 1935 and it would seem to rank about on a par with United States or Canada.

The only other individual producer having an output in excess of 1,000,000 oz. was Australia, with 1,625,000 oz. in 1939. The Japanese empire had an estimated output of about 1,885,000 oz. in 1939, from Japan proper, Chosen (Korea), and Taiwan (Formosa), an increase of 6.6% over 1938.

The price of gold in London rose steadily from 150s.0½d. on Jan. 2, 1939, to 160s. on September 1. With the outbreak of war with Germany, the price was fixed at 168s. on September 5, and this was maintained to the end of 1940, with dealings in gold prohibited except through official channels, and the requirement that all coin or bullion be sold to the Government. (See also

In the first 11 months of 1940, according to statistics compiled by the department of commerce, gold imports into the United States aggregated \$4,612,000,000, as against \$3,574,000,000 in 1939. The table shows a comparison of the gold receipts for the first 11 months of 1940 and all of 1939.

Gold Receipts of the U.S., 1940 and 1939
(000's omitted)

	1940*	1939		1940*	1939
Canada	\$2,542,111	\$ 613,116	Australia	\$88,783	\$ 74,250
United Kingdom . .	633,000	1,826,403	Portugal	75,030	..
France	241,778	3,798	Netherlands . . .	63,260	347,618

Sweden	161,489	28,716	Italy	43,935	15,719
Spain	98,477	86,291	British India . .	42,543	50,956
Netherlands	90,320	87,955	Norway	33,405	10,953

*Eleven months.

As regards the gold fleeing from Germany's long reach, only part of this gold came directly to the United States from the country of ownership. Much of it had been kept under earmark in London and Paris and appears in the import totals from the United Kingdom and France. Canada was, indeed, the country of the western hemisphere which most of the European gold first reached in its journey to the United States. The usual practice was to send the metal by convoy from British ports to Canada. The important exception to this rule was to be found in the case of the \$241,778,000 of gold reported in the foregoing table as having arrived from France. All of this gold arrived in June and part of it was brought over by a United States warship. In a precedent breaking move, the United States bought this gold in June to keep it from falling into Germany's possession and, there being no other transportation available, brought the gold home in a cruiser stationed in European waters.

This mountainous movement of gold from Europe to the United States stripped Europe more nearly bare of gold than it had been in modern times. Therein lay one explanation for the breakdown in the foreign exchanges. The other explanation was to be found in the measures adopted by the United States treasury following Germany's overrunning of Denmark, Norway, the Netherlands, Belgium, Luxembourg, France and Rumania.

After the invasion of these nations by Germany, and of Latvia, Lithuania and Estonia by soviet Russia, the United States treasury issued a regulation preventing, except by special licence, transfers of property in this country standing to the credit of citizens of the invaded nations. This move was made to ensure against the rightful owners losing their property under duress. The effect of the action was to immobilize upward of \$3,000,000,000 of funds and bring on the suspension of transactions in the currencies of the invaded nations.

In this way the United States, for reasons of public policy, deprived an undetermined amount of gold of its utility. Some gold held in the United States was, in common language, "frozen." Other gold left in the invaded countries was not denied admission to the United States, but the proceeds of the gold were promptly bought under the regulation, if it could be determined that the point of origin of the gold shipment was an invaded nation.

In this way, the United States introduced a new form of discrimination against gold. Gold had been refused in the past among gold standard nations only because further growth in a national gold reserve would be conducive to inflation. In this case, however, gold was in effect robbed of its utility temporarily because the United States declined to recognize it, along with various other forms of dollar assets, as an eligible spoil of war.

The increase in the production of gold was in no small measure attributable to the war. The British empire, as producer of more than half of the newly mined gold in the world outside of soviet Russia, took steps to stimulate the mining of gold so as to build up its store of foreign exchange. In 1939 estimated

world production of gold outside of the U.S.S.R. was \$1,206,000,000, or at a monthly rate of \$100,510,000. In the first nine months of 1940 production of gold averaged approximately \$106,000,000 a month, with the output in South Africa, Rhodesia, West Africa and Canada rising to new high levels. Production of gold in the Belgian Congo was more than doubled to aid in the cause of providing Britain and its allies with more purchasing power abroad. Canadian production, which in 1933 and 1934 had been only about \$100,000,000 a year, was raised beyond the \$200,000,000 mark in 1940.

The increase in the output of gold, together with sales of the metal out of stabilization fund holdings, caused a rise in the acknowledged gold reserves of central banks and governments of the principal nations of the world to a total of \$28,660,000,000 at the end of Oct. 1940, according to estimates of the board of governors of the federal reserve system. This total compared with one of \$25,776,000,000 at the close of 1939 and represented a new record high. Of this \$28,660,000,000 figure, the holdings of the United States accounted for \$21,506,000,000 or 74%. (See also EXCHANGE CONTROL AND EXCHANGE RATES; FINANCIAL REVIEW; GOLD.)

Gold Standard: see GOLD RESERVES AND GOLD STANDARD.

Golf. International competition, specifically the Walker and Curtis cup matches, biennial series in which teams of British and United States amateur men and women golfers compete, were cancelled by the war in Europe.

The United States Ryder cup team, a group of professionals selected in 1939 for the biennial matches with British professionals, had an opportunity to prove their superiority in at least one direction. The team had been considered more or less an honorary one when the war caused cancellation of the matches in Florida, Nov. 1939. Action was assured, however, when Gene Sarazen (who had not been selected for the team, the first time since the Ryder cup came into play) declared he could gather together a team of U.S. professionals capable of defeating the squad selected by the Professional Golfers Association of America.

Walter Hagen, captain of the Ryder cup squad, accepted the challenge, and a series of matches was played in Detroit, Mich. The Hagen team was victorious and the proceeds helped materially in realizing the \$50,000 which the Professional Golfers association turned over to the American Red Cross during 1940.

The only golf activity in Europe consisted of exhibition play by prominent players. Henry Cotton, most famous of England's contemporary linksmen, was reported to have raised £25,000 by his exhibition play.

In the United States the Open championship produced a surprise winner in W. Lawson Little. Twice winner of the British and twice winner of the United States Amateur championships, Little was not even considered among pre-tournament favourites. Little had enjoyed only spasmodic success since joining the professional fraternity in 1937.

Little, incidentally, won the United States Open title in a replay with Gene Sarazen, former United States and British Open victor, whose belated rush almost brought him a third U.S. Open title 18 years after he had won the honour for the first time.

The Open tournament was enlivened by the disqualification of Ed. Oliver, a neophyte professional, playing in the tournament for the first time. Among the first and second round leaders, Oliver, accompanied by John Bulla and E. J. Harrison, started his fourth round before the time prescribed by United States Golf association officials.

The threesome's transgression was discovered before the players had an opportunity to leave the starting tee, but inasmuch as all

three had driven off before the appointed time the United States Golf association wielded its legalistic power and ordered disqualification for the trio. Oliver, however, went on to complete the final 18 holes of the 72 holes championship and scored a 71, which gave him a four-round total of 287. Little already had completed his final round for 287, and later Sarazen came in with a like total.

Both Little and Sarazen petitioned the United States Golf association to permit Oliver to engage in the replay, but officials declared Oliver had not posted a 287 total, inasmuch as he was disqualified before starting the final 18 holes, thus the final round score could not be counted. Little, however, defeated Sarazen rather easily in the playoff.

The disappointments of the tournament were Sam Snead (whose game fell apart on the final round for the second time in two years), Jimmy Demaret and Ben Hogan.

Demaret and Hogan, natives of Texas, had been the sensations of winter tournament golf in the U.S. Demaret had won six Open tournaments, including the Bobby Jones Masters tournament and the Western championship. Hogan, who had been close to victory for several seasons, finally broke through and won three consecutive events with phenomenal scores.

Thus, Hogan and Demaret entered the United States Open championship as co-favourites with Snead. Hogan played well, but not close to expectations, and Demaret, after a discouraging first round, withdrew from the tournament during the second round. Hogan, however, went on to become first among prize winners for 1940, gathering in more than \$10,000 in tournament winnings.

Byron Nelson, 1939 Open champion and runner-up in the National P.G.A. championship to Henry Picard, defeated Snead 1 up in a 36-hole final of the 1940 P.G.A. championship at Hershey, Pa. Nelson scored birdies on two of the last three holes to keep Snead from winning his first major title. Nelson also capped a successful 1940 season by winning first prize of \$2,500 in the Miami (Fla.) Open tournament in December.

Marvin (Bud) Ward of Spokane, Wash., failed to defend successfully his United States Amateur championship at the Winged Foot club, Mamaroneck, N.Y. Ward was defeated in a quarter-finals match by Raymond Billows of Poughkeepsie, N.Y., the player he defeated so soundly in the 1939 finals.

Richard Chapman of Winged Foot, who had played so well in the British Amateur on several occasions, came through to win the U.S. title by defeating W. B. McCullough of Philadelphia, Pa., a "week-end" golfer, 11 and 9 in the finals.

Chapman played sensationally throughout the week, opening his challenge by winning the qualifying medal and coming from behind to overcome a 5 down deficit and defeat Wilford Wehrle, one of the favourites.

Miss Betty Jameson of Texas cemented her niche in women's golf when she successfully defended the United States amateur championship for women. The Texas girl won as convincingly in California as she did the previous year in Connecticut. In winning the title for the second time Miss Jameson defeated Miss Jane Cothran, a South Carolina girl, 6 and 5.

Miss Patty Berg, whose convalescence from an appendectomy prevented her from defending the title in 1939, made herself ineligible for the 1940 championship by accepting an employment offer from a golf equipment manufacturer and thus automatically becoming a professional.

The outstanding performance of the year by any golfer was Craig Wood's 264 for 72 holes in winning the Metropolitan Open championship. The tournament was played at the Forest Hill Field club, N.J., a par 70 course which is on the short side. Three years earlier the Metropolitan Open was played over the same

course and was won by Jimmy Hines with a score of 279.

Wood opened with a six-under-par 64, added a 66, scored a 68 and then finished with a 66 for a mark of even par. This broke the existing record for the Metropolitan Open by 11 strokes. Ben Hogan, whose 275 was three strokes better than the previous record, finished second, 11 strokes behind Wood.

The only international "incident" of the year was the disqualification of Jim Ferrier, Australian, from eligibility for the United States Amateur championship. Ferrier was barred from participation in the tournament because he had compiled a book which the United States Golf association regarded as "instructional," a violation of the amateur code.

Alarmed by the manner in which tournament golfers were putting "backspin" on the ball, the United States Golf association adopted a set of specifications to which manufacturers were directed to conform. The specifications prescribed standard design and width of markings on the faces of iron clubs. Although manufacturers were requested to conform to specifications in all iron clubs manufactured on and after Jan. 1, 1941, the rule will not become operative until Jan. 1, 1942. (T. HU.)

Goma y Tomas, Isidro (1869-1940), Spanish cardinal, was born in La Ribe, Spain, Aug. 17 and was educated at the Metropolitan seminary of Tarragona. He was ordained in 1895 and after serving as a parish priest came professor of profane and ecclesiastical science at the seminary, where he taught for 25 years. He was named bishop of Tarazona in 1927 and archbishop of Toledo in 1931. In 1935 he was made a cardinal by Pope Pius XI. He died in Madrid, Aug. 22.

Goodrich, James Putnam (1864-1940), U.S. state governor, was born near Winchester, Ind., Feb. 18, and was educated at DePauw university. Admitted to the bar in 1886, he practised in Winchester and Indianapolis. He was chairman of the Republican State committee for ten years and for eight years was a member of the executive committee of the Republican National committee. He was governor of Indiana from 1917 to 1921. He died in Winchester, Aug. 15.

Göring, Hermann Wilhelm: see GOERING, HERMANN WILHELM.

Gort, John Standish Surtees Prendergast

Vereker, 6TH VISCOUNT (1886-), British soldier, was born in July 1886, son of the 5th viscount, whom he succeeded in 1902. He was educated at Harrow and Sandhurst, and joined the Grenadier guards as second lieutenant in 1905. In 1908 he was appointed aide-de-camp to the general officer commanding the London district, and at the start of the World War in 1914 he was in the first contingent that went to France. He served throughout the war, sometimes on the staff and then on regimental duty; he was wounded four times, mentioned in dispatches nine times, and received the Victoria cross, the Military cross, and the Distinguished Service Order with two bars. After teaching in the army staff college and the senior officers' school, he went to Shanghai as general staff officer. In 1930 he was appointed commander of the Grenadier guards, and from 1932 to 1936 he was in India as director of military training. He had been promoted major general in Nov. 1935, and in Sept. 1937 he was appointed military secretary to the secretary of state for war, with the

rank of lieutenant general. On Dec. 2, 1937 he was named chief of the British Imperial general staff and on Sept. 3, 1939 commander-in-chief of the British expeditionary forces to France. Viscount Gort remained in France until the evacuation of Dunkirk was almost completed, then returned to London June 1, 1940 in the order of the government. King George commended him for the manner in which he had conducted the Flanders retreat and his withdrawal from Dunkirk and decorated him with the insignia of a Knight of the Grand Cross of the Order of the Bath. On July 19, 1940 he was named inspector general of training forces.

Government Departments and Bureaus.

The following are the leading officers of the more important government departments and bureaus of the United States. The date for the information is Jan. 1941.

Department or Bureau	Name	Post
Department of State	Hull, Cordell	Secretary
Department of the Treasury	Welles, Sumner	Under-Sec'y
Comptroller of the Currency	Morgenthau, Henry, Jr.	Secretary
Treasurer of the U. S.	Bell, Daniel W.	Under-Sec'y
Bureau of Customs	Delano, Preston	Comptroller
Bureau of Internal Revenue	Julian, William A.	Treasurer
Coast Guard	Johnson, W. R.	Commissioner
.	Helvering, Guy T.	Commissioner
.	Waesche, Russell R.,	
.	Rear Adm.	Commandant
.	Stimson, Henry L.	Secretary
.	Patterson, Robert P.	Under-Sec'y
.	Marshall, George C., Gen.	Chief of Staff
.	Adams, E. S., Maj. Gen.	Adj. General
.	Schley, J. L., Maj. Gen.	Chief
.	Arnold, H. H., Maj. Gen.	Chief
.	Jackson, Robert H.	Att'y-Gen.
.	Biddle, Francis J.	Solic. Gen.
.	Hoover, J. Edgar	Director
.	Bennett, James V.	Director
.	(Vacancy)	Commissioner
.	Walker, Frank C.	Post. Gen.
.	Knox, Frank	Secretary
.	Stark, H. R., Adm.	Chief
.	Nimitz, C. W., Rear Adm.	Chief
.	Sexton, W. R., Rear Adm.	Chairman
.	Holcomb, Thomas,	
.	Maj. Gen.	Commandant
.	Ickes, Harold L.	Secretary
.	Wirtz, Alvin J.	Under-Sec'y
.	Johnson, Fred W.	Commissioner
.	Collier, John	Commissioner
.	Mendenhall, W. C.	Director
.	Gabrielson, Ira N.	Director
.	Page, John C.	Commissioner
.	Drury, Newton B.	Director
.	Sayers, R. R.	Director
.	Wickard, Claude R.	Secretary
.	Appleby, Paul H.	Under-Sec'y

Great Britain.—The following were the ministers and chief permanent officials of the more important of the government departments of Great Britain at the close of 1940:

Ministry or Department	Name	Post
Admiralty, The Board of	A. V. Alexander	First Lord
	H. V. Markham	Permanent Secretary
Agriculture and Fisheries	R. S. Hudson	Minister
	Sir Donald Fergusson	Permanent Secretary
Aircraft Production	Lord Beaverbrook	Minister
	A. Rowlands	Permanent Secretary
Air Ministry	Sir Archibald Sinclair	Secretary of State
	Sir Arthur Street	Perm't Under-sec'y
Burma Office	L. S. Amery	Secretary of State
	D. T. Monteith	Deputy Under-Sec'y of State (Acting)
Cabinet Office	Sir Edward Bridges	Secretary
Civil Service Commission	A. P. Waterfield	1st Commissioner
Colonial Office	Lord Lloyd	Secretary of State
	Sir Cosmo Parkinson	Perm't Under-sec'y
Commissioners of Crown Lands	The Minister of Agriculture and Fisheries (<i>ex-officio</i>)	Commissioner
	C. L. Stocks	Perm't Commissioner
Crown Agents for the Colonies	Sir W. Cecil Bottomley	
	H. C. Thornton	
Customs and Excise, Board of	Sir G. Evelyn P. Murray	Chairman
Dominions Office	Lord Cranborne	Secretary of State
	Sir Eric Machtig	Perm't Under-sec'y (Deputy)

Ministry or Department	Name	Post
Duchy of Lancaster	Lord Hankey Sir John Bennett	Chancellor Vice-chancellor
Economic Warfare, Ministry of	Hugh Dalton Sir Frederick Leith-Ross	Minister Director-General
Education, Board of	Herwald Ramsbotham Sir Maurice Holmes	President Permanent Secretary
Food, Ministry of	Lord Woolton Sir Henry L. French	Minister Secretary
Foreign Office	Anthony Eden Sir Robert Vansittart	Secretary of State Chief Diplomatic Adviser
Health, Ministry of	Sir Alexander Cadogan Malcolm MacDonald Sir John Maude	Perm't Under-sec'y Minister Secretary
Home Office and Ministry of Home Security	Herbert Morrison Sir A. Maxwell Sir G. Gater	Secretary of State Perm't Under-sec'y Home Office Secretary, Ministry of Home Security
India Office	L. S. Amery Sir Stuart Kelson Brown	Secretary of State Acting Perm't Under- sec'y
Information, Ministry of	A. Duff Cooper Sir Walter Monckton	Minister Director-General
Inland Revenue, Board of Labour and National Serv- ice, Ministry of	Sir Gerald B. Canny Ernest Bevin Sir T. W. Phillips	Chairman Minister Secretary
Lord Privy Seal	C. R. Attlee	Lord Privy Seal
Mines, Ministry of	D. R. Grenfell Sir Alfred Hurst	Minister Permanent Secretary
Patent Office Paymaster-General's Office	M. F. Lindley Earl Winterton L. Cuthbertson	Comptroller-general Paymaster-general Asst. Paymaster-gen.
Pensions, Ministry of	Sir Walter Womersley Sir Adair Hore	Minister Permanent Secretary
Petroleum, Ministry of	Geoffrey Lloyd Sir Alfred Faulkner	Secretary Perm't Under-sec'y
Post Office	W. S. Morrison Sir Thomas Gardiner	Postmaster-general Director-general
Privy Council Office	Sir John Anderson Sir Rupert B. Howorth	Lord President Clerk of the Council
Public Record Office	The Master of the Rolls C. T. Flower	Keeper of the Records Deputy Keeper
Public Trustee Office	Sir Ernest Fass	Public Trustee
Scottish Office	Ernest Brown Sir Horace P. Hamilton	Secretary of State Under-sec'y of State
Shipping, Ministry of	R. H. Cross Sir Cyril Hurcomb	Minister Director-General
Stationery Office, H.M.	Sir William R. Codling	Controller
Supply, Ministry of	Sir Andrew Duncan Sir William Brown	Minister Permanent Secretary
Trade, Board of	Oliver Lyttleton Sir William Brown	President Permanent Secretary (seconded to Min- istry of Supply)
Transport, Ministry of	Sir Arnold Overton Col. J. T. C. Moore-Brabazon	Second Secretary Minister
Treasury	Sir Leonard Browett Winston Churchill Sir Kingsley Wood Sir Horace Wilson	Permanent Secretary Prime Minister and First Lord Chancellor of the Exchequer Permanent Secretary and Head of H.M. Civil Service
War Office	Capt. David Margesson Sir James Grigg	Secretary of State Perm't Under-sec'y
Works and Public Build- ings	Lord Reith Sir Patrick Duff	Minister Secretary

Government Expenditures: see BUDGETS, NATIONAL; TAXATION.

Government Printing Office. The office was established in 1860 to execute printing and binding for the executive and judicial departments and the court of claims. Its functions extend to all branches of the government and include the sale of official publications, reports and technical bulletins. Many of its publications are printed in foreign languages and find circulation in other countries. The total area occupied by the government printing office in 1940 was 1,396,973 sq.ft. or 33 acres. The value of the buildings was \$9,634,825; machinery and equipment \$5,865,933, making the total value of the plant \$15,500,758. At the end of the fiscal year 1940 there were 6,059 employees

on the rolls with a pay roll of approximately \$12,963,771. The office produced a total of 155,046,098 publications of all classes. This total included 7,876,562 copies of the *Congressional Record*; 5,815,470 copies of specifications of patents, trademarks, designs, etc.; and 241,432 copies of the *Official Patent Office Gazette* and annual indexes. Postal cards delivered amounted to 2,261,336,000; money orders delivered, 267,767,825; and the stock division handled approximately 2,735 carloads of paper. During the fiscal year 1940 the division of public documents mailed 702,160,053 publications and forms; its receipts from the sale of government publications during the year amounted to \$1,111,050.54. The total value of all printing done was \$20,085,183.

(A. E. GL.)

Granite: see MARBLE AND GRANITE.

Grapefruit. Production of grapefruit in the United States in the 1940-41 season was estimated by the department of agriculture as 40,364,000 boxes, compared with 34,975,000 in 1939-40 and 43,594,000 in 1938-39. Florida crop increased 32% and Texas 6% while in California and Arizona combined the 1940-41 production was about 10% below the preceding season. Production by states in 1940, in 1939 and in the ten-year (1929-38) average is shown in Table I.

Table I.—Grapefruit Production by States, 1940, 1939 and 10-Year Average

	1940 Boxes*	1939 Boxes*	1929-38 Boxes*
Florida			
All varieties	21,000,000	15,900,000	14,037,000
Seedless	7,200,000	6,500,000	15,033,000
Other varieties	13,800,000	9,400,000	110,533,000
Texas	15,000,000	14,200,000	5,020,000
Arizona	2,570,000	2,900,000	1,252,000
California	1,794,000	1,975,000	1,640,000

* Net content of boxes in California and Arizona averages approximately 60 lb. in Florida and Texas, 80 lb. † Short time average.

War severely damaged the new grapefruit industry of Palestine which had become an important competitor for European markets. Shipments of grapefruit from Palestine from Nov. 1939 to June 1940 were 987,000 boxes compared with 2,067,000 boxes in the preceding season. Lack of shipping facilities and markets closed by blockade caused the decline.

Table II.—Grapefruit Production in Certain Countries, 1940-41 and 1939-40

	1940-41 Boxes	1939-40 Boxes
Jamaica	100,000	185,000
British Honduras	100,000	125,000
Honduras	90,000	80,000
Cuba	225,000	200,000

Relief loans, subject to government guarantees, to grapefruit growers were authorized to be advanced by the four principal banks in Palestine to a maximum of about \$2,000,000, or estimated \$32 per acre. Table II shows other commercial production in the 1940-41 and the 1939-40 seasons as reported by the Office of Foreign Agricultural Relations, United States department of agriculture. (S. O. R.)

Grapes. Production of grapes in the U.S. in 1940 was estimated Nov. 1 by the department of agriculture at 2,577,110 tons. The 1939 crop was 2,525,830 tons, and the ten-year (1929-38) average 2,220,001 tons. Raisin-type grapes in 1940 were estimated at 1,249,000 tons as against 1,269,000 tons in 1939 and a ten-year average of 1,126,500 tons. In California

Production of Grapes by States, 1940 and 1939

State	1940 tons	1939 tons	State	1940 tons	1939 tons
California	2,281,000	2,228,000	Georgia	2,080	1,830
New York	75,800	75,600	South Carolina	1,090	2,020
Michigan	50,900	58,100	West Virginia	1,010	1,750
Ohio	37,500	42,800	Tennessee	1,780	2,240
Pennsylvania	23,000	23,200	Alabama	1,380	1,710
Missouri	10,900	12,500	New Mexico	1,270	1,170
Kansas	9,600	8,200	Utah	860	840
North Carolina	8,500	7,500	Florida	830	670
Illinois	8,100	8,800	Massachusetts	780	700
Washington	6,500	5,700	Colorado	770	500
Idaho	6,300	5,800	Arizona	740	710
Nebraska	6,000	4,100	Maryland	720	750
Illiana	4,000	4,800	Idaho	580	580
New Jersey	3,000	3,100	Wisconsin	490	490
Braska	3,800	3,000	Minnesota	300	290
Oklahoma	3,600	3,200	Rhode Island	280	230
Texas	3,000	2,800	Mississippi	220	290
Virginia	2,800	2,600	New Hampshire	120	110
Kentucky	2,790	2,750	Nevada	110	110
Connecticut	2,770	2,460	Louisiana	60	50
Delagon	2,300	1,700	Vermont	50	50
Delaware	2,100	2,000	Maine	30	30

1940 estimate for wine grapes was 608,000 tons compared to 500,000 tons in 1939 and a ten-year average of 481,800 tons. The grapes in California were estimated at 424,000 tons compared to 390,000 tons in 1939 and a ten-year average of 342,400 tons. About 10% of the Concords, the principal variety in New York, were damaged by hard freezes Oct. 19 and 20 in the Putauqua-Erie belt, and about 80% of the minor Catawba variety in the Finger Lakes region. The table shows production of grapes by states in 1940 and 1939. (S. O. R.)

Graphite. Exports of graphite from Chosen in 1939 increased 14% over 1938, to 57,700 metric tons; Mexico stood at 8,200 tons, while Ceylon rose to a record figure of 22,800 tons; figures are lacking for Madagascar (13,400 tons in 1938) and for Germany, but on the basis of past outputs, including Austria and Czechoslovakia, that country has a potential output of 45,000–50,000 tons. Producers of less importance include Canada, India, Italy, Japan and Norway. Production in the United States almost ceased. It is important to note that with the annexation of Austria and Czechoslovakia, Germany became at the same time the largest producer of graphite and the only consumer of importance with a surplus supply from domestic sources; all other consuming countries are dependent on imports from most or all of their supply of graphite. (G. A. Ro.)

Gravel: see SAND AND GRAVEL.

Graves, William Sidney (1865–1940), U.S. major general, was born in Mt. Calm, Texas, March 27. He was graduated from the United States Military Academy in 1889 and rose through various grades to the rank of major general on July 11, 1925. He served in the Philippines in the early days of the U.S. occupation. In 1918 he was put in command of the American expeditionary force in Siberia and for two years was in command of the American base at Vladivostok. He received the Distinguished Service medal in congress and was decorated by Japan, China, Czechoslovakia and Italy. He died in Shrewsbury, N.J., Feb. 27.

Graziani, Rodolfo, MARCHESE DI NECELLI (1882–), Italian soldier, was born Aug. 11 at Nettuno. Selecting the army for his career, he served in Eritrea from 1908 to 1913 and in Libya prior to Italy's entry into the World War of 1914–18. In the campaigns against Austria he was commander of an infantry brigade and by Oct. 1918 had advanced to colonel. Afterward he commanded a brigade in Macedonia and during his service in Tripolitania (1921–29) was promoted to general of a division. From 1930 to 1934 he commanded the Italian forces in Libya and in 1935 and 1936 he directed the

southern attack against Haile Selassie's forces in Abyssinia. He became known as Italy's greatest colonial soldier and second in fame only to Marshal Badoglio (*q.v.*).

Upon Italy's declaration of war June 10, 1940, Graziani was confirmed as chief of the army staff. After the death of Italo Balbo (*q.v.*) he was appointed governor general of Libya. As commander of Italy's North African forces he directed the Italian invasion of Egypt which began Sept. 12. After capturing Sidi Barrani Sept. 16 Graziani's offensive bogged down; it was thrown into full reverse by the British drive launched Dec. 9. In a report to Mussolini on Dec. 22 Graziani attributed the Italian defeat to lack of adequate mechanized equipment.

Great Britain & Northern Ireland, United Kingdom of.

This comprises the main island of Great Britain, with numerous smaller islands off the English and Scottish coasts, and the six north-eastern counties of Ireland. It is a constitutional monarchy, with a king and a parliament of two houses, the house of lords consisting of about 670 hereditary peers, 24 spiritual peers, 16 Scottish representative peers, a number of Irish representative peers (in 1940, 14; vacancies are no longer filled) and a few life peers who have held high judicial office; and house of commons, numbering 615 members, elected by a practically universal suffrage. Flag, the Union Jack, consisting of a red cross on a white field (for England), surcharged on a diagonal red cross on a white field (for Ireland), surcharged in turn on a diagonal white cross on a blue field (for Scotland). Ruler: King George VI; premier: Rt. Hon. Winston S. Churchill, C.H.; religion: chiefly Protestant Episcopal Church.

Area and Population.—Area 93,991 sq.mi.; pop. (est. June 30, 1939) 47,680,500 (England and Wales 41,375,000). Chief towns (pop. est. June 30, 1938): London (cap.), city and metropolitan police districts, 8,700,000; city and metropolitan boroughs only, 4,062,800; Glasgow (June 30, 1939), 1,131,500; Birmingham, 1,041,000; Manchester (including Salford), 932,300; Liverpool, 827,400; Sheffield, 520,000; Leeds, 494,000; Edinburgh (June 30, 1939), 473,200; Belfast (Jan. 1, 1939), 443,500; Bristol, 415,000; Hull, 318,700.

History.—The history of the United Kingdom during the year 1940 is neither more nor less than the history of its war experience—not exactly the history of the war itself, which is told in greater detail in other articles, but the history of the impact of the war, phase by phase, on the history of the governments and peoples at home. That history may be regarded from several different angles. One may regard it as a crescendo of urgency and effort, with a sudden jerk forward on May 10, when two decisive events occurred simultaneously but independently of one another, the German invasion of Holland and Belgium and Winston Churchill's accession to office as prime minister. One may regard it as a descent, punctuated by a series of reverses of increasing magnitude, into the gulf of peril, followed by an emergence, not out of peril perhaps but into full confidence based on brilliant achievement. Lastly, one may regard it as a series of phases, each peculiarly distinct, sometimes following directly upon one another, sometimes separated by pauses, but hardly at all overlapping. The first phase, begun in Nov. 1939, was one in which the main preoccupation was a war in which the British were not technically engaged at all, the attack of Russia on Finland. It ended with the Russo-Finnish peace treaty of March 12, 1940. Four weeks passed, and the second phase opened with the German assault on the two northern neutral states of Denmark and Norway on April 9. This phase ended in essentials with the withdrawal of British and French troops from the

INTEREST RATHER THAN FEAR is exhibited by these English children who took shelter in a ditch during a German air raid of 1940

neighbourhood of Trondhjem in the first week of May. The third phase opened on May 10 with the German invasion of Holland and Belgium and ended with the withdrawal of the greater

part of the British expeditionary force from Dunkirk in the four days of June. The fourth phase opened on June 5 with the German attack on the French armies from Abbeville to the northern end of the Maginot line and ended on June 16-17 with the fall of M. Reynaud's French government and the capitulation of France. During this phase Italy had joined Germany and its ally saw Britain standing virtually alone. The fifth phase, the so-called battle of Britain, did not enter an acute stage until the large-scale German air raids began on Aug. 8, the 22nd anniversary of what Ludendorff had called "the black day of the war in Germany," the British attack in front of Amiens on Aug. 8, 1918. This culminated in the tremendous air battle of Sept. 15 during which, it is said, an overseas invasion was actually launched. A long series of aimlessly destructive night bombings followed and constituted a sixth phase. This continued to the end of the year and both fifth and sixth phases were, of course, coincident in time with British bombing of every kind of genuine military objective in enemy-occupied territory. The seventh and last phase opened with the abortive Italian attack on Greece at the end of October, intensified by the brilliant British assault on the Italian army in Libya, which began on Dec. 9.

These seven phases will be reviewed in turn, but it will be convenient first to mention certain incidents which do not fall within any of them. The chief occupation of the German air force during the first eight months of the war, the period of *sitzkrieg*, or *sitz* warfare, was to attack British and neutral shipping, either directly or by laying mines. The counteractivity of the British air force was to watch over the enemy seaplane bases, and to attack the enemy as they sallied forth. For a long time the forces of both sides were under instructions to refrain from dropping bombs on enemy territory. But on Jan. 9-10 the British bombed the enemy seaplane base at Sylt, just south of the Danish frontier, and on March 19-20, three days after a German air raid on Scapa Flow which entailed the first British civilian casualties, the British air force subjected Sylt to a much heavier bombardment lasting six hours.

On Jan. 16 the admiralty announced the loss of three marines, the first sunk by enemy action during the war. On Jan. 17 the German vessel "Altmark," with over 300 seamen on board from vessels sunk by the "Graf Spee" (destroyed off Montevideo in the previous December), was boarded and captured after hand-to-hand fighting by the British destroyer "Cossack." This incident took place in a Norwegian fjord, and led to a protest from the Norwegian government against a breach of her neutral rights. The effective answer was given that Norway had herself neglected her duty as a neutral by allowing the "Altmark" to proceed without examination through her territorial waters.

On Jan. 8 rationing for bacon and ham, butter and sugar, came into force, followed by meat rationing on March 11. The ration, supplemented by unrationed foods, allow an ample diet, and it can be said without exaggeration that the handling of coupons was the only hardship involved.

The Problem of Finland.—British opinion recognized, almost without exception, that Finland, in her heroic resistance to Russian aggression, was morally an ally in that her cause was the defence of freedom, but the problem of rendering her effective assistance was beset with difficulties. Whatever the British might think of Russia's action they were not anxious to add her to the list of their active enemies; whatever help they might send to Finland must not be allowed to subtract seriously from their own vital requirements for defence against an attack which might come at any moment; and further, whatever help the British might, in spite of these considerations, decide to send would have to get through two serious obstacles, the obstacle imposed by geography and the obstacle of Scandinavian neutrality. The

made known by the prime minister, Neville Chamberlain, the debate that followed the end of the Finnish resistance. The requests for military equipment of all kinds were very fully met—on paper. But delays, avoidable and unavoidable, such that much, though released in Britain, did not reach General Mannerheim in time for use. As regards direct support of troops, Mannerheim asked that 30,000 trained men should arrive in Finland by May, and the British and French governments undertook to fulfil this request and did in fact equip an expeditionary force of these dimensions. But Finland was compelled to negotiate before the opposition of Norway and Sweden to the transport of the force across their territories had been overcome. It could be maintained that, under the covenant of the League of Nations, Norway and Sweden were under an obligation to assist Finland, passively if not actively, against what the league had officially proclaimed to be aggression; but Hitler spoke louder than the league. Whatever their duties or their sympathies they were afraid to afford an excuse for a German invasion.

The Problem of Norway.—Americans were inclined to speak of the war at this stage as a "phony" war. Sea warfare, indeed, was taking much the same form as in 1914-18; but air warfare was very limited to co-operation with sea warfare, and the warfare on land, which to the layman always seems the main activity, was practically nonexistent. There remained economic warfare, or blockade. Blockade had played a very large part in the defeat of Germany in 1918, and it was hoped that in respect history would repeat itself. One of the commodities which a decisive shortage might be created by blockade was iron. Germany had an important source of external supply in the north of northern Sweden, which travelled by rail to Narvik in northern Norway and thence down the "accursed corridor" of Norwegian territorial waters. After long hesitation the Allies on April 8 laid a minefield in these territorial waters which would drive the ships out into the open sea and put them at the mercy of British sea power. On the next day Germany occupied Denmark and invaded Norway. There was a flimsy pretence that this was a "reply" to the Allied breach of Norwegian neutral rights, but really the undertaking, which was based on typically elaborate and well thought out plans, had not only been prepared long before, but had actually been set in motion the day before, not the day after, the laying of the minefield. Norwegian treachery on a large scale co-operated by arrangement with the German invaders. The main line of invasion was through Oslo, which was handed over to the invaders almost without a blow, but the Atlantic ports of Bergen and Trondhjem and Narvik and all the main airbases were seized by small forces smuggled into Norway in commercial vessels or by troops landed from troop-carrying planes.

The royal navy responded immediately with the two battles of Narvik on April 10 and 13. In the first of these battles four German destroyers and seven other vessels were destroyed by a much weaker British force—one of the most glorious achievements in the records of the royal navy. But the decisive theatre was much farther south. Could the Allies, taking into account the difficulties involved, their lack of Norwegian air bases, and the risk of depleting their forces elsewhere against an enemy still stronger than themselves in fighting power everywhere except at sea, land at Trondhjem or elsewhere an expeditionary force sufficient to defeat the Germans and drive them out of Norway, or pin them down in some small corner of it? From April 15 onward small Allied forces were landed at Andalsnes and Namsos, on the northern side of Trondhjem, but the Germans advanced from the south in overwhelming force; British fighter planes could not, from their distant British bases, combat the German bombers; the sea

air arm was insufficient for the purpose; and in the first week of May the British troops were withdrawn.

The Change of Government.—This failure was the occasion of the historic debate in the house of commons of May 7 and 8. Beginning as an attack on the conduct of the Norwegian operations it broadened out into an impeachment of the government for the whole of its conduct and attitude towards the war during the first eight months, in which many speakers outside the official "opposition" joined. A division was demanded in which 44 normal supporters of the government voted against it and many more refrained from voting. The government majority of 80 was morally a defeat; on May 10 Mr. Chamberlain resigned and Mr. Churchill became prime minister.

If the ground of the division had really been a conflict of opinion about the strategy pursued in Norway during the previous month, the accession to office of Mr. Churchill would have been quite illogical since, as first lord of the admiralty, he was as much responsible as any man for that strategy. But it was not so. Those who voted against the government did so because they held that it had proved its inadequacy all along the line, and there was no question that those who held this view regarded a really national "all-in" and "all-out-to-win" government under Mr. Churchill as the only satisfactory alternative. Mr. Churchill came into power with many assets in his favour. For one thing he had no association with Munich and the discredit and failure of the "appeasement" policy; from the first he had realized the

OVER CHURCH shelled in 1940 by German guns across the English channel

UNPERTURBED CITIZENS fished as usual in the Thames during the midsummer of 1940

menace of Hitler, and had pressed the claims of rearmament on a reluctant and incredulous parliament and people. Secondly, he was, apart from Lloyd George, now nearly 80 years old, the only living British statesman who was held to have proved himself a first rate war minister in 1914-18. Thirdly, and most important in these days of wireless, he had, like Hitler, and unlike Mr. Chamberlain, oratorical powers of the very highest order. And lastly, he secured, as Mr. Chamberlain had failed to do, the active co-operation within his government of all political parties. The Labour leaders, Mr. Attlee and Mr. Greenwood, joined Mr. Churchill as ministers without portfolio in his new war cabinet, and big men outside politics, Mr. Bevin, a trade union leader, and Lord Beaverbrook, a proprietor of popular newspapers, took two key posts as ministers of labour and of aircraft production. Nothing that happened in the ensuing eight months impaired the confidence with which Mr. Churchill's government was from the first regarded.

The Meuse and Dunkirk.—On May 10, the day Mr. Churchill took office, German armies invaded Holland and Belgium. The Dutch invasion was accompanied by pre-organized treason of civilian elements in Holland, many of them Germans who had entered the country during recent months, by the dropping of parachutists who seized aerodromes and took the Dutch armies in the rear, and by a ferocious air bombardment of Rotterdam. On May 14 the Dutch laid down their arms. In Belgium, German armies made their way through the Ardennes with remarkable speed and efficiency to the Meuse sector of the French frontier, which was defended by weak, inefficient and possibly treacherous French forces. Between May 16 and 20 they had broken right through with a powerful mechanized force, the French having made what the premier, Reynaud, described as "incredible mistakes." By May 26 the Germans were in occupation of Amiens and Boulogne. The British army of 365,000 men, together with part of the French army and the Belgian army, was entirely cut off from the main body of the French armies, and was being driven back upon a narrow strip of coast. On May 28 the king of the Belgians ordered his army to lay down its arms. It looked as if practically the whole of the British army might be compelled to surrender. Actually 330,000 men were safely evacuated, during the first four days of June, from the beaches of Dunkirk in "one of the most difficult operations of war ever undertaken." It was a triumph of co-operation between army, navy and air

force. But the whole equipment of the B.E.F. had to be left in enemy hands.

During this crisis the force first known as the local defence volunteers and afterwards as the home guard was formed and grew in the next few months to 1,500,000. At the same time enemy aliens were interned. Hitherto the British government had pursued an extraordinarily generous and trustful policy towards such persons. But now no risks could be run. The policy of wholesale internment, executed in haste, involved inevitable injustice to individuals of proven loyalty; such injustices have since been in large measure remedied by a policy of what may be called "retail" release. At the same time a number of British fascists and other possible "Quislings" (the name of a notably pro-German Norwegian) were imprisoned.

The Collapse of France.—On June 5, the day after the completion of the evacuation at Dunkirk, the "battle of France" began. The Germans attacked all along the Somme and the Aisne, and from the start the French armies as a whole offered only feeble resistance. They were outclassed in every department. Italy declared war on June 10. Paris fell on June 14. The Reynaud government was overthrown on June 16, and on June 17 the Pétain government, violating the terms of the Anglo-French alliance, asked for peace terms. On June 18 General de Gaulle, Reynaud's military adviser, having arrived in London, issued his call to Frenchmen to continue the fight for their country and empire. The Franco-German armistice, involving terms of absolute surrender, was signed on June 22.

Comparatively small British forces had been engaged in the "battle of France." They were evacuated, not without serious loss, from ports in the west of France. On June 28 the Channel islands were demilitarized and a considerable part of their population evacuated. The downfall of France appeared almost incredible to the world in general, but less so to students of recent French history. There had been for some years past a not very unequal balance between the forces of patriotism and freedom and the forces of *défaitisme* and pro-Germanism in that country.

French reluctance at the outbreak of war had delayed the Anglo-French ultimatums from Sept. 1 (the day of the invasion of Poland) to Sept. 3. Still, so long as all seemed well, the forces of *défaitisme* were kept under and well out of sight. The shock of defeat tilted the balance in their favour and brought them to the surface.

The defeat of France had a grim aftermath. The armistice terms involved the surrender to German control of the whole of the French navy. This could not be allowed, though the British government was prepared to accept any reasonable alternative, such as the internment of French ships of war in American waters. At Oran on the Algerian coast on July 3 the French admiral refused the conditions offered by the British government whereupon a British squadron opened fire and destroyed or disabled the greater part of this French fleet. Elsewhere French ships were either disabled, or interned by agreement, or voluntarily handed over to British control. But many destroyers and minor craft passed into German hands.

The Battle of Britain.—If the "battle of Britain" had followed as closely on the "battle of France" as that had followed on the "battle of Flanders" no surprise would have been felt. There was widespread raiding by small parties of German bombers of all parts of Great Britain in the last fortnight of June and throughout July, but these could be regarded as no more than practice flights and rehearsals. Hitler was said to have fixed the date for the capitulation of Britain as Aug. 15, which in the Catholic church is "the Feast of the Assumption," but for a long time nothing happened to suggest any attempt to keep true to his timetable. At last on Aug. 8 German air raids *en masse* began. A

fare lends itself more to statistical treatment than other ms of warfare, and statistics will be found elsewhere in this ume. On the heaviest day of the August fighting, the 15th, the rmans lost 180 machines, only surpassed by the air battle of ot. 15 when at least 185 German planes were brought down, and ording to an unofficial estimate, nearly 250. Throughout, the rmans lost more than three times as many machines and more n six times as many men as their opponents. But the main ult was not statistical. The Germans decisively failed to ieve mastery of the air by daylight raids over the British st. Thereafter Hitler abandoned, for 1940, all serious attempt conquer Britain by "air-blitz" and invasion, concentrating inad on night raids designed to destroy life and property. These most heavily on London, but also on a number of provincial ns such as Coventry, Southampton, Bristol, Birmingham, nchester and Liverpool. These raids tested severely the courage the people and the efficiency of the A.R.P. services but served military purpose. The casualties of civilians in the last four nths of the year were much heavier than those of all the tish fighting services in all theatres of war during the same od. On one of the last nights of the year enemy bombers royed by fire a number of the historic buildings of the City of don, including Guildhall. Meanwhile the R.A.F. were nightly aged in raids on military objectives ranging from the French ts to Berlin. (See also AIR FORCES.)

The Mediterranean.—The entry of Italy made the Mediter-ean likely to become a main theatre of war. The enemy might k, with or without Spanish co-operation, to secure control of alrtar, and, at the other end, to attack the Suez canal through Balkan countries, or French Syria, left derelict by the colse of France. The Italian fleet was, until half of it was troyed by air attack in Taranto harbour on Nov. 11, much erior "on paper" to the British Mediterranean fleet, and aziani's army in Libya enjoyed a similar and more decisive eriority over Gen. Wavell's army in Egypt. But enemy of- sive in these regions seemed to hang fire except that Hitler re or less annexed Rumania (Oct.) with disastrous results at that country.

However, on Oct. 28 Mussolini, with or without German ap- val, made an attack on Greece from Albania, which he had acherously occupied 18 months before. The result was, with- exception, the greatest surprise of the war up to date. The ces of this so-called "great power," heirs of the Roman em- e, showed themselves inferior at all points to the Greeks, and the end of the year were being driven back on Valona, their in port of embarkation.

British assistance to the Greeks delayed the execution of their a plans in Libya until December. The attack was opened on c. 9, and two days later the Italian advanced base of Sidi rrani was enveloped and secured, with 30,000 prisoners and nense quantities of stores. The victory was the result of bril- ant co-operation of army, navy and air force. By the end of year a similar fate seemed in store for Bardia, further west the same coast: it in fact fell on Jan. 5, 1941. No blow ext from the air had yet been struck at Germany, but her rtner was already badly mauled.

Shipping Losses.—In the latter months of the year shipping ses due to enemy action mounted in many weeks to un- asantly high figures, though never approaching those of the rst months of 1917. The abandonment of the naval bases in stern Ireland, surrendered in 1938 as part of a futile effort to "opease" de Valera, was deplored, but the exchange of 50 Ameri- a destroyers for the lease to America of naval bases in the est Indies and elsewhere did something to redress the balance. ly a really big increase in destroyer strength could give se-

curity to all convoys on all seas.

(D. C. So.)

Education.—In 1937-38: elementary, England and Wales, de- partments under separate head teachers 29,988, scholars on regis- ter 5,150,874; elementary, Scotland—schools 2,895, scholars 617,- 047; elementary, Northern Ireland—schools 1,700, scholars 191,- 862; secondary, England and Wales, grant-aided schools 1,398, scholars 470,003; secondary, Scotland—grant-aided schools 252, scholars 156,645; secondary, Northern Ireland—grant-aided schools 75, scholars 14,557; universities, students: England 41,707 (full time, 36,378); Wales 3,089 (full time, 2,970); Scotland 10,- 384 (full time, 9,841); Northern Ireland 1,590 full time students.

Banking and Finance.—Revenue, ordinary (actual 1939-40) £1,049,189,000; expenditure, ordinary (actual 1939-40) £1,816,- 873,000; public debt (national) March 31, 1940, £8,931,000,000. (See BANK OF ENGLAND.)

Table I.
ESTIMATED REVENUE 1940-41

	£	£
Income Tax	450,500,000	
Surtax	75,000,000	
Estate Duties	85,100,000	
Stamps	10,000,000	
National Defence Contribution and Excess Profits Tax	70,000,000

*Substantive cost in 1940 to be met from votes of credit.

Trade and Communications.—Overseas trade in million £: imports, merchandise (1938), 920; (1939) 885.9; exports, do- mestic (1938), 470.8; (1939) 438.8; re-exports (1938) 61.6; (1939) 45.9; bullion and specie, net exports (1938) 73.9.

Table II.—Overseas Trade, Showing the Variations in the First Eight Months (Jan. 1-Aug. 31) of Each of the Years 1937-40 (in million £)

	1937	1938	1939	1940
Imports	654.4	616.5	605.9	792.9
Exports	341.4	306.9	313.6	312.6
Re-exports	54.2	42.4	36.3	22.6
Total Exports	395.6	349.3	349.9	335.2

Communications: roads (March 31, 1938): England and Wales, (class I) 20,627 mi.; (class II) 13,070 mi.; Scotland (class I) 6,632 mi.; (class II) 3,967 mi.; Northern Ireland (class I) 1,273 mi.; (class II) 1,933 mi. Railways (Dec. 31, 1938): Great Britain, track open to traffic, excluding sidings, 20,007 mi.; Northern Ireland, standard gauge, 633 mi.; narrow

gauge 121 mi. Airways (1938¹): distance flown 14,331,000 mi.; passengers carried 222,200; mail carried 3,453 tons; freight carried 2,527 tons. Empire services (airways), traffic ton miles including passenger ton miles (1937-38) 7,153,767; (1938-39) 13,734,899; passengers carried (1939) 12,614. Shipping, excluding vessels under 100 tons (July 1, 1939), 17,984,158 gross tons; under construction (July 1, 1939) 791,500 gross tons; shipping (net tonnage with cargo), entered (monthly average 1938) 5,698,000; cleared (monthly average 1938) 4,907,000; entered (Aug. 1939) 6,617,000; cleared (Aug. 1939) 5,525,000. Motor vehicles licensed (Sept. 30, 1938): cars 1,944,394; hackney vehicles (taxis, buses, coaches, etc.) 87,730; commercial vehicles 590,397; motor cycles 462,375; total 3,084,896. Wireless receiving set licences (Sept. 30, 1939), 9,085,050; telephones (Dec. 31, 1939): number of stations (including public and private lines, call boxes, etc.), 3,235,500.

Agriculture, Manufactures, Mineral Production:—Production in 1938: (in metric tons) wheat 1,996,200; oats 2,023,700; barley 918,800; potatoes 5,197,100; beet sugar 294,200; hops 131,000; coal 231,875,000; iron ore (metal content) 3,615,000; pig iron and ferro-alloys 6,871,000; steel 10,561,000; sea fisheries (wet fish only) 1,062,665; whale oil 221,100; benzol 218,800; shale oil 132,000; beef and veal (1937-38) 688,000; pig meat (1937-38) 415,200; mutton and lamb (1937-38) 257,000; wool 50,300; wood pulp 270,000; silk, artificial 48,285; margarine 211,600; butter (1937) 46,700; cheese 44,400; flax (fibre) (Northern Ireland) 4,100; rye 10,900; lead ore (metal content, 1937) 26,800; aluminium (smelter production) 23,000; super-phosphates of lime (1937) 449,000.

Table III.—Agricultural Production, in Thousands of Metric Tons,* and Acreage England and Wales, 1938 and 1939.

Crops	1938		1939	
	Thous. met. tons	Acres	Thous. met. tons	Acres
Wheat	1,853	1,830,261	1,555	1,682,616
Barley	803	885,499	794	910,073
Oats	1,060	1,300,530	1,110	1,358,008
Mixed Corn	74	92,240	72	82,781
Seeds hay	1,281	1,184,082	1,700	1,302,858
Meadow hay	3,131	4,229,308	4,535	4,611,564
Beans (for stock-feeding or seed)	106	129,817	109	132,968
Peas (for stock-feeding or seed)	30	38,153	23	36,800
Potatoes	3,486	474,786	3,312	453,976
Turnips and Swedes	5,081	421,190	4,047	394,249
Mangolds	3,599	212,531	3,938	208,891

*One metric ton = .98421 English ton.

Industry and Labour.—Index of industrial production (1929=100) av. (1938) 115.5; av. (Jan.-June 1939) 123.1; index of employment (1929=100) av. (1938) 111.0; av. (Jan.-June 1939) 113.5. Industrial population, insured (July 1939) 14,838,000; unemployed, wholly, av. (1938) 1,423,662 (10.3%); temporary, av. (1938) 378,918 (2.8%); wholly (Aug. 12, 1940) 613,156 (4.1%); temporary (Aug. 12, 1940) 154,380 (1.04%).

Greece. A kingdom in the Balkans, with an area of 50,147 sq. mi. and a population estimated at 7,150,000, was ruled in 1940 by King George II, but the real power was concentrated in the hands of General John Metaxas, who had made himself dictator of Greece on Aug. 4, 1936, and who had also assumed in addition to the premiership the portfolios of foreign affairs, war, navy, air and education. General Metaxas had abolished parliamentary democracy in Greece and introduced fascist principles as the basis of political and cultural life. At the same

PROGRESS of Greek-Italian hostilities in Albania to Dec. 31, 1940

time, he had taken great care to modernize the Greek army also to introduce progressive social legislation. In the education of the youth, the Spartan tradition was more stressed than Athenian, and the birth of a new, third Hellas was proclaimed. The events of 1940 revealed clearly that the government General Metaxas had achieved at least one of his aims, that military preparedness.

In her foreign policy Greece found herself at the beginning of 1940 supported by a British and French pledge, given in April 1939, to aid Greece should her independence be threatened. The promise had been given in view of the danger to Greece implied in the Italian occupation of Albania in April 1939, which had caused much uneasiness in Greece. Later on this uneasiness lessened in view of Italy's repeated declarations of non-aggression and peaceful intentions. Greece, a member state of the Balkan Entente, found herself in especially close relations with Turkey. Both states followed the same policy of a strong determination to defend their independence against any aggression and of relying upon the help of Great Britain in case of such aggression.

The situation changed after the entrance of Italy into the war and after the failure of fascist expectations to defeat Great Britain in the early summer of 1940. As the war dragged on and as the power of resistance in the British Isles grew, the Italian powers drew up plans for a blow against Great Britain in the eastern Mediterranean. For that purpose, they wished to occupy Greece, and perhaps Turkey, so as to secure the control of the eastern Mediterranean. In preparation for such a step, the Italian press launched a violent campaign against the Greeks in April 1940, accusing them of maltreating the Albanian minority in Epirus, a part of northwestern Greece bordering on Albania, the capital of Yannina. The Greeks, however, were not intimidated. Though they stressed their determination to cling to their neutrality, they made it clear that they would resist any invasion of their territory. In the early months of the autumn the Greek army was put on a partial footing of mobilization. The Greek army is rather small, its effective strength in 1938 being 10,000 officers and 65,000 men. But in view of the compulsory military service which begins in the 21st and lasts up to the 50th birthday, the army is much larger if fully mobilized. The equipment of the army has lately been modernized, although it was in 1940

¹At the outbreak of war all empire services were suspended with the exception of weekly return flights to Kisumu and Durban. In April 1940 a London-Lisbon air line was inaugurated, and in June a Durban-Sydney route (via Tanganyika, Egypt, Palestine, Iran, India, Burma and the Dutch East Indies), connecting with the service from Sydney to Auckland, N.Z.

good when compared with modern requirements. The guns were largely of French or German make. The air force was estimated in 1938 as consisting of ten groups, each of three flights, each flight having four aircraft. The Greek army made up, however, for its technical deficiencies by its excellent spirit and by its determination to defend the native soil even against a much superior aggressor. The Greek navy consisted of only one 10,000-ton cruiser and one small 2,400-ton cruiser, both constructed before the war of 1914-18. In addition, there were 14 destroyers, 9 torpedo boats, 6 submarines and some miscellaneous craft. With its small army, air force and navy, Greece had to meet in the fall of 1940 the full onslaught of the highly militarized fascist Italian force.

At 3:00 A.M., on Oct. 28, the Italian minister to Athens transmitted to General Metaxas an ultimatum, according to which Italian troops would move into Greece by 6:00 A.M. the same morning if the Greek government refused to agree to an occupation of certain undefined parts and ports of Greece by Italian troops, air force and navy for their fight against Great Britain. The Italian government seemed to have relied on "fifth column" operation in Greece to bring about Greek surrender, either immediately or after a brief show of resistance. In reality, General Metaxas not only rejected the ultimatum but the Greek nation showed itself completely united in its fight against fascist aggression. Great Britain was asked for help, which was immediately forthcoming. The British air force established a base on the Greek island of Crete, and its bombers not only helped the Greek air force but hit successfully Italian invasion ports. Some British mechanized forces came to the help of Greece, and the royal navy proved of the utmost value.

As the Italians had prepared for the invasion of Greece for many months, by building the necessary roads in Albania and by erecting there fortified places from which to launch their attack, they were able to achieve some initial successes and to penetrate a few miles into Greek territory, in the north towards the most important Greek city on the road to Salonika, Florina, and in the south against Yannina. The Italian air force at the same time bombed Salonika, Patras and other Greek cities and ports. But soon the strong Italian air force was to lose completely the control of the air over Greece and Albania, so much so that on Oct. 2, 1941 the Italian high command had to ask officially for German air squadrons to come to Italian aid, and the Italian army was defeated by the Greek defenders who were able at the beginning of November to carry the war into Albanian territory. During November the Italian retreat turned into resounding defeat, in which the numerically and technically inferior Greek army was able to occupy large parts of Albania. In the north the important Italian base of Koritza, in the south the equivalent Italian base of Argyrokastron fell into the hands of the advancing Greeks, who occupied also Porto Edda, the southernmost Albanian port, named after Mussolini's daughter, and pushed on along the coast towards Valona. In December the biting cold and heavy snowstorms slowed up the Greek advance, but at no moment were the Italians able in 1940 to stop the Greeks or, in spite of all their preparations, to launch a counter-offensive.

(H. Ko.)

Greenland. The world's largest island (736,518 sq.mi., some 705,000 covered by glacier), in the Arctic ocean, N.W. of Iceland, and a Danish possession. Capital, Godthaab. Population of about 18,000 (est. 1940) is scattered in small settlements on the west coast, and 1,000 on the east coast, about 10 in all being Danes, the rest native Greenlanders. Seats of the governors are Godhavn in the north and Godthaab in the south.

History.—When Germany occupied Denmark on April 9, the status of Greenland was brought in question. On Nov. 2 came a report through Stockholm that a Norwegian patrol had foiled the attempt of a German expedition to take Greenland, or at least the weather bureau and wireless stations. Lacking reports from these stations since April, neither the German air force nor civilian authorities anywhere in the north Atlantic region could accurately forecast storms.

From time to time since 1916 the U.S. government indicated that it considered Greenland to lie within the scope of the Monroe Doctrine, stating in 1920 that it could not recognize the right of a third government to acquire the island. After April 9, 1940, at the instigation of the Greenland officials, the U.S. established a consulate at Godthaab, sent a Red Cross representative to investigate conditions, and facilitated purchase of arms for the police at the cryolite mine in Ivigtut. Trade formerly managed by the Danish government monopoly was in 1940 arranged through the Greenland delegation in New York, headed by the Greenland governor, Eske Brun. (F. D. S.)

Grenada: see WEST INDIES, BRITISH.

Grenfell, Sir Wilfred Thomason (1865-1940), British medical missionary, was born at Parkgate, Cheshire, England, Feb. 28, and died in Charlotte, Vt., Oct. 9. For a biographical sketch see *Encyclopædia Britannica*, vol. 10, p. 876.

Guadeloupe: see FRENCH COLONIAL EMPIRE.

Guam, a possession of the United States of America and the largest and most populous island of the Marianas, lies at the southern end of that group, approximately 1,500 miles E. from Manila; area about 225 sq.mi.; population on July 1, 1940, 23,067, including 21,502 natives of Guam who are called Chamorros; the remainder are foreign-born or personnel of the naval establishment.

The capital and only city is Agana, having about one-half the total population of the island.

The island was discovered March 6, 1521, by Magellan and remained a Spanish possession until June 21, 1898, when it was captured by the United States, later being ceded to the United States by the treaty of Paris. Since acquisition it has been under the jurisdiction of the navy department with a naval officer commissioned as governor by the president. The people are nationals and are regarded as wards of the United States; they are not citizens.

Immigration, while not prohibited, is not encouraged and no alien may own land.

Public schools had an average enrolment of 4,694 during 1939-40. Emphasis is placed upon the English language, health and sanitation, and upon industrial and agricultural training. Health and sanitary conditions are very satisfactory. All medical attention is given by the naval medical officers who treat the people free of charge.

Hospitalization is also provided without cost. The only bank is the Bank of Guam, conducting a commercial banking business as a division of the treasury of the naval government of Guam, which owns the capital stock. Copra is the principal export; 1,482 tons, valued at \$50,553, were exported during the fiscal year 1940; total exports were \$102,575; imports amounted to \$642,936. The community is essentially an agricultural one. The land is fertile and native foodstuffs are plentiful. Guam is an important link in the transpacific air route operated by Pan American Airways system. (L. S. F.)

Guatemala, second largest and most northerly of the Central American republics; language, Spanish; capital, Guatemala city; president, General Jorge Ubico. The area is 48,290 sq.mi. The population (1940 census) is 3,284,269, of whom 65% are Indians. The chief cities (with 1938 official population estimates) are: Guatemala city, 166,456; Cobán, 45,919; Quezaltenango, 41,858; Totonicapán, 40,900; Antigua, 40,000 (unofficial estimate); Jutiapa, 31,723; Quiché, 30,945; Zacapa, 30,113; Jalapa, 28,717; Chiquimala, 27,581; Escuintla, 26,985.

History.—Fear was felt, in 1940, that Guatemala might be used as a centre for the dissemination of German propaganda throughout the rest of Central America and South America. Though Germans are numerically few, the fact that they control 55% of the country's coffee plantations and 60% of the coffee acreage gives them considerable power. Two executive decrees of 1939 barred the nazi party and nazi propaganda from Guatemala, and, as a further precaution, the cities were patrolled by armed soldiers and the country by motorcycle police. Political parties were refused permission to hold public meetings. Guatemala continued to press her claims to British Honduras, asserting that the boundary treaty of 1859 had been invalidated by British noncompliance. In Jan. 1940, Great Britain formally offered to submit the question to arbitration (*see* BRITISH HONDURAS), but no steps had been taken by either side by the end of the year.

Communications.—Steamship and air service are the principal means for external communication, although the partially completed Pan American highway is increasing in importance. In 1940 a 5½-hour New Orleans-Guatemala air service was inaugurated by the TACA air lines.

As of Dec. 1939, Guatemala had 1,360 km. of railway and 6,098 km. of highway (of which 5,932 km. were open to traffic), with 1,040 km. of highway under construction, and 487 km. projected. Early in 1940, over half of the important 473-km. highway from Guatemala city to the Petén region had been finished. Completion of this highway is expected to eliminate the necessity of using air transport in the movement of chicle from the northern Petén region to Puerto Barrios. Air traffic, both internal and external, increased during the year.

Agriculture.—Guatemala, primarily a one-crop country, suffered from a decline in coffee prices as a result of the European war, but hopes were expressed that increased exports to the United States of such crops as bananas and chicle would alleviate the situation. Further easing of the situation may follow recommendations of a commission sent from the United States to scout the possibilities of rubber cultivation in Guatemala. Under terms of the Inter-American Coffee Quota agreement of Nov. 1940, Guatemala was allowed coffee exports to the United States of 535,000 bags of 60 kg. each (1938: 453,866 bags). Imports in 1939 were \$15,295,729 (United States, 54.5%; Germany, 27.0%), exports \$16,985,310 (United States, 70.7%; Germany, 11.5%). In the first nine months of 1940 imports declined 19% and exports 9%. Banana production in 1939 was 34% greater than in 1938. Bananas accounted for 32.3% of total export values. Chicle exports of 1,920,051 pounds valued at \$684,361 (a 12.1% increase in quantity and 33.3% in value over 1938) went to the United States.

Finance.—The monetary unit, the quetzal, is equal in value to the United States dollar.

Education.—Guatemala has over 2,500 schools, with an enrolment in excess of 145,000 pupils.

Defence.—Military service is compulsory. The army numbers 7,000 men.

Gustavus V (1858–), king of Sweden, of whom a biographical account will be found in the *Encyclopædia Britannica*, vol. 11, pp. 11–12, came to the throne in 1907 and, at the age of 82, is the oldest of the monarchs of Europe. That he is well loved by his people was attested at his 21st jubilee and especially at the great nationwide celebration of his 80th birthday in 1938. Since 1914 he has stood out as a leader of the movement for inter-Scandinavian peace and co-operation. In the autumn of 1939 he called to meet him in Stockholm the rulers of Denmark and Norway, and the president of Finland to indicate a moral solidarity of the states of the north. But he abhors war, and although he is a constitutional monarch, his experience and prestige give him considerable influence in the councils of state. Undoubtedly he has exercised this influence steadily to keep Sweden out of war, and in the popular mind he has become the leader of the strict peace policy. (F. D. S.)

Gynaecology and Obstetrics. On the North American continent the slow but constant decline in the maternal death-rate continued in 1940. The three chief causes of maternal deaths were still to be listed as haemorrhage, toxæmia and infection.

The steady improvement, or lowering, in the maternal death-rate recorded year after year was favourably affected, first, by the discovery of sulphanilamide and its related preparations and the successful treatment of puerperal infections, and second, by further haematologic studies of value in the prevention and treatment of shock from haemorrhage. Improvement in the standard of ordinary routine antenatal care of pregnant women effectively lessened the incidence of serious toxæmia of pregnancy, and thus has lowered its death-rate. Nevertheless, there were no new discoveries of note about either the cause or the treatment of pregnancy toxæmia once it becomes established in a patient. Dieckmann of Chicago was to publish a monograph on its latest developments.

Sulphanilamide greatly lowered the death-rates from infection where streptococci were the chief organisms involved. Unfortunately, however, staphylococcal septicaemic infections were not affected by sulphanilamide, and remained as universally fatal as they had been until sulphathiazole was synthesized and introduced by Fosbinder and Walter, and by Lott and Bergein. It is especially applicable to staphylococcal sepsis, staphylococcal pneumonia, and in pyelitis, or kidney infection, caused by *Bacillus pyocyaneus*.

Obstetric deaths from haemorrhage may now be better anticipated and prevented. Anaemias which appear in women previously well differ from pernicious anaemia by not responding to treatment with liver extract and iron, and usually disappear spontaneously after the pregnancy ends. Some of these, clearly iron deficiencies, do respond but the severe grades of this type of anaemia may require blood transfusion. These anaemias seem to be associated with and may be the result of certain vitamin deficiencies (A, E and D).

It has been recommended that plasma protein and haematocrit estimations be made routinely on patients about to undergo major operations, especially if they show any degree of anaemia. When the plasma protein is normal or high and haematocrit is low, transfusion with whole blood should be prepared for by the typing of suitable donors, or even by giving prophylactically before the operation. The findings should show that blood transfusion is warranted before undertaking it lightly as it still carries certain risks to the patient.

When reversed findings are observed, namely, low plasma protein and high haematocrit readings, transfusion with blood plasma only is required, this is a simple and safe procedure. Blood plasma is the fluid part of blood, the cells having been removed, and its administration requires no previous typing and matching of bloods of donors and patients. It is an all emergency measure.

Kastlin of Pittsburgh was undertaking a series of these estimations pre- and post-operatively in gynaecologic and other surgical patients in an effort to anticipate and prevent surgical shock. He was in 1940 extending his research to obstetric patients, so many of whom become shocked during the course of prolonged labours and difficult deliveries.

Vitamins.—Vitamin deficiencies, due to dietetic defects, seem to have more pronounced ill effects during pregnancy than during ordinary life, probably because of the extra demands made by the growing foetus. Deficiency in vitamin B complex is associated with certain types of neuritis in pregnant women (tingling or numbness in extremities, pain along nerve trunks and backache). There is also tingling and burning of the tongue and a heightened colour and a smoothing of the surface. Vitamin C deficiency has been blamed as a causative factor in habitual or repeated abortions; it causes certain purpuric skin eruptions and haemorrhagic lesions of the gums, or the early symptoms of scurvy, formerly seen in advanced cases more commonly than now. It is interesting that the vitamin C requirement during pregnancy as compared to that of normal average is approximately doubled due to foetal demands. Adequate supplies of vitamin must be forthcoming because it has a direct influence on all development, especially affecting subsequent dentition in the child. Vitamin D is essential for proper calcium metabolism in the mother, drained in some instances by the progressive bone development of the foetus. Vitamin E has been called the antisterility vitamin, because a lack of this in the diet is considered a contributing fault in sterile marriages, and in repeated abortions. Vitamin K has an influence on the prothrombin content of both maternal and foetal bloods and their clotting ability. Thus a deficiency of vitamin K predisposes to postpartum bleeding, and the bleeding of a haemophilic nature as well as intracranial haemorrhage in newborn infants.

Hormones.—Varying results have been reported by numerous investigators who have used for patients with different endocrine deficiencies certain of the hormones extracted from animal sources. The only ones with consistent effects are, still, those made from the thyroid gland for thyroid deficiency, and those used for the relief of menopausal symptoms at the time of "change of life." These latter are prepared from animal extractives of certain chemical radicals, synthetically constructed, likewise have arogenic properties or effects. The synthetic preparation termed stilboestrol was in 1940 still under investigation. Although its clinical effectiveness had been demonstrated, it had not yet been released for commercial use because of certain toxic reactions that have been reported following its use. Salmon, Walter and Geist utilized an ingenious method to obtain a more prolonged therapeutic effect than is possible when stilboestrol is administered by mouth or by hypodermic injection. Under local anaesthesia, they make a small skin incision and implant crystals of the preparation in the subcuticular tissues, closing the wound with sutures for healing. This method was being used in 1940 also at the Johns Hopkins hospital, presumably elsewhere, and reports about it were gradually forthcoming.

Operative Technique.—Operative technique in gynaecologic surgery underwent changes, usually and properly slow to be adopted because anything proposed as an improved method must be thoroughly tried out by many clinics before being generally accepted. Two examples suffice to illustrate the point. De Lee of Chicago proposed and persistently advocated for years the use of Caesarean section it was safer and gave better results to make the lower incision through its lower segment rather than in the upper portion of the body of the uterus as was customary by the "classical" operation. Contention was finally proved and accepted by innumerable operators on long lists of cases. In 1934 Phaneuf advocated a transverse rather than a vertical incision in the lower uterine segment for delivery by Caesarean section. This seemed, theoretically, to offer greater technical facilities and risks, but actually in practice, as Phaneuf contended, these practical objections do not exist, bleeding is less, and by his method one assured that the incision stays in the lower segment as it should and as was intended.

Another example of changing technique is that of hysterectomy or removal of the uterus, where this becomes necessary, through the vagina instead of through an abdominal incision, blood vessels being controlled by clamps instead of by tied ligatures of catgut. Kennedy of Philadelphia has been the foremost advocate of this method, claiming it to be a much shorter and less shocking operation with less risk of infection than the abdominal type, especially for patients not in the best of physical condition. He is able to perform some of these operations in as little as ten minutes time. Many clinics were in 1940 adopting this method for certain classes of cases.

Another item of technical interest is the prevailing abandonment of catgut sutures for closure of the heavy fascial layers of abdominal incisions in favour of interrupted, buried, nonabsorbable silk or linen sutures. It has been demonstrated that there is less local reaction in the tissues than in catgut, and this is important in the prevention of postoperative infection and herniation, especially in those tissues undergoing the greatest strain during the healing process. It was thought, previously, that only absorbable suture material could be used in areas where this was to be buried and allowed to heal in, on the ground that nonabsorbable sutures, as silk or fine wire would act as foreign bodies in the tissues, causing infection later. It has been found, however, that this is not true, that these sutures become embedded in fine fibrous or scar tissue, and that wound healing is generally stronger with fewer "stitch abscesses."

Gypsum. After having dropped during the depression years from a peak of some 12,500,000 metric tons annually to about 7,100,000 tons, world gypsum production was in 1940 again approaching the pre-depression level. The principal producers, with their approximate outputs are: United States 3,000,000 tons; France, Spain, United Kingdom and Canada, each about 1,000,000 tons; Germany 850,000 tons; Italy 400,000 tons; the remainder is widely distributed among some two dozen different countries, few of which have outputs as high as 100,000 tons.

The 1938 output in the United States, 3,196,000 short tons, was the greatest since 1930, with the output gradually increasing as the building industry comes back more nearly to normal, and military camp and defence plant construction will presumably improve the demand. Preliminary figures for 1940 show an improvement of about 10%.

About 19% of the current output is used in cement manufacture in crude form, and 2% goes to various minor uses; the remainder is calcined and, except for some 3% that is used in the glass and ceramic industries, is absorbed in the production of plasters, wallboard and other building products. U.S. production is supplemented by imports, chiefly from Canada, to the extent of about 20% of the consumption. Canadian production in 1939 was 1,408,000 short tons, and preliminary figures for 1940 indicate a 10% rise over 1939; about 80% of the output is exported, nearly all to the United States.

(G. A. Ro.)

Haakon VII (1872–), king of Norway, of whom a biographical account will be found in the *Encyclopædia Britannica*, vol. 11, pp. 50–51, was born Prince Charles of Denmark, second son of Frederick VIII (and brother of Christian X). Upon the separation of Norway from Sweden he was elected king by the Norwegian storting (Nov. 18, 1905), and took the old Norse name of Haakon, and that of Olav for his son the crown prince. Haakon married Maud, youngest daughter of King Edward VII of England.

Haakon VII proved himself well adapted to the difficult position of a sovereign in a democratically-minded country. He stood aside from political strife, and represented his people in worthy fashion. In the crisis of 1940 he displayed a calm heroism in the face of national disaster and repeated bombing attacks seemingly aimed particularly at him. He fled from place to place in southern Norway, then to the north. On June 7 (35 years to the day from the achievement of Norway's complete independence) he and the rest of the government took ship for England, where they established headquarters. He firmly refused the request of four members of the "presidential board of the storting" that he abdicate. (See also NORWAY.) (F. D. S.)

Hadfield, Sir Robert Abbott (1858–1940), British metallurgist, was born in Sheffield, Nov. 29, and died in London, Sept. 30. For a biographical sketch see *Encyclopædia Britannica*, vol. 11, p. 63.

Haggard, William David (1872–1940), professor of surgery at the medical school of Vanderbilt university, Nashville, Tenn., was born in Nashville, Sept. 28. He received his doctor's degree from the University of Tennessee in 1893 and began to practise in Nashville. Three years later he was appointed professor of gynaecology and abdominal surgery in the University of Tennessee, serving until 1912. Since 1913 he had been professor of surgery at Vanderbilt. He enlisted in the army medical corps during the World War of 1914–18 and was surgeon of Evacuation Hospital No. 1 at Toul, France, 1918–19, and was consultant in surgery at the Mesves Hospital

Center, France. He was elected president of the American Medical association in 1925, the Postgraduate Medical Assembly of North America in 1930 and the American College of Surgeons in 1932. He was one of the organizers of the Southern Medical congress. He died in Palm Beach, Fla., Jan. 28.

Hagner, Francis Randall (1873-1940), U.S. genito-urinary surgeon, was born in Washington, D.C., Feb. 19, was graduated from the medical school of George Washington university in 1894, and began practice in Washington, D.C., in 1896. He was attached to Johns Hopkins hospital in Baltimore in 1895-96 and was professor of genito-urinary surgery in George Washington university from 1905 to 1939, when he was made professor emeritus. He originated several operations which were adopted by other surgeons. At one time he was president of the Clinical Society of Genito-Urinary Surgeons.

He died in Washington, July 7.

Hainisch, Michael (1858-1940), former president of the Austrian republic, was born at Aue. Lower Austria, Aug. 15. He died at Gloggnitz, Feb. 29. For a biographical sketch see *Encyclopædia Britannica*, vol. 11, p. 78.

Haiti, a West Indian republic occupying the western third of the island of Hispaniola; language, French; capital, Port-au-Prince; president, Stenio Vincent. The area is 10,204 square miles. The population is approximately 3,000,000, and is almost entirely Negro.

The chief cities are Port-au-Prince, pop. 125,000 and Cap Haitien, pop. 14,000. These and Port Liberté, Cayes and Saint-Marc are the most important ports.

History.—During 1940 the economic uncertainty which had characterized Haiti in the preceding year crystallized into an acute economic depression as the country began to feel the full effects of the European war's disruption of international trade. Coffee, the chief money crop and main reliance of the Haitian small landholder, was especially hard hit, as the value of coffee shipments, normally half of the export total, declined by 45%. In an effort to bolster shrinking government revenues, an additional export duty was levied on coffee, but its effects were to impair materially the saleability of the commodity. At the end of September a third of the crop was still unsold. The Inter-American Coffee Quota agreement in November, allotting 275,000 bags as Haiti's quota for export to the United States, gave promise of some economic relief, but did not provide for the full crop, estimated to be 400,000 bags for the 1940-41 season, particularly since over a third of the 1939-40 crop had gone to European markets no longer open. Politically, interest centred about the presidential elections of May 1941, as strong pressure was brought to bear upon President Vincent to be a candidate for a third term.

Education.—Haiti has over 400 primary and secondary schools, with total enrolment of 50,000. The University of Haiti is at Port-au-Prince.

Finance.—The monetary unit is the gourde, fixed by law at 20 cents U.S. The gross public debt on Sept. 30, 1940, was \$12,103,124, a 21% increase over the previous year and 38% over 1938. Expenditures on public works in the 1939-40 fiscal year totalled \$1,751,000. Fiscal control is in the hands of a financial adviser nominated by the president of the United States.

Trade and Communication.—External communication is by sea and by air. In 1940 there were 164 mi. of railway and in excess of 1,000 mi. of motor highway. Imports for the fiscal year ending Sept. 30, 1940, totalled \$7,940,200 in value, a decline of

2.3%, and consisted largely of textiles, foodstuffs and miscellaneous manufactured articles. Exports were \$5,399,000, a drastic decline of 25.7% from 1938-39, and comprised coffee (38.0%), sugar (17.5%), sisal hemp (12.5%), bananas (11.7%), cotton (11.3%) and cacao (1.8%). Imports came largely from the United States (73.31%), followed by Great Britain (11.78%), France (4.26%), Japan (2.79%), the Netherlands and Netherlands West Indies (1.9%) and Belgium (1.57%). These represented a sharp increase from the United States over the preceding two years (1937-38, 55.09%; 1938-39, 62.96%); a moderate increase for Japan; a slight decline for Great Britain, and the virtual disappearance of imports from Germany (5.65% in 1938-39). Exports were taken by the United States, 52.09%; marked increase over 43.11% in 1937-38 and 34.73% in 1938-39; Great Britain, 30.21% (a sharp rise from 18.88% in 1937-38); Belgium, 9.39%; France, 4.25%; and Denmark, 1.76%.

BIBLIOGRAPHY.—L. L. Montague, *Haiti and the United States, 1714-1940*. (L. W. BE)

Halifax, Edward Frederick Lindley Wood,

3RD VISCOUNT (1881-), British statesman. See *Encyclopædia Britannica*, vol. 11, p. 93 for his biography. On Feb. 1938, he succeeded Anthony Eden (q.v.) as foreign minister, retaining this post through the "Munich era" and through various reshufflings of the war cabinets of Chamberlain and Churchill. On Dec. 23, 1940, he was named British ambassador to the United States. Eden then resumed his former position at the foreign office.

Hambro, Carl Joachim (1885-), Norwegian statesman, was born at Bergen, Jan. 5 and was educated at Oslo university. In 1913 he became editor of the Oslo *Morgenbladet*, for which he had worked during his days as a student. In 1919 he was elected on the ticket of the Conservative party to the Norwegian storting, of which he became president seven years later. A fervent believer in the League of Nations, Hambro was elected president of the assembly which expelled the U.S.S.R. from membership in the League for its aggression against Finland. After the German occupation of Norway in April 1940, Hambro was forced to leave the country. In reply to German Foreign Minister Ribbentrop's claim of documentary evidence that Great Britain had planned the invasion of Norway, Hambro declared on April 28 at Stockholm that he had "irrefutable proof that Germany prepared detailed plans for the invasion of Norway months before it actually occurred."

Hammer Throw: see TRACK AND FIELD SPORTS.

Hand-ball. Hand-ball continued its popularity in 1940. Field grounds, high schools, colleges and other many yearly offer increasing facilities for the game to both men and women of all ages. The classic event is the national A.A.U. field wall championship held every year. In 1940, the Downtown Y.M.C.A. of Detroit, Mich., was the host with entries representing every section of the country. The winner of the singles, for the sixth consecutive year, was Joseph Platak of the Lake Shore Athletic club, Chicago. In the doubles, Joe Gordon and J. Goldsmith of Long Beach, Calif., were the victors.

National Four-Wall Rankings for 1940

Singles

1. Joseph Platak, Chicago
2. Jack Clements, San Francisco
3. Angelo Trulio, Brooklyn

Doubles

1. Joe Gordon and J. L. Goldsmith, Long Beach, Cal.
2. Edward Linz and Frank C. New York
3. G. Cappell and R. Maguire, San Francisco

There was considerable interest manifested in the one-wall me which is played almost exclusively in the east. New York city s been the scene of all the national tournaments in this branch the game and is considered to have the best players in the untry.

National One-Wall Rankings for 1940

Singles

Morton Alexander, New York
Victor Herschkowitz, New York
Leon Black, New York

Doubles

1. Morton Alexander and Marvin Hecht, New York
2. J. Garber and J. Londin, New York
3. S. Lipsky and V. Herschkowitz, New York

Hanson, Ole (1874–1940), U.S. mayor and real estate operator, was born in Racine county, Wis., Jan. 6, and studied law from 1890 to 1894 in Racine. In 1902 he went Seattle, Wash., and engaged in the real estate business. He served in the state house of representatives in 1908–09. He was elected mayor of Seattle in 1918 and won national fame for his settlement of an extensive strike in Feb. 1919. Hanson moved to Southern California in 1924 where he engaged in real estate operations. He died in Los Angeles, July 6.

Hanson, Richard Burpee (1879–), Canadian legislator, was born March 20 in Andrews, N.B. and received his law degree from Dalhousie University in 1901. He practised law in Fredericton, N.B. for a number of years and was active in municipal politics there, being mayor from 1918 to 1920 and city solicitor from 1920 to 1926. He was elected to the house of commons in May 1921, but parliament was dissolved before he took his seat. He was re-elected in 1921, 1925, 1926 and 1930, and was defeated in 1935. From 1934 to 1935 he was minister of trade and commerce in the Bennett cabinet. On May 14, 1940 he was chosen leader of the opposition (Conservative) party to succeed Dr. R. J. Manion, who had been defeated in the general election of March 26.

Harbours: see RIVERS AND HARBOURS.

Harrington, Sir Charles Harrington (1872–1940), British general, was born in Chichester, May 31, and died in Cheltenham, Oct. 22. He was governor of Gibraltar from 1933 to 1938 and was the author of a life of Field Marshal Viscount Plumer. For further biographical details see *Encyclopædia Britannica*, vol. 11, p. 196.

Harkness, Edward Stephen (1874–1940), U.S. philanthropist, was born in Cleveland, Ohio, Jan. 22, the son of Stephen V. Harkness, one of the early associates of John D. Rockefeller in the Standard Oil company. He studied at Yale university and was graduated in the class of 1897. By the successive deaths of his father, mother and brother he came into possession of the vast family fortune, part of which was invested in the Southern Pacific and the New York Central railroad companies. He was a director in each company. His chief interest, however, lay in the distribution of the principal and income of his fortune to charitable and educational institutions. His mother, by a gift of \$30,000,000, established the Commonwealth fund for general philanthropic purposes. In 1938, Mr. Harkness increased this fund by a gift of \$8,000,000. He established the Pilgrim trust in England by an endowment of \$10,000,000 for promoting the future well-being of Great Britain. He offered \$3,000,000 to Yale for the erection of a group of houses to bring the students in closer contact with one another

and with their instructors. When it was rejected he offered the money to Harvard. It was accepted and the houses were built, but it took \$8,392,000 more than his original offer to Yale to complete the work. Yale changed its mind and he gave \$12,000,000 to that university for carrying out a similar plan; he gave more than \$6,000,000 to Columbia university and \$7,000,000 to Phillips Exeter academy. His gifts were estimated at \$100,000,000. He died Jan. 29 in New York city.

Harrington, Francis Clark (1887–1940), U.S. army officer and commissioner of the Work Projects administration, was born in Bristol, Va., Sept. 10, and was graduated from the United States Military academy in 1909. He afterward studied in the engineering school of the U.S. army, the general staff school, the Army War college and in the French War college. He advanced through various grades till he reached the rank of colonel in 1938. During the World War of 1914–18 he was an instructor in officer training camps. He also served as instructor in mathematics at West Point and as assistant engineer of maintenance at the Panama canal. In 1935 he was appointed assistant administrator of the Work Projects administration under Harry L. Hopkins. When Mr. Hopkins was appointed to the cabinet Harrington was named as commissioner of the WPA. He died in New London, Conn., Sept. 30.

Harvard University, oldest institution for higher education in the United States, completed the fourth year of its fourth century in 1940. At the end of the fiscal year, June 30, 1940, investments exclusive of land, buildings and contents used for educational purposes stood at \$143,922,931. Gifts during the year were \$3,462,044 for capital account and \$1,395,898 for immediate use.

Scholarships and other student aids totalled \$710,137, exclusive of student loans. The year 1940–41 began with an enrolment of 7,845 full time students and a faculty and educational administrative staff of 1,930. The university library, largest university library in the world, had 4,159,606 volumes and pamphlets on June 30, 1940.

Harvard inaugurated a new combined seven-year course under the faculties of arts and sciences and of law, leading to the A.B. or S.B. and the LL.B. degrees. Announcement was made that the university will start in 1941 a new five-year course in dental education, made possible through gifts of \$1,300,000; the dental school will be renamed the School of Dental Medicine, and dental school students will register in both the new school and the medical school. Professor Francis T. Spaulding became dean of the graduate school of education, succeeding Dean Henry W. Holmes who became chairman of the university's committee on educational relations. The school of education established a new section of educational administration. Harvard opened a new department of Celtic, headed by Associate Professor Kenneth H. Jackson, formerly of Cambridge university, England. During the summer the university established its fourth astronomical observatory, in the Colorado Rocky mountains. Instruction for undergraduates in required English composition was extended with the establishment of five special instructorships in addition to the regular teaching staff.

Hawaii. The territory of Hawaii consists of a group of eight larger islands and numerous islets in the Pacific ocean

between latitudes $18^{\circ}55'$ and $22^{\circ}15'$ N. and between $154^{\circ}50'$ and $160^{\circ}30'$ W. longitude. Their total area is 6,438 sq.mi. The islands are of volcanic origin. From southeast to northwest, they are Hawaii, Kahoolawe, Maui, Lanai, Molokai, Oahu, Kauai, Niihau. In addition, stretching northwestward beyond Niihau over 1,100 mi. is an archipelago of rocks, reefs and shoals which includes Midway (longitude $177^{\circ}22'$ W.) notable as the first stop beyond Honolulu of the China clipper planes. Likewise, 960 mi. south of Honolulu and a part of the city and county of Honolulu lies Palmyra, a coral atoll consisting of 55 islets, five miles long and two and a half miles wide. The youngest island, geologically, and the largest in the group is Hawaii, with an area of 4,030 sq.mi.

The capital of the territory is Honolulu, situated on the island of Oahu. It is a completely modern city with a population (1940 preliminary census figures) of 179,358. The population of Hawaii (1940 census figures) is 423,330. The racial origin of this population, in addition to the native Hawaiians and Caucasians from the mainland, is Japanese, Chinese, Korean, Filipino, Portuguese. However, 82% of the population is native born.

The governor in 1940 was Joseph B. Poindexter; and the delegate, Samuel W. King. The territory collected in taxes and fees \$15,429,059.08 in 1940, and expended \$16,501,566.48. In addition, federal taxes were paid into the United States treasury of \$9,721,626.41, exceeding the payment of 12 states of the union.

Agriculture.—Hawaii's chief crops are sugar and pineapples. Expert management, scientific methods, and costly irrigation works have raised the sugar production to a maximum of 1,035,548 tons in 1933 with a value of \$66,482,181. The value of the 1939 sugar shipments was \$55,217,926. The pineapple industry, next in importance, produced 848,003,809 lb. with a value of \$50,822,533. Other agricultural crops are coffee, macadamia nuts, papayas and taro, a root used by the natives in making the native "poi" and also now being processed into flour.

The tourist industry has developed rapidly since 1920, reaching a total of 65,431 visitors in the calendar year 1939.

Hawaii has assumed an increased importance as a defence outpost. Probably the strongest fortifications in the Pacific are located on the island of Oahu. (R. E.M.)

Hawthornden Prize: see LITERARY PRIZES: *Great Britain*.

Hay. Acre yield of tame hay in 1940 in the United States, at 1.40 tons per acre, was 12% better than the ten-year average and has been exceeded but twice in 20 years. Total production was estimated by the department of agriculture in October

Table II.—Production of All Kinds of Hay in the U.S., 1940 and 1939

	1940 tons	1939 tons
All kinds of hay	95,156,000	85,124,000
All tame hay	86,312,000	76,099,000
Wild hay	8,844,000	9,025,000
Alfalfa hay	30,578,000	26,888,000
Clover and timothy hay*	29,287,000	23,780,000
Grains cut green for hay	4,260,000	3,901,000
Cowpeas for hay	1,567,000	1,623,000
Peanuts for hay	1,003,000	878,000
Soybeans for hay	1,018,000	1,460,000
Lespedeza hay	3,700,000	3,816,000
Sweet clover hay	808,000	1,028,000
Sweet sorghums for forage and hay	13,816,000	8,704,000
Miscellaneous tame hay	8,539,000	7,545,000

*Does not include sweet clover and lespedeza hay.

Table III.—Hay Seed Production in the U.S., 1940 and 1939

	1940 bushels	1939 bushels		1940 bushels	1939 bushels
Red clover	1,994,400	1,798,100	Timothy	1,312,000	1,417,800
Alsike clover	100,000	95,000	Lespedeza	159,120	145,370
Alfalfa	1,453,000	1,488,200	Sweet clover	900,700	1,417,000

as 86,312,000 tons, compared with 76,099,000 tons in 1939 and ten-year (1929–38) average of tame hay of 69,650,000 tons. With the 1940 production of wild hay at 8,844,000 tons, the total crop of all kinds of hay was 95,156,000 tons. This includes 30,578,000 tons of alfalfa hay. See ALFALFA. (S. O. R.)

Hay Fever: see ALLERGY; AIR CONDITIONING: *Physiological Benefits*.

Head, Sir Henry (1861–1940), English neurologist, was born Aug. 4, and was educated at Trinity college, Cambridge, and the universities of Halle and Prague. He was a fellow of the Royal College of Physicians as well as a fellow of Trinity college. He was noted for his study of nerve sensations which led to the subdivision of the human body into definite zones now called Head areas. He lectured at Fordham university in New York city in 1912. He wrote *Areas of Pain*, *Studies in Neurology* and several other medical books and was knighted in 1927. He died in Reading, England, Oct. 9.

Health Insurance: see SOCIAL SECURITY.

Hearing Aids: see DEAFNESS.

Heart and Heart Diseases. Wartime needs in 1940 tended to submerge other aspects of medical advance, in the study of the heart as well as in other fields. There was an emphasis of the importance of the recognition and proper handling of what was called the "soldier's heart" in the war of 1914–18, but which has been more properly, though not yet quite satisfactorily, labelled "neurocirculatory asthenia." Obviously much more study of neurocirculatory asthenia was needed than had been expended in the past, not only because of its obscurity but also because of its great importance in wartime, and indeed even in peacetime. In brief, it consists, when well marked, of a group of symptoms which are in large part circulatory and nervous: palpitation (and often rapid heart beating), shortness of breath (usually with sighing), heartache with short sharp precordial stabs (not angina pectoris), faintness (and often syncope), dizziness, easy fatigability, increased perspiration, tremor and nervousness. It has been variously wrongly called heart disease, thyrotoxicosis (exophthalmic goitre without exophthalmos), an infectious or toxic state, malingering and a psychoneurosis, all of which it loosely resembles. Although the heart itself is normal structurally in uncomplicated cases, nevertheless neurocirculatory asthenia may be so severe that it is a cause for disability, partial or complete, temporary or permanent. Less

Table I.—Production of Tame Hay by States, 1940 and 1939

	1940 tons	1939 tons		1940 tons	1939 tons
Wisconsin	7,416,000	5,829,000	Vermont	1,113,000	1,133,000
Iowa	6,572,000	4,994,000	North Dakota	1,109,000	1,126,000
New York	5,554,000	4,177,000	Utah	1,062,000	968,000

published, after 20 years, a second edition of his useful little book on the "soldier's heart." Among others, Fraser wrote again on the subject, advising immediate discharge from the military services of all of those with high degrees or ineradicable causes of this condition. Of greatest importance, however, was the step taken by the subcommittee on cardiovascular disease of the National research council of the U.S.A. in the course of its revision of the army's criteria for admission of new recruits; this consists of the immediate rejection of all those candidates who show more than a minimal degree of the condition, carefully excluding the possible effect of any temporary illness such as an acute respiratory infection. This step was taken because of the fact that during and after the war of 1914-18, neurocirculatory asthenia far more than any actual heart disease was a cause of bothersome and prolonged disability among soldiers, helping to overcrowd convalescent wards and camps and veterans' bureau hospitals, which could have been devoted to cases of trauma and acute illnesses. Other cardiovascular contributions of importance or special interest during 1940 included proof of the influence of diabetes mellitus in increasing the early incidence of coronary artery disease (Root *et al.*); the demonstration by careful injection and x-ray technique of the remarkable anastomoses of the coronary arteries in the development of coronary disease (Schlesinger, Blumgart and Davis); the decreasing mortality from rheumatic heart disease in the age group from 5 to 25 years old in the U.S.A. (O. F. Hedley); the demonstration that fever in congestive heart failure is to be ascribed to some complication, especially to pulmonary infarction or infection even though such may be concealed (Kinsey and White); the introduction of a new symptom of early failure of the right ventricle, namely, liver pain on effort (Boyer and White); the proof that rheumatic mitral stenosis may permit survival beyond 80 years of age (White and Ruffin); and the important facts that arteriosclerotic aneurysms of the thoracic aorta in aged persons should not only be recognized as such in contrast to luetic aneurysms, with avoidance of unnecessary and probably harmful specific treatment, but that such aneurysms may by rupture themselves be the cause of death (Ruffin, Castleman and White).

Helium. The only commercial sources of helium in the world are the natural gas fields of southwestern United States. The Cliffside helium reserve, covering 50,000 ac., which supplies the government-operated helium recovery plant at Amarillo, Tex., has an estimated reserve of 100,000,000,000 cu.ft. of natural gas with 1.8% helium and produced 383,062,000 cu.ft. of

gas, while the recovery plant produced 6,281,800 cu.ft. of helium in the fiscal year ending June 30, 1939 and an additional 3,906,000 cu.ft. in the second half of 1939. The bulk of the output is supplied to the army and navy for aircraft use, but 1,068,300 cu.ft. was sold to non-government purchasers during the year, 265,800 cu.ft. for medical, 9,600 cu.ft. for scientific and 792,900 cu.ft. for commercial purposes. Mixed with oxygen, helium is a valuable substitute for air in the treatment of asthma, laryngitis, croup and diphtheria, as the effort required for the breathing of this mixture is only about half that required for air. The difficulty known as "bends," suffered by divers and caisson workers when coming out of high pressure, is due to the liberation in the capillaries of small bubbles of nitrogen which had become dissolved in the blood under heavy pressure; this may be obviated by the use of a helium-oxygen mixture instead of air, since helium is insoluble in the blood, but as yet the cost of helium is too high to make its use possible under ordinary working conditions. The use of helium for the inflation of toy balloons is being promoted, in order to avoid the liability of injury to children from the explosion of hydrogen-filled balloons. The substitution of helium for hydrogen in test balloons was being made in 1940 by the U.S. weather bureau and will eventually require some 1,500,000 cu.ft. annually. (G. A. Ro.)

Heredity. There have been two considerable advances in the field of sex-determination. The forms in which the female is diploid and the male haploid have long constituted a problem. In one of these, the parasitic hymenopteran *Habrobracon*, the work of Bostian and of Whiting has now shown that there is a series of allelic genes of such a nature that an individual carrying only one (either haploid or diploid and homozygous) is male; an individual carrying any two different members of the allelic series is female.

It has been supposed that one of the effects of polyploidy in a dioecious species must usually be an upset of the sex-determining mechanism. While this conclusion remains probable for many organisms, it has been shown not to apply to the seed-plant *Melandrium*, where tetraploid races have no disturbance of the sex-determining system, as shown by Westergaard and by Warmke and Blakeslee. This is because in this plant the chief male-determining element is the Y chromosome, rather than the autosomes as in previously analyzed cases.

There is a growing body of evidence suggesting a simple relation between genes and specific proteins. Among the most striking examples are those found in the species hybrids of doves; but here, as in most other clear-cut examples, the results have been based almost exclusively on the proteins of the red blood cells. The work of Cumley and Irwin has shown that, in these same dove hybrids, similar relations hold also for the differences in serum proteins. The result strengthens the hypothesis that many proteins owe their specificity directly to gene activity. In this connection, attention should be called to Wiener's excellent summary of the existing state of knowledge concerning the blood-groups of man.

There are a number of different sex-linked characters in man, and these should be linked to each other. The available evidence on the point has been scanty, and has suggested that such linkage is close.

White has now reported on a family in which both colour-blindness and night-blindness were present, and has presented a large family tree. It is clear that these two sex-linked genes give at least 40% recombination, so that it must now be supposed that there is much crossing over between the two X chromosomes of the human female.

Another result in human genetics was reported by Lennox,

Gibbs and Gibbs, who have studied the electroencephalographs of epileptic patients. There is a characteristic "brain-wave" pattern, present in extreme form during an epileptic attack, but recognizable at all times in people who are or have been subject to such attacks. The studies show that this same pattern may also be recognized in some of the relatives of epileptics—and that the pattern behaves as a simple Mendelian dominant character.

Evidently this is the inherited element in epilepsy, and about one in twenty individuals having the pattern shows the symptoms of epilepsy.

Numerous studies have appeared in the field of "physiological genetics," including a book by Waddington that attempts to formulate a general theory of the relation of genes to development. One result here may be noticed: as the outcome of a series of studies by many workers, it has been found that the effects of the eye-colour hormone of insects (a hormone whose production is under simple genetic control) may be simulated by the known chemical substance kynurenin. (See also GENETICS.)

Hering, Hermann S. (1864–1940), U.S. Christian Scientist lecturer, was born in Philadelphia, Pa., Aug. 24 and was graduated from the University of Pennsylvania in 1886. He took special courses in electrical engineering in London in 1889, after teaching in the manual training school in Philadelphia. He was an associate in electrical engineering at Johns Hopkins university from 1891 to 1899. He became interested in Christian Science in 1897 and was a reader in the church at Baltimore for five years. In 1902 he was made first reader in the Mother Church in Boston, and later he was made president of the church and a member of the board of lecturership. He spent his time after 1905 lecturing throughout the United States and other countries. He died in Boston, May 15.

Hershey, Lewis B. (1893–), deputy director of the U.S. selective service, was born on a farm near Angola, Ind., and was graduated from Tri-State college at Angola. In 1916 he went to the Mexican border with the Indiana national guard, was advanced to lieutenant, and later was commissioned captain at Fort Sill, Okla. He went to France with the 137th field artillery in 1918 and upon his return to the United States passed his examinations for a commission in the regular army. He was then stationed at the field artillery school at Fort Sill and subsequently at Ohio State university, where he was assistant professor of military science and tactics for four years, at the command and general staff school for two years, and at the Army War college, where he graduated in 1934. After completing the latter course he was sent to Hawaii for two years. In 1937 he was appointed to the joint army and navy selective service committee as executive secretary. He was largely responsible for laying the foundation and setting up the machinery for the selective service system which went into effect during 1940. In recognition of this work he was raised to the rank of brigadier general in Nov. 1940.

Heyward, DuBose (1885–1940), U.S. author, was born in Charleston, S.C., Aug. 31 and was educated in the public schools. His father died when he was two years old, and at the age of nine he helped support the family by selling newspapers. When he was old enough he worked on the Charleston docks. His first book of poems, written in collaboration with Hervey Allen, was *Carolina Chansons*, published in 1922. His first and most successful novel, *Porgy*, appeared in 1925. Among his other novels are *Peter Ashley* (1932), *Lost*

Morning (1936), and *Star Spangled Virgin* (1939). He died in Tryon, N.C., June 16.

Highways: see ROADS AND HIGHWAYS.

Hill, Eben Clayton (1882–1940), U.S. roentgenologist, was born in Baltimore, Md., Oct. 1. He was graduated from Johns Hopkins university in 1903 and spent the next two years as a research student at the University of Freiburg, Germany. Returning to Baltimore, he was graduated from the Johns Hopkins medical school in 1907. He practised medicine in Baltimore and Poughkeepsie and while in the latter city was roentgenologist in the Vassar hospital. He returned to the faculty of Johns Hopkins in 1920. From 1917 to 1919 he served with the U.S. medical advisory board. He died June 1 at Fitchburg, Mass.

Hillman, Sidney (1887–), U.S. labour leader, was born at Zagare, Russia, on March 23, the son of a merchant. In his youth he studied to become a rabbi but left school to work in a chemical laboratory in Kaunas. In 1907 he migrated to the United States, where he worked first as a clerk then as a garment cutter. In Chicago he interested himself in labour unions, led a successful strike in a clothing house and by 1915 was president of the Amalgamated Clothing Workers of America, an office he still occupies. He went to Washington in the early days of the New Deal and became a member of the labour advisory board of the NRA. He served on the National Industrial Recovery board in 1935, and the next year as treasurer of Labor's Non-Partisan league, campaigned vigorously for the re-election of President Roosevelt. Later he was a member of the textile and clothing industry committees for the Fair Labor Standards board and was elected vice-president of the Congress of Industrial Organizations. Upon the organization of the advisory commission to the council of national defence, May 28, 1940, Hillman was named commissioner of employment. With William S. Knudsen (*q.v.*) he became the most prominent figure in U.S. defence activity Jan. 7, 1941, when President Roosevelt appointed him associate director general of the Office of Production Management, the new "superdefence" agency.

Hispanic America: see LATIN AMERICA.

Hispanic America and the European War.

The first problem to arise from the "Graf Spee" incident during 1940 was the necessity on the part of Argentina, involuntary host of around 1,000 of the "Graf Spee" crew, to determine upon their disposition. At first, despite British protests, they were permitted to remain in Buenos Aires, but when several disappeared (aboard Italian ships, it was freely believed), steps were taken to effect a partial internment, and many were sent into the interior. During the course of the year, however, a considerable number succeeded in escaping the country.

Two near-repetitions of the "Graf Spee" incident occurred during 1940, as British auxiliary cruisers, the "Alcantara" in July and the "Carnarvon Castle" in December, entered Rio de Janeiro and Montevideo respectively for repairs after engagements with German naval units in the south Atlantic.

Economic Effects.—Of more vital consequence to the American republics was the effect of the war upon their external trade relationships. Almost without exception their economy had rested upon the export of one to three prime raw materials. While the United States was, in most cases, the principal purchaser of these goods, sales to European countries represented

considerable portions of their exports. In the earlier months of 1940, loss of the German market and curtailment of many purchases by France and Great Britain were strongly felt. During 1938, Germany had taken from 13 different Hispanic American countries proportions of their exports ranging from 7.7% (Mexico) to 23.5% (Uruguay), and, even in 1939, from 6.8% to 11.1% of the exports of 12 of those countries. On certain commodities the proportion was even greater. Thus, Germany had purchased over half of Venezuela's coffee in 1938, and had ranked second in coffee purchases from seven of the other eight leading Hispanic American producers. Fifteen Hispanic American countries in 1938, and 16 in 1939, purchased a minimum of 10% of their import requirements from Germany. Only Cuba had received less than 5% of its imports from Germany in any one year.

Although enhanced sales of foodstuffs to France and Great Britain stimulated the export trade of some areas, notably the Latin America region, these increases were only partially effective, for Great Britain, lacking the ready cash with which to pay, was compelled to impound the proceeds and to seek deferred credits in other ways. Consequently, Argentina and Uruguay, the greatest beneficiaries of British war buying, were faced by serious shortage of foreign exchange with which to meet obligations elsewhere.

The already mounting effect of the war upon Hispanic America was tremendously accelerated when Germany opened its spring campaign against Denmark and Norway, following its invasion and conquest of the Netherlands and Belgium, and eventually of France. Spread of the war to these hitherto neutral regions and, in effect, to Sweden, now cut off from direct commercial contact overseas, dealt a staggering blow to Hispanic American economy, for the Scandinavian countries alone had absorbed nearly 15% of Hispanic America's exports in 1939. Too, Scandinavian shipping had been highly important in the transportation of goods, and loss of these facilities tended to cripple commerce throughout Hispanic America.

Fifth Columnism.—Following disclosure of the role played by fifth columnists in facilitating German invasion and conquest of Norway and other countries, Hispanic American countries generally felt alarm over fifth columnism within their own borders. Many investigations, both government and private, were made, and some of the disclosures aroused alarm and near-panic. In Chile plots aimed at the overthrow of the Uruguayan government were uncovered, and to sustain public morale two United States cruisers visited that country. Fears were felt, especially in Brazil, Argentina and Chile, that German- and Italian-descended citizens of these countries would become focal points for totalitarian agitation. In the case of the latter, little or no evidence of any widespread and concerted movement was disclosed, but serious pro-Nazi activity in some sections of Argentina, notably the Misiones territory, developed toward the end of the year. Most of the fifth columnism, suspected or proven, centred directly in the diplomatic and consular offices of the axis powers. Mexico, in consequence, requested the press attaché of the German legation to leave the country, and, upon his failure to do so, promptly handed him his passports. In Costa Rica secret arms caches were uncovered by government agents.

Inter-American Co-operation.—The year was marked by several efforts at formal co-operation. As early as Jan. 1940, the Inter-American Neutrality committee, an outgrowth of the Panama conference, began meetings at Rio de Janeiro, and studied measures to control or prevent violations of the "safety zone." The Inter-American Financial and Economic Advisory committee, likewise set up by the Panama conference, met at Washington to devise means of offsetting the loss of markets and other

A MILITARY MISSION of nine Hispanic American republics began a two-week tour of U.S. defenses Oct. 1, 1940. Here they inspect a relief map of Hispanic America in the Pan-American building at Washington, D.C.

disturbing economic effects of the war. One of its more important results was a plan for an inter-American bank.

The Havana Conference (July 21–30, 1940).—At Panama, ten months earlier, the desire was to strengthen the hemisphere's neutrality and to cushion the economic shocks of the war. Although these were still live problems at Havana, the more urgent question was that of hemisphere defence. Politically and economically, the war had come closer to the Americas. When the conference met, it promptly gave attention to statements of United States policy just enunciated by that nation in which it formally declared it would not recognize the transfer of any geographic regions of the western hemisphere from one non-American power to another. The United States also proposed a trade cartel, and, through its minister to Uruguay, announced that it would lend any assistance desired to crush alien seditious activity which might imperil the political and economic freedom of any American nation, should it be requested. In view of past timidity on the part of the United States in expressing its policies, these statements had a thoroughly heartening effect on Hispanic American statesmen who feared to advocate strong measures lest they be left unsupported.

All 21 of the American republics were represented at Havana, although only ten foreign ministers were present. In all, 44 projects and resolutions, conventions and declarations were presented for consideration; the meeting approved 26 of them, in addition to a convention dealing with European western hemisphere possessions, which required ratification of two-thirds of the American republics before coming into force. Pending this ratification, an emergency measure, the Act of Havana, provided for the setting up of provisional administrations in any European territories where changes of sovereignty were imminent. The act's provisions were to be administered by an emergency committee composed of representatives of each of the 21 republics, but the committee's functions would be transferred to an inter-American committee for territorial administration when two-thirds of the republics had ratified the convention itself. Terri-

tories where sovereignty was in dispute, as the Falkland islands and British Honduras, were specifically exempt.

Along economic lines, attention was given to a proposed huge cartel, but the project failed of support and was never formally submitted. Further resolutions were for strengthening and expanding the activities of the Inter-American Financial and Economic Advisory committee, and for encouraging study of all possible measures for increasing domestic consumption and inter-American trade. Subsequently, under sponsorship of the Financial and Economic Advisory committee, representatives of the 14 coffee-producing republics and of the coffee-consuming United States developed an Inter-American Coffee Quota system, whose details were ironed out and formally approved on Nov. 28 (*see* BRAZIL). Instruments were created for inter-American co-operation in temporary storage, financing, and marketing of all surplus commodities.

A further resolution provided for immediate consultation in the event that any republic was threatened by fifth column activities and requested such action.

Regional Conferences.—Subsequent to the Havana meeting, the Hispanic American republics continued to work for joint action. Argentina and Brazil held consultations from which resulted a trade treaty and in October similar discussions were held by representatives of Argentina, Bolivia, Brazil, Paraguay and Uruguay, with the announced objective of effecting a customs union. Another conference, of republics in the Amazon basin, was called by President Vargas of Brazil. The United States Export and Import bank gave important financial aid through credit grants to several countries.

Preparations for Defence.—In the later months of the year, especially after the United States agreement with Great Britain under which it acquired naval and air base rights in various British territories in America (*see* WEST INDIES, BRITISH), much attention was directed toward proposals for United States acquisition of sites in various parts of Hispanic America as part of the defence program. Rumours of negotiations for bases in Chile, Peru, Ecuador (the Galapagos islands), Costa Rica, Uruguay and other countries were rife at different times, but only in Uruguay did they openly take on an official nature. A proposal that Uruguay grant rights to a base at Punta del Este on the Atlantic coast evoked strong protests from Argentina as well as within Uruguay itself, and although tacitly approved with many reservations by the Uruguayan congress, it had not been crystallized into any definite agreement by the close of 1940. (*See* the articles on individual countries, especially BOLIVIA, CHILE, COSTA RICA, ECUADOR, LATIN AMERICA and URUGUAY. *See also* EUROPEAN WAR.)

Hitler, Adolf (1889–), German statesman, was born at Braunau on the Inn in Austria on April 20. For his early career, *see* *Encyclopædia Britannica*, vol. 11, p. 598. In the so-called Munich Beer Hall Putsch of Nov. 9, 1923, Hitler attempted with Ludendorff, Goering, Frick, Streicher, Roehm and others to seize the Bavarian government, but was arrested, tried for treason, and condemned to imprisonment at Landsberg. Here he dictated to his secretary, Rudolf Hess, his famous book, *My Struggle* (*Mein Kampf*).

It is in part an autobiography and in part an exposition of his ideas for the regeneration of Germany, and is hence sometimes called the "Nazi Bible." On his release from prison in Dec.

"BLACK-OUT," as drawn by Holland in the *Nashville Banner*

1924, as a result of a general amnesty, he devoted himself to building up various organizations to strengthen the Nazi party: Brown Shirts, Elite Guard (*Schutz-Staffeln* or "SS"), Hitler Youth (*Hitler Jugend*) and other formations. With the aid of these, with efficient lieutenants, and with his magnetic oratory, his Nazi party grew rapidly in power, winning 12 Reichstag seats in 1928 and 230 in July, 1932. On Jan. 30, 1933, Hitler was appointed Reich chancellor and began the social and political revolution establishing the "Third Reich." Upon Hindenburg's death Aug. 1, 1934, Hitler succeeded him as president but became known as Reich Leader (*Fuehrer*) and chancellor. He became absolute master of the Reich and succeeded in rebuilding Germany's military might within five years. In 1933 he withdrew from the League of Nations; in 1935 he decreed compulsory military service; the next year he marched into the Rhineland. In 1938 he annexed Austria and, by the pact of Munich, dismembered Czechoslovakia. His last "white conquest" was the absorption of Czechoslovakia and Memel in March 1939; war resulted from his demands on Poland. For events in his career in 1940, *see* GERMANY. (S. B. F.; X.)

Hockey: *see* ICE HOCKEY.

Hogs. A general decline in the swine census began in a number of countries in 1940 and indicated further reductions in supplies of pork in 1941, particularly in Europe. War and scarcity of feedstuffs limited breeding and caused above-normal slaughter of swine in Europe. In the United States unusually large numbers of hogs on farms and a lack of export markets for lard and pork caused declines in both the spring and fall pig crops. At the beginning of 1940 the agricultural department reported 58,312,000 hogs on U.S. farms, compared with 49,293,000 in 1939. The number of pigs saved in the U.S. spring crop in 1940 was 4,007,000 as against 52,343,000 in the spring crop of 1939, a decline

Swine Census in Different Countries in 1940 and 1939

Exporting countries	Importing countries	
	1940	1939
United States	58,312,000	49,293,000
Canada	5,882,000	4,294,000
New Zealand	714,000	683,000
Argentina*	..	..
Australia*	..	..
Ireland (Eire)	1,058,000	943,000
Denmark	3,199,000	2,997,000
Sweden	..	1,579,000
Netherlands	..	1,553,000
Hungary	4,649,000	5,808,000
Yugoslavia	3,503,000	3,451,000
Rumania	..	3,165,000
Eatvia	..	891,000
Lithuania	1,160,000	1,117,000
Estonia	..	442,000

*Argentina had about 4,000,000 hogs in 1937. No figures are available for Australia, a small producer of pork. Italy had 3,940,000 hogs in 1938 and Russia 30,600,000.

about 8%, with a still greater reduction indicated for the 1940 fall crop, as compared with the 1939 fall crop of 31,985,000 pigs. The department of agriculture estimated that slaughter in the hog-marketing year beginning Oct. 1, 1940, would be about 10% less than in the preceding year. U.S. exports of fresh pork during the first year of the war, beginning Sept. 1939, were 45,673,000 lb., a decline of 40%. Exports of lard to the United Kingdom and Europe were reduced drastically, but large increases in exports to Latin America brought the first war year's total of U.S. lard exports to 247,000,000 lb., a decline of only 6% under the preceding year's exports. Pork production in Canada was 14,000,000 lb. in 1939, the largest on record. Preliminary estimates placed 1940 Canadian production at a still higher figure, 15,000,000 lb. Early in the war Great Britain contracted with Canada for unusually large supplies of bacon and other pork products, running to at least 5,600,000 lb. per week, or an annual basis of 291,000,000 lb. up to Oct. 31, 1940. A favourable feed ratio also caused increase in swine breeding in Canada so that in 1940 the hog census had increased to 5,882,000, from 4,294,000 head in 1939, and with the 1940 spring pig crop numbering 5,073,000 compared to 3,640,000 in the spring of 1939. The 1940 fall crop was estimated at between 3,700,000 and 4,700,000, compared to 3,726,000 in the fall of 1939. While supplies of pork were normal in Europe, except in France and Belgium, in 1940, scarcity of hogs and wartime slaughter, it was believed, would substantially curtail supplies in 1941. The table shows the swine census for 1940 and 1939 in different countries as given by the office of foreign agricultural relations of the U.S. department of agriculture. (See also MEAT.) (S. O. R.)

Holland: see NETHERLANDS.

Hollander, Jacob H. (1871-1940), U.S. economist, was born in Baltimore, Md., July 23, was graduated from Johns Hopkins university in 1891, and in 1894 was granted the degree of doctor of philosophy. He was associate professor of finance until 1900; in 1901 he became associate professor of political economy, and full professor three years later. Hollander served as treasurer of Puerto Rico in 1900-01, and in 1905 he was appointed a special commissioner to Santo Domingo to investigate the public debt. In 1907 he was secretary of the bimetallic commission sent to Paris and London to study that question, and from 1908 to 1910 he was financial adviser to the Dominican Republic. In 1931 he was made chairman of the tax survey commission of Maryland. He died in Baltimore, July 9.

Home Building, Federal: see FEDERAL HOME LOAN BANK SYSTEM; HOUSING.

Honduras, a Central American republic; language, Spanish; capital, Tegucigalpa (est. pop., 35,000); President,

General Dr. Tiburcio Carías Andino. The area is 46,332 sq.mi. The population was officially estimated at 1,014,584 in 1939.

Politically, the outstanding feature of the year 1940 was the strong adherence of the country to western hemisphere solidarity principles. Fifth column activities were combatted and in August compulsory military service was established. In March 1940, a new civil code, replacing that of 1898, was adopted. Some improvement was noted over the depressed economic conditions of immediately preceding years. A significant economic development was the beginning of experimental rubber cultivation along the Atlantic coast, where 50,000 trees were planted and land cleared for an additional 150,000 trees.

External communication is by steamship and Pan American Airways. Airlines link Tegucigalpa with coastal points. Honduras has 840 mi. of railway. The 280-mi. Inter-oceanic highway straddles the country from north to south; the 90-mi. Honduran section of the Pan-American highway links it with neighbouring El Salvador and Nicaragua. In 1938-39, \$574,022 were spent on highway construction and maintenance.

Imports in the fiscal year 1938-39 were \$9,703,327; exports were \$9,867,156. The United States supplied 65.3% of imports; Germany, 11.4%; Japan, 6%; and El Salvador, 4.9%. Exports, 90.7% of which went to the United States, were principally bananas (63.3%), silver (17%), gold (7.9%) and coffee (2.5%). In addition to bananas and coffee, corn, beans, rice, sugar, tobacco and potatoes are extensively produced for domestic consumption.

The monetary unit is the lempira, valued at 50 cents U.S. The 1940-41 budget estimated revenues and expenditures at \$5,424,000 each and allotted \$1,097,000 and \$552,500 respectively to national defence and education. According to the latest official estimates (1936), there are 965 elementary schools with 33,461 pupils, 93 secondary schools with 2,857 and two normal schools. The Central university of Honduras is at Tegucigalpa.

Hooper, Franklin Henry (1862-1940), editor emeritus of *Encyclopædia Britannica*, was born Jan. 28 at Worcester, Mass. After graduating with high honours from Harvard in 1883 he joined the staff of the Century company and was an editor of the *Century Dictionary* until 1896. He then became literary adviser and manager for the publishing house of James Clarke and Company. His association with *Encyclopædia Britannica* began in 1899, when he became an editor. He was associate editor of the 10th edition (1902), managing editor of the 11th edition (1910-11) and American editor of the 12th, 13th and 14th editions (1922, 1926 and 1929 respectively). From 1932 until his retirement in April 1938 he was editor-in-chief. Mr. Hooper also edited *These Eventful Years* (1924), *The World Today* (1933-38), the first *Britannica Book of the Year* (1938) and *Britannica Junior*. He was accidentally killed by a truck near Saranac Lake, N.Y., on Aug. 14.

Hops. Reduced acreage in Germany and Yugoslavia, labour shortage in England and war effects in France and Poland materially decreased the 1940 hop crop in Europe. In the U.S. the estimated crop of 40,260,000 lb. was 2% larger than 1939 production of 39,380,000 lb. and 17% above the ten-year (1929-38) average of 34,100,000 lb. In Germany the 1940 crop was estimated at 34,000,000 lb. from 34,000 ac., compared with 37,000,000 lb. from 35,500 ac. in 1939. In England the 1940 crop was estimated at 27,000,000 lb. from 18,500 ac., compared with 29,500,000 lb. from 18,800 ac. in 1939. The Protectorate (Bohemia and Moravia) 1940 harvest was 5,800,000 lb. from 7,400 ac., compared with 8,500,000 lb. from 10,000 ac. in 1939. Yugo-

U. S. Production of Hops, 1940 and 1939

	1940 lb.	1939 lb.	1929-38 average lb.
Oregon	18,620,000	19,300,000	18,295,000
Washington	11,700,000	9,212,000	7,353,000
California	9,940,000	10,868,000	8,662,000

slavia's 1940 crop was 3,700,000 lb., from 7,450 ac., compared with 4,000,000 lb. from 7,260 ac. in 1939. In northern France (Alsace, Burgundy and Lorraine) war caused general neglect of the hop yards and the 1940 harvest was estimated at from 2,000,000 lb. to 2,500,000 lb., less than half the 1939 crop. About 25% to 30% of the Polish hop production area was under German domination and the harvest there was estimated at from 1,000,000 to 1,500,000 lb., the U. S. department of agriculture reported. No figures were available from Russian-held areas of Poland.

Horne, Robert Stevenson Horne, 1ST VISCOUNT (1871-1940), British statesman, was born in Slamannan, Scotland, Feb. 28, and died in Surrey, England, Sept. 3. For a biographical sketch see *Encyclopædia Britannica*, vol. 11, p. 752.

Horner, Henry (1878-1940), governor of Illinois, was born in Chicago, Nov. 30, and was graduated from the Chicago-Kent College of Law in 1898. He practised law from 1898 to 1914, when he became probate judge for Cook county. He was elected governor of the state on the Democratic ticket in 1932 and was re-elected in 1936. He had been ill for two years when he died in Winnetka, Ill., on Oct. 6.

Horse Racing. During 1940 new records were established in the United States and Canada in numerous different departments of turf affairs. Racing being a year-round sport, it proceeded continuously from Jan. 1 to Dec. 31, allowing only for the Sabbath intermissions—while at New Orleans, La., during the winter, and just over the border at Agua Caliente, Mexico, it proceeded on that day as well.

While the gross number of races run through the year fell short of that for 1939—to wit, 16,443 as against 16,966—the gross amount of money awarded in stakes and purses increased—namely, \$15,911,167 as against \$15,312,839. The number of different individual thoroughbreds that competed also increased, rising above 14,000 as against 12,804 for 1939. These marked new “highs” in both instances. As previously recorded, the latter-day legalization of race-track betting throughout the country has been chiefly responsible for such gains and in 1940 a further step was taken in that direction when for the first time the “totalizators” (betting machines) were introduced in the state of New York, after a prolonged struggle to keep them out. The result was a large increase in both the amount of money disbursed there and the popular support of the sport, the volume of betting reaching such heights that the tax paid into the state treasury exceeded \$6,000,000. No new courses or meetings of any importance marked the season, but 1941 will see the return of New Jersey to activity after a long recession, with several plants of the first magnitude which with little doubt will effect a further upward swing in racing's gross returns.

From the standpoint alike of money value and sporting importance, the great event of the year was the \$100,000-added Santa Anita handicap, run on March 2 and won by the seven-year-old

stallion Seabiscuit, he thereby making himself the world's largest money-winning race horse with a net total of \$437,730 and being the first and only one of any country to reach or pass the \$400,000 mark (previous leader Sun Beau, \$376,744). Seabiscuit is owned by Charles S. Howard of San Francisco, whose stable during the season won \$333,870, or almost double as much as the one standing second, that of Mrs. Payne Whitney (\$174,405).

The leading individual race horse was the three-year-old Bimblech (\$110,005), owned by Colonel E. R. Bradley of Kentucky. Mr. Howard's three-year-old Mioland was second with \$98,500, and the same owner's Seabiscuit third with \$96,850; the horse last named being permanently retired immediately after his victory at Santa Anita. The leading two-year-old money-winner was Whirlaway, with \$77,275, he being owned by Calumet farm (Warren Wright) of Kentucky. The Kentucky Derby remained the most brilliant and colourful turf event of the season from the popular side and was won by Gallahadion, owned by Mrs. Ethel V. Mars of River Forest, Ill. Through his performance his sire, the French-bred stallion Sir Gallahad 3rd, became for the fourth time the premier money-winning sire, with a total of \$304,705, having previously taken the same rank in 1930 and again in both 1933 and 1934. He was imported in 1925, is owned by a syndicate and stands at the Claiborne stud in Kentucky. All told, his offspring have won over \$2,000,000 on the American turf.

The leading money-winning trainer was Thomas Smith of the Howard stable, with a total of \$268,950. The leading racing-winning trainer was D. Womeldorf, with a credit of 108. The race for riding honours was the closest ever known and not decided until Dec. 31, when Earl Dew closed with a total of 287 winners and W. L. Taylor with 286.

From the purely racing standpoint the feature of the season was the revival of long-distance contests, which came to a climax with the \$50,000-added New York handicap at 2¼ mi., a new event run at Belmont park, N.Y., and won by the four-year-old gelding Shot Put, owned by Mrs. Marie Evans of Chicago. Through the season he earned \$72,945, chiefly in long races.

Harness Turf.—The season of 1940 was extremely successful and marked further gains for this, the typically U.S. form of horse racing. The “horse of the year” was the three-year-old Spencer Scott (1:59½), winner of seven out of eight starts, at the principal events for his age but one, and over \$40,000. He is owned by C. W. Phellis, Greenwich, Conn.; driven by Frank Egan. The mature champion Greyhound (1:55¼), eight years old in 1940 and before the public for seven consecutive seasons, further distinguished himself by winning every race in which he was started and then, when started, beat the existing saddle record for trotters (2:05¼), lowering it to 2:01¾; he was ridden by the late amateur Mrs. Frances Dodge Johnson. The outstanding pacer of the year was the three-year-old Fearless Peter (2:00), winner of 16 races out of 17 starts. He was in 1940 owned by Dr. L. T. Guilinger of Andover, O., and was driven by Dr. H. M. Parsha (J. L. HE.)

Great Britain.—Although the flat-racing season of 1940 in Great Britain was confined to rather less than three months, apart from a few meetings in the north and midlands, it was four possible to decide four substitute classic races, all of which were run on the summer course at Newmarket. English-bred colts failed in both the Two Thousand Guineas and the New Derby, each of which was won by a horse bred in France. Djebel, owned by M. Marcel Boussac and ridden by E. C. Elliott, gained an early victory in the Two Thousand Guineas, but could not be sent over to England again for the New Derby, which was won by Pont l'Évêque. This colt was owned and trained at Beckhampton by F. Darling and was ridden by S. Wragg. Pont l'Évêque would almost probably have won the substitute St. Leger at Hurst park if it had

It been necessary to abandon the fixture. The outstanding filly of the year was E. Harmsworth's Godiva, whose success in the Thousand Guineas and the New Oaks stamped her as a high class three-year-old. Godiva was trained by W. R. Jarvis and was ridden on both occasions by the apprentice rider, D. Marks. She was afterwards sent to race in Ireland, but met with an accident and had to be destroyed. Her untimely death was a severe blow to the thoroughbred industry. Gordon Richards once again made more winners than any other jockey.

The national hunt season also suffered to a large extent from enforced curtailment, but it was found possible to hold the Grand National as usual at Aintree. The winner was Bogskar, an out-bred owned and trained by Lord Stalbridge, a steward of the National Hunt committee. Macmoffat finished second for the second year in succession. The most successful jockey of the season was T. F. Rimell. (A. K. B.)

Horses. The steady decline in the number of horses and mules in the United States in 1940 was at a substantially reduced rate compared with that of previous years, mainly because of a check on ravages of equine diseases (particularly sleeping sickness or equine encephalomyelitis) but partly because of reduced buying of tractors by farmers. (See FARM MACHINERY.) The number of horses in the United States at the end of 1940 was 2,500,000, mules 4,150,000, as estimated by Wayne Dinsmore, secretary of the Horse and Mule Association of America. This represented a decline of about 200,000 horses and 150,000 mules. In Jan. 1, 1940, the number of horses on United States farms was estimated by the department of agriculture as 10,616,000; mules 4,321,000. The Horse and Mule Association of America announced that sleeping sickness had practically been eradicated in 1940 through widespread vaccination of horses and mules. Only 8,008 cases of equine encephalomyelitis were reported in 1939, whereas there had been 184,622 in 1938 and 170,000 in 1937, with a mortality of, respectively, 25% and 21%. The war in Europe resulted in a more active market for cavalry horses in the autumn of 1940. In the spring of the year the French government bought 7,000 horses in the United States. None was shipped abroad, however, and in July all were sold at reduced prices. The U.S. army bought 2,000 pack mules and 600 riding horses, and later, in October, was authorized to purchase 19,812 more riding horses. The U.S. army paid \$170 per head for riding or artillery horses. The price included the mileage of the purchasing board which visited different markets to obtain horses. About \$200 per head was paid for pack mules. U.S. army officers reported that the German army had 791,000 horses in active army service as of June 1940, and not including horses used in the service of supplies. Of this number 406,000 horses were used by the German army to draw artillery. (See also LIVESTOCK; SHOWS.) (S. O. R.)

Horse Shows: see SHOWS.

Horticulture. Europe's war had in 1940 a disastrous effect on horticultural conditions in every civilized country. The regular flow of seeds, bulbs, fertilizers and insecticides was entirely disrupted, and some items were taken off the market. The bulb industry was particularly hard hit, with the result that importations to the United States from Holland entirely ceased. This condition served to stimulate the growing of the so-called Dutch bulbs in the United States, particularly in the northwestern section, but the supply available in 1940 from domestic sources was wholly inadequate. This was true especially of tulips, the supply in the United States in 1940 being hardly more than 10,000,000 bulbs, as against 100,000,000 normally

STUDENTS OF CONNECTICUT COLLEGE FOR WOMEN conducting experiments of plant nutrition in 1940

imported from Holland. Moreover, 90% of the domestic bulbs consisted in 1940 of forcing varieties, such as William Copeland and William Pitt. Very few good garden tulips could be obtained at the planting season in the autumn of 1940. English growers rather unexpectedly offered to ship tulip bulbs to the United States, and a few thousand English bulbs came over, but there were not enough to make an impression on the market. Some lots went down on ships that were sunk.

The daffodil situation was much better. The number of daffodil bulbs produced in the U.S. goes far toward supplying the market. Most hyacinth bulbs are imported and the number available in 1940 was small. Such miscellaneous bulbs as scillas, muscari, crocuses and snowdrops were available only in limited quantities, although the growing of these bulbs is an industry which is making progress in Michigan.

England has been producing many bulbs in recent years, but has also been Holland's best customer. English growers had to readjust completely their planting operations. Indeed, this was true of all persons engaged in horticultural pursuits in the British Isles, except in Ireland, where commercial rose growing continued without much interference.

Every effort was made to maintain horticulture on a liberal scale in England because of its value in maintaining morale, but there was an ever-growing tendency to substitute food crops for ornamental plants. Amateur garden makers were encouraged to grow both vegetables and flowers. Commercial establishments were maintained, although great damage was suffered because of bombing by the Germans. Garden makers throughout the world learned with regret that the famous Kew gardens near London was severely damaged by bombs, some of the greenhouses being wrecked and many valuable plants destroyed.

It has been impossible to ascertain just what conditions prevail on the European continent. Word has come out of Holland that most of the bulb fields escaped ruin when the country was invaded, but there is reason to believe that at least a part of the area usually devoted to tulips was taken over for the growing of food crops. In any event, the financial loss from the inability of the Dutch growers to sell their bulbs was heavy.

In former years a great many prepared lily-of-the-valley "pips" were sent out of Germany, but of course their exportation largely ceased. United States growers were in 1940 beginning to produce them on a large scale.

Canada's situation was much like that of the United States in 1940 as far as imports from Europe were concerned. Yet it was in a much better position than England and the continental countries because much of the horticultural material it needed was available from the U.S. In peacetime the dominion gets 98% of its tulip bulbs from Holland. Of the 32,000,000 bulbs of other kinds formerly imported, 25,000,000 came from Holland and 3,000,000 from France, Belgium, the Channel islands and Germany. Canadian gardeners will have to do without most of this material in 1941.

The seed situation was exceedingly complicated because of wartime conditions. Few persons realize the extent to which most of the European countries are drawn upon for seeds of different kinds, particularly vegetable seeds. There is not likely to be any serious shortage in the United States except in a few lines, but conditions in the European countries seemed in 1940 less promising. Horticulturists in Finland made an appeal to the United States for vegetable seeds, and large quantities were sent to

Finland from private sources through the Finnish consul in New York city.

The importation of grass seed practically stopped. In former times a large amount of grass seed came from Czechoslovakia, Poland, Hungary and Denmark. The last-named country was, indeed, one of the world's most important sources of grass seed. As it happens, a considerable shipment of seed from that country was afloat when the invasion took place. Some grass seed is to be obtained from New Zealand and Australia, but six weeks are required to make the trip from these countries to the United States and the tropical heat affects germination harmfully unless refrigerated compartments are used. Some seed came intermittently from Scotland and Ireland.

Perhaps the most noticeable shortage of seeds and of plants grown from seeds has to do with herbs for medicinal purposes. Measures were being taken in 1940 to increase the production of medicinal herbs in the United States, but much higher prices for many items appeared to be a certainty.

The matter of vegetable seeds, including herbs, is of particular importance because it seemed likely that more vegetable gardens would be made in 1941 in the United States as well as in Europe than at any time since the war of 1914-18. The National Garden bureau, an organization supported by U.S. seedsmen, concentrated in 1940 on what were called "gardens for defence," urging that amateurs throughout the country make vegetable gardens in 1941.

An effort to stimulate the canning of vegetables and fruits in the autumn of 1940 failed to gain impetus when the fact was discovered that large surpluses of canned goods were to be found in the storehouses of commercial establishments.

The cost of ocean freight, plus the high war risk insurance, made the exportation of canned vegetables almost prohibitive, although there was a steady if limited flow of vegetable products to the British Isles.

One of the most interesting and progressive horticultural developments of 1940 was the growing use of a synthetic hormone solution to prevent what is commonly known as the preharvest drop of apples.

It has been found that this drop can be largely controlled by spraying the fruit a week or two before harvest with a weak solution of naphthaleneacetid.

Much experimental work was being done to determine what results might be obtained from the use of vitamin B₁, colchicine and other synthetic substances. This work was being carried on in many of the colleges and experimental stations, much of the work being in the hands of the students.

(E. I. F.)

Hospital Book Guide: see AMERICAN LIBRARY ASSOCIATION.

Hospitals. In 1940, the war affected hospitals in all countries—cost and accessibility of supplies, mobilization of staff and personnel and, in some cases, destruction of property. British hospitals for 1940 were carried on under almost insuperable difficulties. As a result of the steady and indiscriminate bombing of civilian areas, more than 25 hospitals in the

London area alone were struck by bombs in 1940 and many patients, doctors and nurses were killed. The minister of health stated that no feature of London's superb resistance surpassed the way in which the hospitals were performing their duty.

Some of the hospitals established surgical units completely underground where the surgical work could go on uninterrupted by air raids. Voluntary hospitals in London were taken over under the emergency situation. Under the Essential Building and Plant act and the Personal Injuries act, hospitals regarded as essential might obtain loans from the government for rebuilding, and employees, within certain limitations, might receive compensation for injuries sustained by, or in repelling, enemy attack. One outcome of the war was the closer linking of voluntary hospitals and the closer co-operation between voluntary hospitals and the government. During 1940 the British dominions sent several fully staffed and equipped military hospitals to Great Britain. A group of the princes of India also completely outfitted a large hospital ship.

Although the United States was not actually engaged in conflict, its preparedness program involved the hospital field. The health and medical committee of the council of national defense had a strong subcommittee on hospitals charged with the task of mobilizing civilian hospital facilities and personnel for national welfare. The American Hospital association conducted a national survey of hospital resources. The U.S. army set up 17 surgical, 17 evacuation and 32 general hospitals.

Construction.—Among the new buildings reported in 1940 were a 500-bed Royal Melbourne hospital in Australia; the University hospital at San Juan, Puerto Rico; the model 1,200-bed Sodersjukhuset at Södertälje, Stockholm; and the 800-bed Dunedin Public hospital in New Zealand. A well-designed hospital for 1,500 chronic disease patients was built on Welfare island, New York city. The Palestine government built at Haifa what has been described as the finest hospital in the near east. For the war against cancer the new 12-story Memorial hospital in New York city is an outstanding institution, as is also the smaller Ellis Fischel State Cancer hospital at Columbia, Mo. Among the military hospitals one of the finest erected was that of the Canadian Red Cross society at Cliveden (Taplow) in England. In China, despite severe war conditions General Chiang Kai-shek contributed extensively towards hospital construction and maintenance.

Finance.—Of wide interest has been the Nuffield trust (England), a fund of £1,250,000 to create a central hospital fund designed to promote better regional co-operation and control among voluntary hospitals following the recommendations of the Sankey commission. In this connection there would seem to be a trend towards amalgamation in Great Britain.

In the past few years Birmingham, Liverpool, Sheffield and Bristol, for instance, completed or initiated amalgamation plans. In the United States of America the remarkable growth of the prepayment plans for hospital care created an increasingly satisfactory source of revenue for hospitals.

Equipment.—Perhaps the most important development was the introduction of electrically conductive rubber for flooring, casters and other purposes. Anaesthetic explosions in many instances were traced to the accumulation of static potential. By permitting the dissemination of this potential through grounding, considerable lessening of the hazard was anticipated.

Legislation.—The National Hospital act of 1940 in the U.S.A., passed by congress, would authorize not only an initial appropriation of \$10,000,000 to build needed rural hospitals but a similar amount for each of five more years for maintenance and construction. A strong national hospital advisory council of six, representing medical and hospital authorities, will advise as to need and will outline and supervise standards of service.

In Australia, motor accident insurance legislation in Victoria, compulsory on all motor cars, will do much to protect hospitals and professional people supplying service.

Education.—The report of the commission on graduate medical education (U.S.A.) was a definite contribution towards clarifying policies of graduate and medical education. Trends in internship and in residency were analyzed and appraised.

International.—Latin-American relations were advanced by the first Latin-American Hospital congress at Santiago de Chile. Thirteen South American countries were represented in this first triennial congress. Pan-American relations were advanced by the issuance of *El Libro Hospital Moderno*, a valuable reference book on hospital topics, by publishers of *Modern Hospital*. Covering a wide range of subjects, its contributors include the leading authorities in the United States and Central America. There was also a successful institute on hospital administration at Puerto Rico.

(G. H. Ag.)

MOBILE HOSPITAL demonstrated by the U.S. army medical corps in 1940. Tent shelter encloses the rears of two trailers—one a sterilizer and one the operating room—making them a unit.

Housing. The year was one of solid progress in public housing in the United States, achieved by a growing number of Local Housing authorities operating with aid from the United States Housing authority and by the Farm Security administration experimenting on various angles of the difficult agricultural housing problem. Congressional provision for a continuous program in urban slum clearance was in 1940 still lacking. The urgency of housing for national defence workers deflected federal appropriations to that field. Many phenomena of 1915 to 1918 were repeated. Bottlenecks appeared in production for lack of workers, who could not be supplied from a distance for lack of housing. Local builders produced houses by the dozen where they were needed by hundreds.

The 1940 emergency found the United States better equipped, administratively and psychologically, to grapple with its defence housing needs than it had been in 1917. Those needs were recognized at the start, their co-ordination provided for under the national defence advisory commission and federal funds were promptly made available.

Of 200,000 new family units needed for workers transplanted to carry out the national defence program, it was still hoped at the end of 1940 that private enterprise would provide more than half. Part of the remainder the army and navy departments were building themselves. The Public Buildings administration of the Federal Works agency was specializing in demountable houses for temporary developments where there was reason to expect a continued need after the period of emergency. Local housing authorities, with the assistance of USHA, were carrying out programs where the developments could be fitted into permanent local needs.

The earliest authorization by congress at the end of June permitted operation of USHA and local housing authorities with either the war navy department, to provide housing for their married enlisted personnel or civilian workers out of funds already at the disposal of USHA. This authorization was of special value as a demonstration of speed by already acting agencies. Several of these projects, built by workers on two shifts, were already being tenanted in December. In early September 100,000,000 for housing was made available to the war and navy departments for the fiscal year 1940-41, while the Lanham act, approved Oct. 14, provided \$150,000,000 more to be disbursed by the Federal Works agency to relieve housing shortage impeding national defence industries, the administrator to delegate the carrying out of these purposes to any appropriate federal or local public agency.

About \$290,000,000 thus became available from public funds for defence housing. To Dec. 18, 1940, allocations had been made for 46,405 dwelling units, of which more than 20,000 were under construction.

Meanwhile, the regular slum clearance and rehousing program under the United States Housing act of 1937, undertaken by local housing authorities, with the assistance of the United States Housing authority, was passing rapidly to the construction and occupancy stages. Although congress had not yet provided for expansion of the program beyond 1938 authorizations, was found possible, by various economies and recoveries, to increase the total number of dwelling units to be built from 160,000 to about 193,000. Before the end of the year there were loan contracts and earmarkings outstanding for the 525 USHA-aided projects in 234 localities in 37 states and territories (excluding army or navy-leased defence housing), with a total anticipated development cost of \$770,170,000.

USHA-Aided Local Authorities' Projects (Dec. 19, 1940)

	Under Loan Contract	Under Construction
Total number of projects	489	337
Total number of localities	221	172
Total number of dwelling units	158,234	115,552
Average over-all cost of new housing per unit	\$4,382	\$4,308
Average net cost of dwellings per unit	2,857	2,717
Average net cost of dwellings per room	679	646

Approved rents and incomes:

North: Monthly shelter rent per unit \$14.77; Annual family income \$910
South: Monthly shelter rent per unit \$10.06; Annual family income \$651
 Number of projects occupied or partially occupied, 125 in 81 communities.
 Total number of dwelling units occupied, 35,130.

New York state, operating with its own funds, had under construction alongside the Brooklyn navy yard the largest slum clearance and rehousing operation so far undertaken in the United States, to shelter 3,528 families.

The city of New York, also acting independently, used the proceeds of a special tax to build Vladeck city houses on a slum-cleared site and had other small projects under way.

The work of the Farm Security administration, U.S. department of agriculture, in the field of rural housing during 1940 falls under four heads:
 (1) **Rehabilitation Program.** More than 850,000 low-income farm families were being helped by loans and otherwise to organize their farm operations on a more efficient basis. Incident to this program by the end of 1940,

THE SOUTH SECTION of huge "Parkchester" in New York city was opened in the spring of 1940

about 39,000 sanitary privies had been constructed, 17,900 water supplies protected and 27,350 houses screened. (2) **Tenant Purchase Program.** Loans were made to more than 12,000 tenant farm families to enable them to purchase farms of their own. To June 30, 1940, 5,063 new homes were built in connection with this program and 6,794 existing houses repaired. About 2,900 more new homes were being built during the fiscal year. (3) **Homestead Development Program.** Under the supervision of FSA were 164 homestead developments, intended to give over 15,000 low-income farmers a new start on good land. Ownership was being transferred to the residents as fast as possible. (4) **Migratory Labour Camps.** The purpose is to provide temporary shelter and sanitary facilities for migratory farm labour families. A typical camp consists of a group of community buildings containing washrooms, laundries, showers, toilet and other facilities surrounded by tent platforms, one-room shelters and larger houses. Accommodations for 12,509 families had been provided in 1940. Considerable expansion of these facilities was being planned.

Walker and others, *Urban Blight and Slums* (1938); National Association of Housing Officials, *Housing Yearbook* (1940); Special Housing number *Survey Graphic* (Feb. 1940), Publications of the United States Housing Authority and of the Farm Security Administration. (E. E. W.)

Great Britain.—There was an almost complete cessation of house building during the year 1940, both by municipal authorities and by builders who normally produced small middle-class houses on a speculative basis. One of the most important contributory factors was the difficulty of obtaining adequate materials. Most of the basic materials had been taken over for building of a wartime nature and this, together with the shortage of some of them, made private building more difficult almost from day to day. At the end of 1940 there was complete control over all forms of building, and private enterprise was limited to an amount which could be covered by a cost of not more than £500. This regulation alone practically ruled out any form of house building.

Before this last regulation came into force the shortage and control of timber was the main cause of the closing down of house building. Many experiments were made in the use of other materials to take its place—roof construction in small buildings being the chief problem. Although many systems and substitutes were advocated there were very few, if any, which were found to take the place adequately and economically of the customary structural timber used on a small scale.

Added to other difficulties was the need for the provision of accommodation for workers in newly-created industrial areas, and in view of the fact that many of the new industrial areas were likely to exist only during wartime and that accommodation had to be found urgently there was little attempt to link up the satisfaction of this need with any long-term policy in housing.

The Royal Institute of British Architects launched a competition for designs for small houses which would serve a wartime purpose and could be built with wartime materials and which could, when peace arrives, be enlarged or otherwise adapted to normal peacetime living. A number of interesting designs was submitted, many of them of great ingenuity, but the general result gave the impression that the housing of people in a locality of mushroom wartime industries under wartime conditions presented a problem which bore little or no relation to normal times.

The demolishing by enemy action of many of the poorer types of buildings in certain parts of London, tragic indeed as it is, with all its attendant hardships, at least gave encouragement to those interested in the betterment of housing generally to work for something far better and more human to take their place in the future.

The problem of areas which should have been abolished long ago was in many cases solved by the activities of the enemy who cleared sites ready for something finer for the future. (See also PUBLIC HEALTH ENGINEERING.) (F. R. Y.)

Houston, David Franklin

(1866-1940), U.S. educator, economist and statesman, was born in Monroe, N.C., Feb. 17. After graduation from South Carolina college in 1887, he served there as a tutor for a year, then became superintendent of schools in Spartanburg, S.C. In 1894 he joined the faculty of the University of Texas in the political science department, rising to the rank of president of the university in 1905 after a term as president of the Texas Agricultural and Mechanical college. In 1908 he was elected chancellor of Washington university, St. Louis, holding that post until 1916. In the meantime he had entered President Wilson's cabinet as secretary of agriculture; he was also secretary of the treasury in 1920-21. On his retirement from the cabinet in 1921 he was made a vice-president of the American Telephone and Telegraph company. In 1930 he was elected president of the Mutual Life Insurance company, holding that post until the end of 1939, when he became chairman of the board. He wrote *Eight Years with Wilson's Cabinet* in which he defended the president from attacks made upon his record. He died in New York city, Sept. 2.

Howe, Frederic Clemson

(1867-1940), U.S. lawyer. was born in Meadville, Pa., Nov. 21, and was graduated from Allegheny college in 1889. He studied at Halle, Germany, at the University of Maryland law school and the New York Law school. Admitted to the bar in 1894, he practised in Cleveland, Ohio, until 1909. He investigated municipal ownership in Great Britain for the United States government in 1905 and served in the Ohio senate from 1906 to 1909. He became professor in the Cleveland College of Law and lecturer on taxation at Western Reserve university, and from 1906 to 1909 he lectured in the University of Wisconsin on municipal administration. From 1914 to 1919 he was commissioner of immigration at the port of New York. In 1933 he was appointed consumers' counsel for the AAA and in 1935 he was made adviser to the secretary of agriculture. He wrote many books on municipal government, systems of taxation and other governmental subjects. He died in Oak Bluffs, Mass., Aug. 3.

Howland Island: see SOUTH SEA AND EQUATORIAL ISLANDS.

Hungary.

A kingdom in central Europe, although since the breakdown of the Habsburg monarchy in 1918 the throne has remained vacant. Chief of state was in 1940 the regent, Admiral Nicholas Horthy. While the kingdom of Hungary before 1918 had an area of 125,402 sq.mi. with a population in 1910 of 20,886,487, of whom only a little less than half (10,050,575) were Magyars according to the official Hungarian census, the treaty of Trianon in 1920 separated from Hungary most of the parts inhabited by non-Magyar populations, so that Hungary was reduced to an area of 35,875 sq.mi. with a population of 7,980,143 in 1920. Since 1938 Hungary regained some of the territory lost after the war of 1914-18. She gained from Czechoslovakia through the award of Vienna on Nov. 2, 1938, about 4,630 sq.mi. with roughly 1,000,000 inhabitants, and in March 1939, Ruthenia with about 720,000 additional inhabitants. Finally a second award of Vienna on Aug. 30, 1940, gave to Hungary the northern part of Rumanian Transylvania, with about 2,500,000 inhabitants and an area of 17,000 sq.mi. At the end of 1940, Hungary thus had about 57,000 sq.mi. with a population of 13,500,000.

This territorial aggrandizement of Hungary was achieved entirely under axis protection. Hungary under Prime Minister Julius Gömbös (who died in 1936) had already instituted a semi-fascist regime in her internal affairs; in her foreign policy Hungary leaned more and more towards the axis powers, and in

1939 officially joined the anti-comintern pact and resigned from the League of Nations. This fascist line in her internal and her foreign policy was continued and accentuated during 1940, although parliament continued to function in both its branches, the hereditary house of lords and the elected lower chamber. The strong pro-fascist government majority was faced with a not inconsiderable and extremist opposition of several out-and-out National Socialist groups, which used as their symbol the cross and arrow instead of the swastika. The leader of the extreme National Socialist Major Ferenc Szalasi, was released from jail, but his movement was inferior in importance to the party of Hungarian Renovation, which was founded by former Prime Minister Imredy and joined by the former minister of defence, General Ratz. There was little difference between the official policy and that of the National Socialist opposition. The official policy insisted upon certain formal independence of Hungary, while the opposition demanded an acceleration and radicalization of the fascist measures initiated by the government. In that situation anti-Semitism, officially initiated in 1938 by an open legislation of discrimination against Jews, grew rapidly and the elimination of Jews from the political and economic life of the country was completed in 1940. Individual legislative measures followed each other quickly, and in Oct. 1940 the last vestiges of the former liberal regime disappeared, when the Jewish faith was deprived of its spiritual representatives in the house of lords. The bill made a special point in declaring that the political, economic and social status of Hungarian Jews had so fundamentally changed that a representation of their interests was no longer feasible.

In foreign policy Hungary completely followed the line dictated by Germany. She was continually in strained relations with Slovakia and with Rumania. The Slovakian and the Hungarian governments voiced mutual recriminations about the maltreatment of their respective minorities. As regards Rumania, Hungary pressed claims for the restitution of territory with greater and greater insistence. The annexation of Bessarabia by the soviet union started the ball of Rumanian dismemberment rolling. Hungary and Rumania negotiated for several weeks. Hungary demanded the larger part of Transylvania, while Rumania insisted that Transylvania was predominantly inhabited by Rumanians and had been the original home of the Rumanian national renaissance. Finally Germany and Italy invited the Hungarian and Rumanian statesmen to Vienna, and there on Aug. 30, 1940, awarded to Hungary, against violent Rumanian protests, the northern part of Transylvania, with the strategic Carpathian border against the soviet union. This settlement was not regarded as definitive either by the Hungarians, who continued their claim for all of Transylvania, or by the Rumanians, for whom Transylvania was much more an integral part of Rumania than Bessarabia or the Dobruja. In spite of Rumanian opposition, the Hungarian army, led by Admiral Nicholas Horthy on the traditional white charger, started the occupation of Transylvania on Sept. 5, which was terminated by Sept. 13. Hungary acquired important timberland and the large cities of Oradea (Grosswardein) and Cluj (Klausenburg). The University of Cluj, which had been a Rumanian university since 1920, was Magyarized. The newly-acquired territory of Transylvania was represented in the Hungarian lower house by 63 deputies, of whom 44 will be Magyar, 17 Rumanians and 2 Germans; the Rumanian deputies, however, will take their seats in parliament only after a similar treatment has been accorded to the Hungarian minority remaining in Rumania.

On Nov. 20 the Hungarian foreign minister, Count Stephen Csáky, signed in Vienna a protocol by which the country joined the German-Italian-Japanese pact of Sept. 27, 1940, a pact which represented a revival of the anti-comintern pact concluded among

the same powers and joined by Hungary already in Jan. 1939. The decision of Hungary to this pact was announced as the first step towards a great and inclusive broadening of the pact as the basis of a new world order, but in addition to Hungary only Slovakia, a German protectorate, and Rumania, which had meanwhile become only a German vassal state, joined. Hungary found herself thus reduced to a position of equality with Slovakia and Rumania, and this position became manifest when towards the end of 1940 German troops moved freely through Hungary into Rumania and towards other Balkan destinations. It was at the suggestion of the axis powers, especially Italy, that Hungary tried to arrive at an understanding with Yugoslavia. Count Csáky went at the beginning of December to Belgrade where he signed a treaty of friendship with Yugoslavia. (See also BALKAN ENTENTE; RUMANIA.) (H. Ko.)

Hurdling: see TRACK AND FIELD SPORTS.

Atton, Maurice (1856-1940), principal emeritus of University college of the University of Toronto, was born in Manchester, England. He was educated at Worcester college, Oxford. He was a fellow of Merton college, Oxford, 1879-86. In 1880 he became professor of classics in University college and was made principal of the college in 1891. He translated Tacitus for the Loeb Classical library and wrote *The Greek Point of View* and several other books. He retired in 1928 and died in Toronto, April 5.

Ice Hockey. It is estimated that nearly 5,000,000 persons saw professional and amateur hockey games in the U.S. during 1940, and that a total of nearly \$8,000,000 went to pay for admissions, salaries and new equipment.

The New York Rangers became the world's champions in big-league professional circles by defeating the Toronto Maple Leafs in the final play-off conducted by the National Hockey league. The Rangers captured four of the seven principal trophies awarded for previous "bests" to the team or to individual players, including the Stanley cup, the William MacBeth trophy, the Calder trophy and the Georges Vezina trophy. The Boston Bruins, first place winner in the N.H.L., captured the Prince of Wales trophy. Schmidt, of the Bruins, led in the league's scoring, with 52 points. Hockey set a fast pace in the minor (professional) leagues. In the International American Hockey league, the Providence team won in the eastern division, and the Indianapolis team led in the western division. In the American Hockey association, the St. Louis team took the crown. In the Pacific Coast Hockey league, the Vancouver team won premier honours.

The Baltimore Orioles took a six-game lead to capture the title of the Eastern Amateur Hockey league and gained possession of the James J. Walker trophy of New York. Other winners in the league were the New York Rovers, capturing the Atlantic City boardwalk trophy and the Hershey Challenge trophy. Another noteworthy feat was the victory of the United States over Canada in the Hamilton B. Wills International trophy, won in a closely contested series that was decided by one game, the scoring being 10 points for the U.S. team and 24 for the Canadians. In the Metropolitan (N.Y.) Amateur Hockey league, the title went to the Exchange Brokers team. The New York Amateur Hockey association championship was won by the St. Nicholas Hockey club.

In the Quadrangular Hockey league, Yale won the championship. The national Amateur Athletic union ice hockey championship was won by the University of Minnesota, defeating the Rock-Hall Hockey club in the finals, at Lake Placid, N.Y. The University of Toronto, capturing the Canadian inter-col-

legiate crown, led the way in Canadian hockey in 1940, winning the International Inter-Collegiate Hockey league title, one point behind McGill, with Yale third. The Allen cup, emblematic of the amateur championship of Canada, was won by the Blue Devils of Kirkland Lake, Ont., when they defeated the Calgary Stampeders in three straight games. (J. B. P.)

Iceland, island kingdom of northwest Europe, hereditarily united with Denmark, in the north Atlantic ocean, touching the Arctic circle; area, 39,709 sq.mi.; population (1939), 120,264. Capital and only large town, Reykjavik (pop. 1939, 38,219). Language, Icelandic; religion, Lutheran Christian.

History.—An independent and sovereign state since Dec. 1, 1918, Iceland retained connection with Denmark by recognizing Christian X as its king, and by using the Danish diplomatic service when necessary.

In 1940 the Icelandic parliament (Althing) was in session when the Germans invaded Denmark (April 9). That same day the united Althing protected the country's interests by entrusting the executive power to the ministry of Iceland "for the time being," and by declaring that Iceland would care for its own foreign affairs and fisheries inspection. A coalition ministry of five members signs acts of the Althing before they become law, and at least three must agree on any measure taken in the name of the royal power. Iceland had in 1940 appointed chargés d'affaires in London, Stockholm and Madrid, a consul general in the United States and retained its legation in Copenhagen. Diplomatic representatives of Great Britain, Norway, Sweden, Denmark and the United States resided in Reykjavik.

On May 10 British troops landed in Iceland, and a force of 60,000-80,000 was maintained there in order to prevent German use of the island as a base for action in the Atlantic. The British did not interfere with the government or freedom of speech, and the Icelanders, while none too friendly, tried to believe that the British soldiers would evacuate as soon as the war ends. The occupation created social problems among a people only twice as numerous as the garrison itself, but it also stimulated business. Icelandic ships continued to operate and the country sold its entire output of herring meal and herring oil, and the catch of cod, to Great Britain.

Banking and Finance.—Budget est. (1939): revenue, 17,904,960 krónur; expenditures, 16,705,791; (1940): revenue, 18,594,830 krónur; expenditures, 17,857,448. Public debt (Dec. 31, 1938), 47,161,000 krónur, of which 41,281,000 was foreign indebtedness; state assets est. at 75,466,000 krónur.

BIBLIOGRAPHY.—Hjalmar Lindroth, *Iceland, a Land of Contrasts*. (F. D. S.)

Ice Skating. The country-wide popularity of ice carnivals called many of the best skaters from amateur ranks to make up the personnel in the six huge ice extravaganzas which toured the United States. There was a steady growth in the number of skating clubs in all parts of the country, and although skaters in the east used to win all of the titles, 1940 saw California youngsters pluck two big title plums.

The graceful art of figure skating welcomed a new national champion in 1940, Eugene Turner, of Los Angeles. Another coast skater, Miss Ramona Allen, of Oakdale, won the women's national junior title. For two years in succession, Miss Joan Tozzer won the women's national title and paired with Bernard Fox (both of Boston) won the national pairs championship. The national fours title went to the St. Paul Figure Skating club, and the national dance title to Miss Dorothy Glazier and Stephen Tanner, Boston skaters. Miss Maxie Herber and Ernst Baier, the 1936 Olympic figure skating pair, were for the fourth time the champion pair of Germany.

The country's leading speed skater in 1940 was the Olympic champion, Leo Freisinger, of Chicago, who captured both the national and North American championships, winning the races at 220, 440 and 880 yards, and one mile. Miss Madeleine Horn, of Beaver Dam, Wis., won the women's events in both of these skating classics, taking the 440 and 880 yards, and three-quarter-mile events. The Middle Atlantic championships were won by John A. Roukema and Miss Virginia Jahn. The Eastern States titles were won by Ted Ellenwood and Miss Alice Burnham, and indoors by Joe Bree and Miss Marjorie Cummings. (J. B. P.)

Idaho is one of the far northwestern states, belonging to the group regionally designated as the Pacific northwest. It has an area of 83,888 sq.mi. Its peculiar shape has often been commented upon; it has the longest boundary line in proportion to either area or population of any of the states and, with the possible exception of Pennsylvania, is the only state in the union touched by six other states and a foreign country. This fact affects almost every phase of governmental cost.

Population according to the United States census of 1940 is 524,873. Boise is the capital and largest city. (See CENSUS, 1940.)

Of the state's population 36.4% is urban. In 1930 there were 437,562 whites, of whom 407,108 were native born; there were 3,638 Indians. In literacy the state was third in national rank and fourth in the preponderance of native born. Figures for 1940 were not available (Jan. 1, 1941) but percentages would be probably not materially changed.

History.—In the presidential election, Nov. 5, 1940, Roosevelt received 127,842 votes and Willkie, 106,553. For the state, there were elected a Democratic governor and a Democratic legislature, while John Thomas, a Republican, was sent to the United States senate. Henry Dworshak, a Republican and Compton I. White, Democrat, represent the two congressional districts. Senator D. Worth Clark, Democrat, was elected in 1938.

Senator Thomas succeeded William E. Borah, whose death occurred in Jan. 1940; Thomas's term will expire in 1942. State officials for 1941-42 were: Chase A. Clark, governor; Charles C. Gossett, lieutenant governor; George H. Curtis, secretary of state; Bert H. Miller, attorney general; Calvin E. Wright, state auditor; C. E. Roberts, superintendent of schools; Arthur Campbell, mining inspector.

The 26th legislature convened on Jan. 6, 1941. Both houses were Democratic, and apparently in sympathy with Governor Clark's program. The budget, placed before the body, called for materially larger expenditures than during the preceding biennium. Among the important measures pending were those looking to the abolishing of a number of commissions in favour of one-man control. A retail sales tax measure was scheduled to be placed before the legislature in 1941 as an additional source of revenue.

Education.—School population in 1940 was 120,987. There were 86,829 pupils and 3,107 teachers in 1,012 elementary schools. High school enrolment showed unusual gain, there being 34,158 pupils with 1,405 teachers in 183 accredited schools. The state university is at Moscow, with a southern branch at Pocatello.

Normal schools are located at Lewiston and Albion with a newly built junior college at Boise.

Banking and Finance.—On June 30, 1940 there were 18 national and 32 state banks with a capital of \$9,506,497, deposits \$100,426,727, and total resources \$112,991,928. State treasurer's receipts from Sept. 30, 1939 to Dec. 31, 1940 were \$59,603,829; balance at close, \$5,972,979. The state's assessed valuation was \$387,495,500. The state entered 1941 in sound financial condition.

Agriculture, Manufactures, Mineral Production.—Most re-

CHASE A. CLARK, Democrat, elected governor of Idaho Nov. 5, 1940

cent statistics (1935) reveal 45,113 farms, valued at \$307,395,329. Leading crops for 1940 were as follows: wheat, 24,381,000 bu. valued at \$11,898,000; hay, 2,373,000 tons, valued at \$15,070,000; potatoes 32,860,000 bu., valued at \$9,858,000.

There were 533 manufacturing establishments with 12,797 workers and a total pay roll of \$10,249,586. In 1940 Idaho's "big five" metals produced as follows: gold 145,000 oz., valued at \$5,075,000; silver, 1,235,000 oz. (\$12,250,000); lead, 207,600,000 lb. (\$10,380,000); zinc, 141,300,000 lb. (\$9,184,500); copper, 6,700,000 lb. (\$757,100).

Since the first discovery of gold in 1860, Idaho has produced \$170,000,000 of that metal with a total metal output of nearly \$1,500,000,000. (B. DE.)

Illinois, a north central state of the United States, admitted to the union in 1818, by 1940 census reports has a population of 7,897,241, a 3.5% gain over 1930. Springfield, the capital (75,503), ranks fifth in population after Chicago (3,397,808), Peoria, Rockford and East St. Louis. Greatest gains were made in the oil fields by Marion county (34.7%) and Central (29.9%).

More than half of the population is urban.

History.—The death of Governor Henry Horner on Oct. 1, 1940, after a two-years' illness, brought to the governorship Lieutenant Governor John Stelle, a keen critic of the Horner administration who had himself lost the nomination for the office in April. His three months in office saw numerous replacements of appointive officers, among whom were five directors of administrative departments.

The heaviest Illinois vote on record (4,262,196 ballots) gave in 1940 a majority to Roosevelt for the presidency (Roosevelt 2,149,943; Willkie 2,047,240), but elected from the Republican column a U.S. senator, Wayland C. Brooks, to finish the term of the late J. Hamilton Lewis; other Republicans elected were 16 out of 27 congressmen; all state officers with one exception and a majority in both houses of the general assembly. In 1940 by federal reapportionment based on the 1940 census, Illinois will lose one seat in congress.

New state officers (inaugurated Jan. 13, 1941) were Dwight H. Green, governor; Hugh W. Cross, lieutenant governor; Edward J. Hughes (D.), secretary of state; A. C. Lueder, auditor; Warren Wright, treasurer; George F. Barrett, attorney general.

The general assembly convened in special session on April 3, 1940, its chief accomplishment being to increase old-age pensions to a maximum of \$40 a month.

Education.—Public instruction in Illinois is supervised by the state superintendent of public instruction, elected for four years in the off-year election. For the year ending June 30, 1939, the enrolment (elementary and secondary schools) was 1,272,333 with a teaching staff of 48,919. School buildings numbered 14,188. Schools are supported by local taxation and a state distributive fund and are administered by some 12,000 school boards. Of the state's higher institutions of learning, the University

Illinois in the fall of 1940 had a registration of 14,134, of whom 93 were in Chicago departments. The five state teachers' colleges reported a total registration of 7,351.

Public Welfare.—The estimated number of persons dependent on five public assistance programs in Illinois in Sept. 1940 was 952,015, or 12.1% of the population. General relief served 78,466; WPA employment, 357,466; old age assistance, 139,926; others' pensions, 16,296; blind pensions, 7,627. Maximum old-age pensions were increased in 1940 to \$40 a month, but the average payment in September was \$21.49. In September persons on general relief were paid \$5,107,495.56. In the first ten months of 1940, Illinois unemployed were reduced by 135,000, although slightly more than 100,000 were removed from relief lists. Unemployment insurance benefits July 1, 1939–March 30, 1940, first paid, amounted to \$27,522,012 to 276,615 workers.

The director of the state department of public welfare, A. L. Owen, in July 1940 was convicted of gross omission of duty in connection with the typhoid epidemic at Manteno State hospital in 1939. After Bowen's resignation Governor Stelle appointed Charles E. Day director of the department.

National Defence.—Chanute field at Rantoul with its air corps technical school was in 1940 midway in a four-year permanent construction program on which \$13,000,000 had already been spent. For the emergency, temporary construction will supplement quarters to take care of the 16,000 men per year who will be trained as radio technicians and skilled mechanics. Scott Field at East St. Louis, a branch of the school, was also being expanded and annexed Jefferson barracks across the river as a training station and ground training school for communications. The war department too has an expansion program for the Rock Island arsenal (one of the largest), and let contracts for construction of a replacement centre at Camp Grant, Rockford.

The 33d division, Illinois national guard, ordered out for active service, was to go into training in February at Camp Peay, near Tullahoma, Tenn. With a strength of approximately 13,000 men to be supplemented by 23,000 inducted under the selective service law. Three units of the division were in service in 1940: the 202nd coast artillery corps, Co. B, 192nd tank battalion, and the 106th cavalry; in addition 350 naval reservists were undergoing in Chicago preparatory to being sent to sea in January.

Paul G. Armstrong was in 1940 directing selective service in Illinois through 284 local draft boards. More than 100,000 men registered in the state on Oct. 16, 1940. On Nov. 18 the first quota of 828 men was inducted. Fort Sheridan, Camp Custer, and Camp Jackson, are the 6th corps reception centres.

The Illinois reserve militia, ages 18 to 45, with duties similar to those of the national guard, was being organized by proclamation of the governor.

Finance.—For the first 10 months of 1940 the state's revenue receipts were as follows: direct property tax arrears, no tax levied since 1932), \$155,906.94; inheritances, \$600,523.24; liquor taxes, \$9,612,013.49; insurance fees and

taxes, \$7,443,298.19; corporation fees and taxes, \$3,409,542.38; interest on state funds, \$88,956.28; sales tax, \$79,658,677.22; public utility tax, \$8,332,753.00; motor fuel tax, \$37,276,736.07; motor vehicles tax, \$19,653,809.00; Illinois Central railroad, \$982,000.83; miscellaneous, \$7,930,872.53.

Industry.—A survey in Dec. 1940 of the Chicago area (four Illinois counties and Lake county, Indiana) showed industrial employment at the highest level in 11 years, with 9,000 plants employing 540,000 workers. October figures of the Illinois department of labor gave 6,647 industries with 674,484 workers, showing for the sixth consecutive month a better than average increase over a seventeen-year period.

National defence needs had Illinois manufacturing industries in 1940 filling army and navy contracts for steel, diesel engines, caterpillar tractors, telephone equipment, small arms, munitions and other items, including 9,000,000 lb. of canned meat to be supplied by Feb. 1. At Wilmington an \$11,000,000 munitions plant and a \$14,000,000 loading plant will be built and operated for the government on a cost-plus-fixed-fee basis. Some contracts provided for the expansion of privately-owned plants.

With Illinois leading in soybean production, Decatur has become the centre for processing soybeans and manufacturing by-products and is expanding its plants; others are operated at Gibson City and Quincy. Illinois had an estimated crop of 37,230,000 bu. of soybeans, 17 bu. an acre, both crop and yield being less than the 1939 figure. Rains came too late to repair all damage done to the 1940 corn crop, which is estimated at 321,941,000 bu., 43 bu. to the acre, a decline from 1939 in both yield per acre and total. Apples will yield about 1,876,000 bu., about 31% of a full crop. Coal production in Sept. 1940 was heavier than a year ago by 182,308 tons. Oil production increased until mid-summer, when some weeks showed a decreased output. Up to Nov. 15, 1940, nevertheless, 131,530,000 bbl. had been produced as against a total 1939 yield of 94,307,000 bbl. (T. C. Pe.)

Illinois, University of. In the academic year 1939–40, the university had 17,212 persons enrolled in its classes, not including correspondence courses. The 1940 summer session set a new high mark with 4,069 students. In Nov. 1940, enrolment for the first semester of 1940–41 was 14,134. Of these, 12,358 were on the campus at Urbana-Champaign, 1,193 on the campus at Chicago, and 583 in extramural courses being taught in 12 other Illinois cities. Of the enrolment, 1,462 were graduate students, these numbering 1,292 in the graduate school at Urbana-Champaign, and 170 in graduate work in the Colleges of medicine and dentistry in Chicago. Completed during the year were a natural resources building and additions to the library and hospital. At Chicago, an addition to the medical and dental laboratories building was occupied, and work was started to remodel the old college of pharmacy quarters into a student union.

The library is fifth in size among all American universities, and largest of any state university. Total number of items in it in 1940 was 1,583,000. This included 1,158,000 books, 341,000 pamphlets, 3,900 maps and 11,300 pieces of sheet music in the main library and 17 departmental libraries at Urbana-Champaign; and 60,000 books and 10,000 pamphlets in the departments at Chicago.

The 1940–41 university staff for instruction, research, extension, library and administration numbered 2,156 active members. For the 1940–41 year the operating budget was \$8,510,806. This included \$5,432,500 from tax revenues.

Illiteracy.

During 1940, because of wars and upheavals over wide areas of the globe, there was a net loss in the

DWIGHT H. GREEN, Republican, elected governor of Illinois Nov. 5, 1940

world's efforts to reduce illiteracy and in similar movements toward popular education. Germany, which before the World War (1914-18) had established a high record in all forms of education, has lost ground during recent years because of concentration on military enterprises which culminated in 1939 in the European war. In Czechoslovakia, Poland, Holland, Belgium, Norway and France there have been such national disturbances because of invasion that education has suffered along with all other public services. China, with the greatest number of illiterates of any nation in the world, has been compelled because of the Japanese invasion to abandon her recent effective efforts to teach the masses to read through a simplified "alphabet" of 1,000 characters. Reports from the Union of Soviet Socialist Republics, where mass education had reduced illiteracy from the 75% of 1895 to less than 30% in 1937, indicate a slowing down in educational programs. Italy, Spain and all the countries of eastern and southern Europe have been too busy with wars and the threats of war to make any concerted national efforts toward popular education and national literacy. India and Egypt still report illiteracy of over 80% of the population. Mexico and other Latin American nations are making heroic efforts to improve the education of their people, but illiteracy in all these countries is still exceedingly high. In Mexico nearly 60% of the population over ten years of age is still unable to read or write.

The United States of America was one of the few countries to continue to make progress in the reduction of illiteracy during the year 1940. A nation-wide effort to teach the whole nation to read and write continued to be the chief item in the vigorous program in adult education of the Work Projects administration. In 1930—the last year for which comprehensive figures are available—the United States possessed 4,283,753 illiterates over ten years of age, or 4.3% of the population of that age. The best record (only .6% illiterates) was shown by whites of foreign or mixed parentage, native whites having 1.8% illiterates, foreign born whites having 9.9% and Negroes 16.3%. Rates in given states, according to the 1930 census, ranged from Iowa with only 0.8% of its population illiterate to South Carolina with 14.9%. While Negroes still show the highest illiteracy of any large group of the U.S. population, they have made the greatest recent progress. At the time of emancipation in 1863 it was estimated that of the 4,500,000 slaves and "free persons of colour" in the United States less than 5% could read and write; in 1939 the 12,000,000 U.S. Negroes had a literacy rate above 85%. The Work Projects administration reported in 1939 that during six years of intensive effort it had taught 1,300,000 people to read and write. The 1940 census figures will probably show a reduction in illiteracy to about 3% of the population over ten years of age, by far the best record the nation has shown at any time in its history. (E. R. E.)

Immigration. Governing Law.—Immigration into the United States is limited both qualitatively and quantitatively. The act of Feb. 5, 1917 provides for the exclusion and deportation from the United States of aliens who do not satisfy certain mental, physical, moral and economic requirements.

The act of May 26, 1924, known as the quota act, permits only a limited number of immigrants of each of certain nationalities to be admitted to the United States each year for permanent residence. These restrictions do not apply (1) to persons born in Canada, Newfoundland, the Panama Canal Zone, or independent countries of the western hemisphere; (2) to the wives and unmarried minor children of citizens of the United States, nor to husbands of citizens by marriage before July 1, 1932; nor (3)

to school professors or ministers of religious denominations in their families. The Alien Registration act, 1940, requires that record be made and kept current of aliens in the United States. All aliens (except foreign government officials and their families) who remain in the United States 30 days or longer must be registered and, if 14 years of age or over, fingerprinted. The number of aliens thus shown to be in the United States and its territories in 1940 was approximately 4,900,000.

Flow of Immigration.—During the fiscal year ended June 30, 1940, 208,788 aliens entered the United States and 166,164 departed, exclusive of commuters and short-time visitors crossing the international boundaries. Of these, 70,756 left their homes in foreign countries and entered the United States for permanent residence, and 21,461 departed for permanent residence elsewhere. Of those entering for permanent residence, 50,700 were from European countries, 17,822 from the Americas and 2,480 from Asiatic and other sources; 5,474 came in non-quota as the spouses or minor children of United States citizens.

Activities of Immigration Officers.—The administration of the law relating to immigration is under the direction of the Special Assistant to the Attorney General in Charge of the Immigration and Naturalization service, Washington, D.C.

Officers of this service passed upon 51,831,025 citizen and alien entries into the United States during the fiscal year, of which 50,102,398 passed across the Canadian and Mexican borders. Immigration officers boarded 33,176 vessels and inspected 1,178,617 seamen. Officers of the Immigration Border patrol patrolled 7,895,348 mi. and questioned 987,274 persons. Because of unsettled international conditions the Border patrol was being strengthened still further.

During the period 6,954 aliens were deported from the United States, 8,594 aliens who were considered deportable were allowed to depart at their own expense, making a total of required departures of 15,548. (See CENSUS, 1940; REFUGEES.) (L. B. S.)

Imports: see INTERNATIONAL TRADE; TRADE AGREEMENTS.

Income Tax. Extensive modifications were made in the general income tax laws during 1940. The rates for both individuals and corporations were increased, personal exemptions were lowered and a corporation excess profits tax was enacted. Federal income tax collections in the fiscal year ended June 30, 1940 amounted to \$2,121,073,000, or 37.3% of the total federal internal revenue and customs. The individual income tax produced \$982,017,000 and the corporation income and excess profits tax, \$1,139,056,000.

State income tax collections for 1940 are estimated to have been \$345,916,000, or 8.5% of estimated state tax revenues.

Individual Income Tax.—The federal government's individual income tax consists of a 4% normal tax and a surtax ranging from 4% to 75%, applicable to incomes over \$4,000 after allowance for exemptions and credits. The Revenue act of 1940, which is applicable to taxable years beginning after Dec. 31, 1939,

sed surtax rates on surtax net incomes in all of the brackets a \$6,000 to \$100,000. The rates on surtax net income in excess of \$100,000 were not changed. A temporary increase in the normal tax for purposes of national defence was also imposed for taxable years beginning after Dec. 31, 1939 and before Jan. 1, 1945. This defence income tax is equal to 10% of the total normal tax and surtax, with the provision that such increase shall be greater than 10% of the net income remaining after income tax as determined without regard to the defence tax.

The Revenue act of 1940 also made significant changes with respect to personal exemptions. Personal exemptions were lowered from \$2,500 to \$2,000 in the case of married persons and heads of families and from \$1,000 to \$800 in the case of single persons. The credit for dependents and the earned income credit remained unchanged. A credit of \$400 is allowed for each dependent. The earned income credit, applicable against the normal tax, is at a rate of 10%, allowable only on amounts of earned income in excess of \$14,000, with \$3,000 of income considered earned whether or not actually earned. These provisions serve to exempt from federal income taxes single individuals with net incomes of \$2,000 or less and married persons with net incomes of \$2,222 or less if without dependents.

Requirements as to filing federal income tax returns were also changed by the Revenue act of 1940. Under the prior law, no return was required if net income was below the personal exemptions and gross income was less than \$5,000. Under the 1940 act a return is required from a single person if his gross income is \$5,000 or more, and from married persons if either their separate or aggregate gross income is \$2,000 or more.

Federal income tax data for 1938, compiled from income tax returns filed in 1939, show that in that year there were 3,048,545 taxable individual and fiduciary returns of which 2,995,664 were individual returns. These data reveal further that 64% of the total net income reported by individuals was received by persons having less than \$5,000 and 94.3% by persons having less than \$10,000 net income each. On the other hand, due to the operation of the exemptions and the progressive surtax rates, 8.3% of the total individual income tax liabilities was reported by persons having less than \$5,000 net income and 51% by persons with less than \$50,000 net income.

Individual income was in 1940 taxed in 31 states and the District of Columbia. In all but three of these the rates were progressive, the minimum rates ranging from 1% to 3%, and the maximum rates from 3% to 15%. Four additional states taxed certain sources of income at flat rates. Six states in the above groups imposed surtaxes, two of which apply only to income from intangibles and one to income from speculative transactions. With one exception, surtaxes were imposed at flat rates. In no instance, however, did the maximum state income tax rate, including both normal and surtax, exceed 15%. As a result of the lowering of personal exemptions under the federal income tax, the personal exemptions allowed by states were in 1940 either at the same or a higher level in 25 states for single persons, in 21 states for married persons and in 13 states for dependents.

Although some states preceded the federal government in imposing the income tax, more than half of the states imposing it adopted it in 1929 or thereafter. Since 1937 no additions have been made to the list of states which tax income. There were enacted in 1939 the District of Columbia income tax, which applies to both individuals and corporations, and Philadelphia's tax on earned income of individuals and unincorporated businesses. These taxes represent the only income taxes imposed in 1940 by local governments in the United States. Philadelphia's tax imposes a rate of 1½% on wages, salaries and other compensation, and on net profits of unincorporated businesses, professions or

other activities. No personal exemptions or credits are allowed. Deductions may be made for direct expenses incurred in deriving the income. In the case of residents, the tax applies regardless of the source of the taxable income, while in the case of non-residents, it applies only to income derived within the city.

Revisions in state individual income taxes during 1940 included rate increases in Louisiana and Mississippi, extension of the emergency 1% tax in New York through 1941 and repeal of the surtax on interest and dividends in South Carolina. A special feature introduced by the 1940 Louisiana law was an additional tax of 5% on net income in excess of \$5,000 derived from certain speculative transactions (sales of unimproved lands, leases of mineral lands, sales of mineral rights, etc.).

Corporation Income Tax.—The federal corporation income tax rates applicable to taxable years beginning after Dec. 31, 1939 were revised by both the Revenue act of 1940 and the Second Revenue act of 1940.

Under the federal tax, a flat rate is applied to corporations with normal-tax net incomes of more than \$25,000. Corporations with normal-tax net incomes of \$25,000 or less are taxed at lower graduated rates. In the case of corporations with net incomes of slightly over \$25,000, the law provides for an alternative tax which is designed to accomplish a gradual transition between the tax on corporations with net incomes of \$25,000 and less and the tax on those with net incomes in excess of that amount.

The Revenue act of 1940 increased the corporation income tax rates by 1%. In addition, a defence income tax equal to 10% of the corporation income tax, as determined without regard to the defence tax, was imposed for taxable years beginning after Dec. 31, 1939 and before Jan. 1, 1945. Under the Second Revenue act of 1940, the income tax rate on corporations with normal-tax net incomes in excess of \$25,000 was increased by 3.1%. For taxable years beginning after Dec. 31, 1939, the total tax rate, including the defence tax is, therefore, 24% for corporations with normal-tax net incomes in excess of \$25,000. For corporations with normal-tax net incomes of \$25,000 or less, the graduated rates range from 14.85% to 18.7%.

The Second Revenue act of 1940 imposed an excess profits tax on corporations, liberalized amortization of emergency facilities for defence purposes and suspended the profit-limiting provisions of the Vinson-Trammel act and certain provisions of the Merchant Marine act of 1936.

The Excess Profits Tax act of 1940 applies rates ranging from 25% to 50% to that portion of the excess profits net income of a corporation which exceeds the excess profits credit plus a specific exemption of \$5,000. Excess profits net income consists of net income subject to the income tax with certain adjustments, some of which are the exclusion of long-term capital gains and losses, and the deduction of the amount of the income tax and dividends received. The excess profits credit is equal to 8% of invested capital (equity invested capital plus 50% of borrowed capital) or 95% of excess profits net income for the base period 1936-39, whichever the taxpayer may elect. Provision is made for the exemption of all corporations exempt from the income tax as well as certain other types of corporations. The act contains special relief provisions which are intended to take care of abnormalities in income in the taxable period. Classes of income which may be considered abnormal are specified. In addition, a general relief provision grants to the commissioner of internal revenue authority to make such other adjustments as may be necessary to adjust abnormalities affecting income or capital.

Special amortization allowances have been made under the Second Revenue act of 1940 for emergency facilities necessary for national defence. Upon certification of the advisory commission to the council for national defence and either the secretary of war

or the secretary of the navy, the amortization of certain facilities may be spread over a period of 60 months (or less if the emergency period ends in less than 60 months). This deduction is to be in lieu of the regular allowance provided for exhaustion, wear and tear, and obsolescence in the internal revenue code.

General corporation income taxes are also levied by 32 states and the District of Columbia. One additional state restricts its corporate tax to income from intangibles. Six states impose graduated rates, the minimum rates ranging from 1% to 3% and the maximum rates from 5% to 8%. The other 27 states and the District of Columbia impose flat rates, ranging from 1½% to 8%. Rates of 2%, 4% or 6% are most frequent. During 1940 rate increases were made in Louisiana and Mississippi.

Preliminary federal income tax statistics for 1938 show that 520,500 corporations filed income tax returns for that year, of which 169,885 reported net incomes and 301,146 reported deficits. The remaining 49,469 corporations were inactive during the year. The aggregate net income of the corporations reporting net incomes was \$6,525,988,940; the total deficit of the corporations with no net income was \$2,853,093,270.

The classification of corporations by the size of their net incomes for 1938 was not available in 1940. In 1937, only 13.3% of the total net income corporations reported net incomes in excess of \$25,000. The corporations in this group, however, accounted for approximately 93% of the total net income and paid approximately the same percentage of the total tax. (See also LEGISLATION: *Federal*; TAXATION.) (R. BL.)

British Empire.—Owing to the war the income tax position in the United Kingdom was again for the year 1940–41 affected by the introduction of a second budget.

Under the Finance act, 1940, the income tax rate was raised to 7s.6d. in the £. No change was made in the surtax rate on incomes over £2,000, which ranged from 1s.3d. in the £ to 9s.6d. in the £ on any excess over £30,000. Reductions in certain allowances, such as the personal and child allowances, and the earned income, reduced rate and age reliefs, came into force under the terms of an earlier finance act.

The Finance (No. 2) act, 1940, raised the income tax rate for the whole of the year 1940–41 to 8s.6d. in the £. The surtax on incomes over £2,000 was raised to rates ranging from 2s. in the £ to 9s.6d. in the £ on any excess over £20,000. Further adjustments were made in certain of the allowances to individuals, and a scheme was introduced under which income tax was in future to be deducted at the source from wages and salaries.

The exigencies of the war situation led to a vigorous discussion in the press of various new fiscal proposals. J. M. Keynes pointed out that a reduction in the production of goods for civilian consumption, coupled with a rise in money incomes, especially amongst certain classes of wage-earners, would necessarily lead to inflation unless some method were found of withdrawing the surplus purchasing power from the market. As an alternative to exceptionally heavy taxation he propounded a scheme for compulsory savings on a graduated scale according to the individual's income and family responsibilities, repayment to be made by instalments after peace had been declared, when the additional purchasing power so released would serve a valuable function in tiding the industrial machine over the transitional period when economic disturbance would otherwise be at a maximum. The scheme had a mixed reception, but led to a wider recognition of the necessity for reducing civilian consumption in order to maximize war production. Subsequent unofficial proposals included a tax on excess war income—to correspond to the excess profits tax on businesses—and a substantial reduction in the lower limits of the ordinary income tax. Much ingenuity was expended on these and other schemes, but only time could

show to what extent they would commend themselves to the chancellor of the exchequer, who was in the best position to judge their relative merits.

The increases in the rates of United Kingdom income tax have been paralleled by a similar movement in Eire, the dominions and colonies. The outbreak of the war resulted in an almost general increase in tax rates and reduction in the reliefs granted to individuals, and a number of colonies introduced an income tax for the first time. As the war continued the early increases in tax rates proved to be inadequate, and a second wave of increases had by the end of 1940 in most cases brought the rates to substantially higher levels than were in operation in the pre-war period. (H. E. A. C.)

India, a sub-continent projecting from the mainland of Asia, lies between the 8th and the 37th degrees of North latitude. It comprises 11 major or "autonomous" provinces and five minor areas directly administered by the central British government, and a large number (between 500 and 600) of states under Indian rulers. The latter are scattered about the continent and vary greatly in size and importance, as well as in the powers enjoyed by their chiefs. British India (the 16 major provinces and minor areas) has its capital at Delhi and is under a viceroy and governor-general (the Marquess of Linlithgow since April 1936), who is also the representative of the crown in its relations with the states. The total area is 1,575,107 sq. mi., of which the native states and agencies total 712,508 sq. mi.; population (est. 1938) 362,828,000. Chief towns (pop. census 1931): Calcutta (1,485,582); Bombay (1,161,382); Madras (647,230); Hyderabad (466,894); Delhi (447,442); Lahore (429,750). Ruler, George VI, emperor; languages, Hindi, Bengali and Urdu the most important; religions, Hinduism (approx. two-thirds), Mohammedan (approx. one-fifth).

History.—So far as it was not, for the great mass of its people, exclusively engrossed in daily toil, India during 1940 was marked by political campaigning and the European war. Between the two an unhappy relation had been established by the refusal of the national congress to participate in any war effort, and indeed by its threat to institute passive resistance, under which the British government gave a guarantee of India's immediate independence. To this demand the viceroy (Lord Linlithgow) speaking at Bombay early in January, gave a reasoned and conciliatory reply. The British government's objective for India, he explained, continued to be full dominion status of the state of Westminster variety; the government would be ready to consider a revision of the existing constitution, as soon as practicable after the war, with the aid of Indian opinion; the government was prepared at once to bring representative political leaders into the governor-general's cabinet; and it would give every help in overcoming communal difficulties in the way of Indian unity. He appealed to the leaders of the great political parties to get together and co-operate in ending the deadlock. Two days later the president of the congress issued a statement that his party would accept nothing less than complete independence for India; his working committee following with the denial that Indian freedom could exist "within the orbit of British imperialism." Mohandas Gandhi, who had at first seen in the viceroy's speech "the germ of a settlement honourable to both sides," soon began to vacillate. Although he expressed his detestation of Hitlerism and declined to be hustled into a mass movement of passive resistance, still he saw no prospect of peace until "India is as free a country as Britain." Ultimately he endorsed the more extreme pronouncements of the congress, committing himself to the assertion that the vast majority of his people "make no distinction between Naziism and the double autocracy

FIRST DETACHMENT of Indian troops arrived in France early in 1940 in the ill-fated British expeditionary force there

rules India." Disclaiming any desire to embarrass Britain, contributed the following sentiment to its cause: "Let Hitler and Mussolini take possession of your beautiful island, your people and allow yourselves to be slaughtered, but refuse to show allegiance to them."

Meanwhile the other dominant interests in India had not been idle. The Moslem league, through its president, M. A. Jinnah, stated that in any revision of the constitution there should be adequate safeguards for co-religionists, and categorically rejected the demands of the congress as meaning nothing but British rule. The princes in conclave declared that they would be glad to see India become a dominion under the British crown, but only if accompanied by guarantees for the sovereignty of their states and the protection of their treaty rights.

In August the viceroy and L. S. Amery, who had become secretary of state for India in the British government, made a concerted effort for a settlement. The governor-general's cabinet would at once be enlarged by the inclusion of representative Indian leaders with definite portfolios, and a War Advisory Council would be set up; while at the end of the war a representative body would be entrusted with the devising of a new constitution. The British government, however, was not prepared to transfer responsibility "to any system of government whose authority was directly denied by large and powerful elements in India's political life." The congress lost no time in totally rejecting the proposals; The Moslem league welcomed them, but renewed its earlier idea of partitioning India and creating independent Mohammedan states in the northwest and eastern zones where it counts most of its followers. The position at the close of 1940 stood that congress, at Mr. Gandhi's insistence, issued a manifesto on Sept. 15 withdrawing any conditional offer of co-operation with Great Britain in the war, but promising to restrict its resistance to the minimum required "for preserving the people's liberties," whatever this might mean. A fortnight later a comment of the Moslem prime minister of the Punjab upon the demand was: "Mr. Gandhi's demand amounts to this, that while Britain is engaged in a life and death struggle against Hitlerism she should be given freedom to stab her in the back."

The impasse thus continued. It had apparently done the congress no good, as the number of enrolled members of that body is said to have fallen from 4,500,000 in 1938-39 to under 2,000,000 in 1939-40. On the other hand, the Moslem league had improved its position. It had less of the schism and indiscipline

which Mr. Gandhi laments in the congress; and it had gathered strength from the attempts of the congress to seduce its followers, as well as by raising the old cry of Islam in danger. The princes also were arriving at greater unity among themselves, and the prospects of a constituent assembly threshing out an agreed constitution for the country were far from rosy.

India's War Effort.—Hampered though it was by the intransigence of the congress, the war effort of India was steadily gaining momentum. Public opinion in the country, when it had not been decked out for public purposes, was unanimous against Hitlerism. "Where," to quote the Punjab premier again, "will India stand? On the one side are the forces of irreligious tyranny and oppression, on the other are justice and freedom. There is no room for vacillation or doubt." Men, materials and money were steadily pouring in to the support of the British cause. The princes, faithful to their traditions, had taken the lead, practically offering their all. That trusting neighbour, the Maharajah of Nepal, sent 8,000 of his own troops to help in garrisoning India while its forces were required elsewhere. The Indian army, including 16 units from Indian states, had already been serving from Malaya to France, and 100,000 men were added to it, the training of Indian officers being correspondingly expanded. The air force was quadrupled, and a volunteer reserve, created mainly for coast defence, was overwhelmed with entrants. The royal Indian navy grew out of all recognition. In addition to the old escort vessels it included in 1940 a large fleet of anti-submarine craft, minesweepers and patrol boats; and the personnel was two and a half times as strong as it was before the war. It rendered valuable help to the royal navy in securing the safety of the Red sea route to the middle east, and no less than 71 troop and military supply ships proceeded from Indian ports to their destinations during the first 12 months of the European war, without a single casualty.

Gifts of money ranged from the princely donations of the states to innumerable offerings from all classes, and for all purposes, from the purchase of Spitfires to the relief of air-raid sufferers. But it was chiefly in material supplies that India's power would be felt. Its geographical position and its great reserves of raw materials and labour enable it to supply the necessities of war throughout the Red sea littorals, the Mediterranean, the Indian ocean and elsewhere, thus setting free, for use in other directions, Britain's resources, especially shipping. At the end of 1940 India was in a position to supply 90% of its own war requirements—rifles, machine guns, and artillery up to 6-inch guns and howitzers, as well as saddlery, clothing, etc. In July it was disclosed that the ordnance factories were working 22 hours a day. Besides this measure of self-sufficiency, India exported large quantities of metal and leather products, textiles, machine tools, foodstuffs and oilseeds. Some typical cases will serve as examples: army boots came to the United Kingdom at the rate of 125,000 pairs a month; pig and foundry iron at the rate of 50,000 tons a month; and—most spectacular of all—orders were completed for 1,000,000,000 sandbags, enough if laid end on end to reach to the moon and back. The productive power which this effort called into existence will have a profound influence on India's future as an industrial nation when peace is restored. Meanwhile, to ensure its efficiency, a conscription ordinance required the recruitment of about 1,000 European British subjects to be available for special technical duties in connection with war supplies. A suggestive comment on the growing importance of industrial India was the meeting of the Eastern Group conference at Delhi in October. The conference was attended by representatives of the British dominions from Ceylon down to Australia on the one side and South Africa on the other. It dealt exclusively with war supply problems, and its object was the settle-

ment of a joint war supply policy for the eastern group of the commonwealth in which the maximum use could be made of each existing and potential capacity of the participants for the supply of force and materials in the eastern Mediterranean and all areas east of Suez.

Domestic.—Behind the façade of politics and war effort the ordinary life of the country was uneventful. The provinces in which the cabinets had, at the instance of the congress, refused to function were administered without trouble by the governors and their official advisers. Communal strife abated and endeavours to foment labour troubles were less successful. For these results the improvement in trade, reflected in an unexpected improvement in the railway and postal revenues, and a substantial rise in agricultural prices were in a considerable measure responsible. The government also took action against some of the communist leaders, including S. C. Bose, who was president of the congress in 1939 and founder of the extreme forward bloc.

In Ajmer-Merwara there had been a failure of crops which necessitated certain famine relief measures during the year.

In Bengal the future of the permanent settlement was becoming a critical issue. It is an arrangement, now 150 years old, by which the landlords pay a fixed revenue to the government, whatever may be their takings in rent, in contradistinction to the rule in other provinces where the government of India obtains by periodical revisions a moderate share—rarely over half—of the rental yield. This yield in Bengal today (1940) is estimated at £9,750,000, and the new provincial government, pressed for funds, would gladly recover more than the £4,000,000, which under the permanent settlement is all that they recover from the landlords. A commission, over which Sir Francis Floud was sent from England to preside, reported on the problem: the majority advise the buying out of the landlords and placing the tenants in direct relations with the government. The scale of compensation will be a matter of much controversy and difficulty.

(ME.)

Education.—Recognized institutions in British India (excluding Burma): primary (males): schools 160,545, scholars 7,755,656; (females): schools 31,699, scholars 2,468,632; secondary (males): schools 11,731, scholars 2,005,031; (females): schools 1,325, scholars 282,841. Colleges (males): number 306, scholars 110,022; (females): number 40, scholars 6,593. Universities: British India 15, native states 3.

Banking and Finance.—Revenue, central government (est. 1939-40) rupees 1,21,79,96,000; expenditure, central government (est. 1939-40) Rs. 1,21,76,79,000; public debt (Mar. 31, 1939): domestic Rs. 7,36,42,00,000; public debt (Mar. 31, 1939): external Rs. 4,69,14,00,000; notes in circulation (Feb. 23, 1940) Rs. 2,24,93,68,000; gold and sterling reserve (Feb. 23, 1940) Rs. 1,57,91,57,000; currency: 1 rupee (rs. 1)=1s.6d. at par; average exchange rate (1938) Rs. 1=17.94 pence.

The heavy drain which the war will impose on the Indian revenues is abated by two fortunate circumstances. In the previous year there had been a distinct return of prosperity, which among other things left a budget surplus in 1939-40, and an arrangement had been reached with the British treasury which accepted for Great Britain a much more generous share of India's military expenditure, especially for duties outside India, than was previously the practice. Consequently the budget for 1940-41 was balanced by only two small increases in taxation: the excise on sugar being raised from Rs.2 to Rs.3 a cwt., and the duty on motor spirit from 10 annas to 12 annas a gallon.

An excess profits tax was to be in operation by the end of the fiscal year and would materially assist future revenues. In June

a defence savings scheme started, which offered: (1) ten-year defence certificates with a tax-free yield of 3½% on maturity; (2) six-year 3% defence bonds, with a redemption bonus of 1%; and (3) a three-year interest-free loan for subscribers to overcome religious objections to taking profit from war loans.

The credit of India remained high and its exchange stable. The government was successfully repatriating its sterling debt, owing to the rise in the world price of the white metal it was able to sell about 65,000,000 ounces of its surplus silver stock to the bullion market without depreciating the value of the silver hoards which represent the savings of the rural population.

Trade and Communication.—Overseas trade 1938-39: imports, merchandise Rs.1,52,32,76,888; exports, merchandise Rs.62,79,16,269; re-exports, merchandise Rs.6,42,35,626; gold and silver coin and bullion, imports Rs.2,77,77,737; exports Rs.1,09,08,106; imports from Afghanistan Rs.2,48,95,446; exports to Afghanistan Rs.50,70,332.

Indian Imports and Exports 1938-39

	Imports from Rs.	Exports to Rs.
U.K.	46,49,10,194	55,51,13,129
Burma	24,34,90,923	10,03,36,003
Japan	15,41,33,950	14,59,02,043
Germany	12,92,72,979	8,55,48,779
U.S.A.	9,77,82,601	13,87,91,101

Communications and transport: Roads (1937) British India only, 69,000 mi. metalled, 200,000 mi. unsurfaced. Railways (1939) mileage open to traffic, 41,134, of which 29,744 mi. government owned. Shipping, tonnage entered (monthly average 1939) 924,200; tonnage cleared (monthly average 1939) 917,500.

Motor vehicles licensed (March 31, 1938): British India 97,872 cars and taxis; 39,172 commercial vehicles; 9,385 motorcycles, including scooters and auto-wheels. Wireless receiver licences (April 30, 1939) 73,698.

Telephones (March 31, 1939): 79,420 straight-line communications, 601 exchanges.

Indiana. A north central state of the United States, popularly known as the "Hoosier state." Indiana was admitted into the union Dec. 11, 1816; that day of the year is now observed as Indiana day. According to the state *Handbook of Geology* (1922), the land surface is 36,045 sq.mi.; rivers and small lakes cover 280 sq.mi. and the southwest corner of Lake Michigan 230 sq.mi., making a total of 36,555 sq.mi. U.S. Topographical Survey maps in process of compilation and publication will doubtless show some variation from these figures.

The population of the state, according to the final figures of the census of 1940, is 3,427,796. There are 92 counties and 1,016 government townships in the state. Principal cities with their population are Indianapolis, the capital, 386,972; Fort Wayne, 118,410; Evansville, 97,062; Gary, 111,719; South Bend, 101,268; Hammond, 70,184; Terre Haute, 62,693; East Chicago, 54,637; Muncie, 49,720; Anderson, 41,572.

History.—Wendell L. Willkie, native-born Republican presidential candidate, carried Indiana in the November election by a vote of 899,466 to 874,063. Henry F. Schricker, Democrat, however, was elected governor by a vote of 889,620 to 885,657. The Republican party increased its majority in the state house of representatives and won a majority in the senate. It elected, as lieutenant governor, Charles M. Dawson; James M. Tuck, secretary of state; Richart T. James, auditor; James M. Givens, treasurer; Clement T. Malan, superintendent of public instruction. One Republican was elected to the supreme court, and another to the appellate court, but both courts have a Democratic majority. Raymond E. Willis, Rep., was elected to the seat in

ted States senate held Sherman Minton, the nocratic contestant.

National Defence Proj-

—Federal enterprises

he state bulked large.

e program of national

ence resulted in suc-

ssive geometrical ex-

ision of the Allison

ngineering company, a

ision of General Mo-

s in Indianapolis. By

ember orders for the

uid-cooled aeroplane

ines produced there

alled \$234,522,000.

e new International

vester company plant

Indianapolis and the

Diesel Engine company at Columbus

re expanded. The highest number of men employed in the

re in making engines in 1937 was 914; as early as Oct. 1940,

re than 8,200 were so employed. The estimated number of

sons employed in the Allison plant alone at the end of the

r was over 13,000. The next development of the defence

gram, in point of time, and the most spectacular was the

lding of a \$50,000,000 powder plant by the Dupont company

th of the Ohio river near Charlestown in Clark county, en-

sed by a 17-mi. fence. Approximately 13,000 men were

mployed there by December, incidentally creating serious diffi-

culties in housing, transportation and local government.

At Union Center in La Porte county an ordnance plant devoted

ely to shell loading was begun, known as the Kingsbury

inance plant; 13,000 ac. were acquired and approximately

0 persons were to be employed in construction. North of

adison, in Jefferson, Ripley and Jennings counties, a tract 17

long, between 3 and 6 mi. wide, embracing some 60,000 ac.

s designated for an ordnance proving ground, and the pur-

se of the land was begun in December. Forty-eight square

es near Burns City in Martin county, chiefly submarginal

d, much of it already acquired by the government for a federal

est, were allotted to a naval ammunition depot for the Atlantic

et; plans for it will make it the largest in the world. An army

base, also, was put under way at Fort Wayne.

Banking and Finance.—June 30, 1940, there were in the state

and 125 national banks, a total of 507 (a decrease of

e, as compared with 1939) with a total capital of \$110,274,405

a increase of over \$6,000,000). Principal assets and liabilities

re general market bonds held, \$62,631,917 (a decrease);

ns and discount, \$318,695,830; state, county and municipal

ds, \$55,606,478; U.S. government securities, \$258,207,462

(decrease); total cash and balance with banks, \$367,890,749;

ings deposits, \$280,905,503; demand deposits, \$611,466,893,

increases except as indicated, as compared with 1939.

The total revenue receipts of the state of Indiana for the year

ding June 30, 1940 were \$93,540,696.40, including: from gross

ome tax \$23,538,224.85; from gasoline tax \$24,565,328.59

l from property tax \$5,481,645.54. State funds distributed to

al units amounted to \$41,532,597.05, the largest items being

schools and roads. Federal aid to all units in the state and

tributions for unemployment compensation during the fiscal

r 1939-40 amounted to \$33,480,690.72; total property tax,

units, \$100,303,087.36; total revenue receipts exclusive of

te distributions, \$195,990,694.65; grand total revenue receipts,

units, \$245,504,956.29. Total gross disbursements by the

HENRY F. SCHRICKER, Democratic governor of Indiana, elected Nov. 5, 1940

state in the year ending June 30, 1940, were \$160,840,117. Unemployment compensation benefit payments for the year were \$9,289,717.48. Total government payments, all units, were \$205,162,390.63 for 1939-40.

Agriculture and Mineral Production.—Unless otherwise specified, figures are for the year 1939, the latest available, and were (Jan. 1, 1941) not final. Total harvested acreage 46 crops, 9,845,800 (1938—10,263,800); total farm value of 66 crops, \$180,188,000 (1938—\$140,727,000); cash farm income and government payments, \$274,203,000 (1938—\$269,912,000). Corn production, 213,416,000 bu.; wheat production, 28,449,000 bu.; oats production, 25,225,000 bu.; soybeans production, 13,962,000 bu.; rye production, 1,608,000 bu. The 1940 production had not been tabulated by Jan. 1, 1941 but ran below the figures for 1939. Estimated total of cattle on farms Jan. 1, 1941, 1,748,000; estimated number of hogs on farms, 4,180,000—both increases.

Principal mineral resources are bituminous coal (between 15,000,000 and 30,000,000 tons extracted each year by strip and shaft mining) lying chiefly in the west and southwestern part of the state; limestone in Owen, Lawrence and Monroe counties; clay used in paving and building brick; sand and gravel (which are largely responsible for the fine road system of the state); petroleum, in which southwestern Indiana witnessed a boom during 1939 and 1940.

Manufacturing, Transportation.—Manufacturing has far outstripped agriculture in the number of men employed and the production of wealth. Indiana ranked first in the states in making iron and steel from crude ore (Gary and the Calumet region); the largest fruit jar factory of the United States is at Muncie; the largest petroleum refinery at Whiting, the largest automobile tire inner tube factory at Indianapolis. Indianapolis, Fort Wayne, Evansville and South Bend have extensive and varied manufacturing plants, including pharmaceutical products, gasoline engines, automobiles, farm machinery, chains and saws.

Railroad mileage remained substantially the same. Electric interurban mileage was further decreased, the only lines remaining at the end of 1940 were those of the Indiana railroad, Evansville and Ohio Valley, Chicago, South Shore and South Bend. Rural electrification along the former interurban lines was supplemented by some two-score rural electrification projects. Less than 100 mi. of hard road were added to the state highway system in 1940, but transportation by trucks and buses continued to increase. Among the approximately 50 airports operated in the state, the municipal airport at Indianapolis was greatly expanded and supplemented by the federal experimental station and an aeronautical school. (C. B. C.)

Indians, American. On April 24, 1940, representatives of 19 of the 21 American republics met together at Patzcuaro, Mexico, for the First Inter-American Conference on Indian Life. Of the nations with appreciable native populations, Canada alone was unrepresented. For the first time in history consideration was given to the social, political, educational and physical welfare of the 30,000,000 Indian inhabitants of the western hemisphere. In addition to official delegates, native Indian representatives from many of the nations also attended. A conference action which may be of far-reaching significance was the creation (subject to ratification by five governments) of a permanent agency for inter-American co-operation on behalf of Indians.

On Oct. 16, 1940, for the first time since the Indians of the United States were granted full citizenship (1924), the nation called upon them for co-operation in national defence by enrolling under the Selective Service act. Despite generous participation by Indians in the American armed forces during the

war of 1914-18, several of the tribes remained in 1940 technically at war with the United States. Indian enrolment exceeded 99% of the estimated eligibles even among the non-English-speaking groups. Large numbers of young Indians also were, in 1940, members of the national guard in their respective states and many volunteered for the armed force without waiting to be called.

Despite the reluctance of congress to arrive at any settlement of the Indian claims issue involving millions of dollars for lands taken from numerous tribes, the adjustment of two large claims in which the Indians won their cases before the court of claims was under way. The sum of \$4,599,987.02 was distributed to the Shoshone of the Wind River reservation in Wyoming, and \$5,598,635.43 to the Klamath of Oregon, under legal restrictions agreed to by the tribes which limited the use of funds to land purchases, home building and similar items of economic reconstruction for the individuals concerned.

After six years of activity under the Indian Reorganization act, 250 of the eligible tribes or groups accepted the act, of whom 132 were in 1940 chartered and were making active use of credit and other provisions of the act. Proposals for amending the act to correct some of its revealed weaknesses were pending before the congress.

However, the growing emphasis on national defence resulted in a substantial decrease in appropriations for Indian rehabilitation which affected adversely the land purchase program, rehabilitation housing, the completion of projected irrigation development for the better use of Indian resources, and other constructive efforts to provide Indians with the means and opportunity to attain economic self-sufficiency.

During the year the soil conservation activities on Indian reservations were transferred from the department of agriculture to the department of the interior and became a function of the Indian service. Past neglect and overgrazing of Indian lands have contributed seriously to the depletion of Indian economic resources and the move may be of considerable importance.

Research by the medical division of the Office of Indian Affairs over a period of years resulted in the announcement in 1938 that trachoma is a virus disease and experimentation with sulphanilamide and neoprontosil as specific in 1939 and 1940 were most encouraging. The solicitor's office of the department of the interior completed during the year a major task in the preparation of a compendium of federal laws and treaties relating to Indians, the first complete survey of this complicated subject.

(W. W. B.)

Indo-China, French: see CHINESE-JAPANESE WAR; FRANCE; EUROPEAN WAR; FRENCH COLONIAL EMPIRE; JAPAN; SIAM.

Industrial Research. In the United States during 1940 metallurgy, agricultural and organic chemical technology, petroleum and synthetic textiles, rubber and resins were the dominant fields of industrial research. British, German and soviet investigations were concerned especially with metals, coal and petroleum products, paints, plastics and foods. In Italy motor fuels, chemicals, explosives and textile fibres, and in Japan hydrocarbons, solvents, cellulose products, synthetic rubber and marine and vegetable oils were the main subjects of research.

United States.—The total expenditure for basic production research in the United States in 1940 was probably \$220,000,000. A nation-wide study was started by the Air Hygiene foundation in attempting to reduce the estimated \$900,000,000 a year lost to the industries by workers absent because of illness. The speed-up of production increases the hazards which result in many types of accidents and maladies. In a non-explosive coal-mining

process a tube placed in a hole drilled in a vein expands when under high pressure is pumped into it. The bureau of mines reported on the hydrogenation of low-rank coals from the west; a satisfactory substitute for mica is needed and "Alsilum" was being tried in lieu of mica splittings. A procedure of exploration for metal-bearing ores is based on the observation that plants growing over an ore body contain more of the metal in their tissues than plants from other places. American clays have displaced imported clays for many uses. "Duraglass" is a stronger type of glass produced by automatic control; figured wire glass is made with chromium-plated wire. Valuable increases were reported in the light transmission of optical systems produced by suitable chemical treatment, such as with 1% nitric acid solution, to produce low refractive index surface films; by following this procedure with a baking operation the glass surface is made much more durable. "Vycor" laboratory ware, which is 96% silica glass, is practically shockproof thermally; "Pyrex" highway reflector markers were pronounced successful by New York state engineers. Several new laboratories for powdered metals research were established. "Plast-iron," a pure iron powder, was announced. The National Bureau of Standards studied the corrosion of metals used in aircraft. The casting of rods and tubes from molten metal is performed continuously; wire is made by the process of slitting sheets instead of drawing metal through dies. The reduction of iron ores under pressure by carbon monoxide and the desulphurization of pig iron with calcium carbide were investigated. The output of information of all aspects of work was continued. Uranium-nickel steels appear to be quite corrosion resistant; silver-bearing 18/8 stainless steel is much more resistant to chloride solutions than the original alloy. The use of polonium in standard electrode alloys was found to improve starting performance of spark plugs. Tellurium was employed in a new electric lamp. By an electrolytic process both platinum and indium and its production in commercial quantities were possible. It is expected electrorefining of tin will attract more attention in the future. By the middle of 1942 the production of aluminium ingots will have expanded to 250% of the 1940 level. Advances were made in the knowledge of beryllium-aluminium and beryllium-magnesium alloys. Magnesium production was 13,000,000 lb. in 1940 and will be doubled by the spring of 1942.

New processes were introduced for the stabilization of iodine in iodized carriers. A molten mixture of salts consisting of sodium nitrite and sodium and potassium nitrates is a heating and cooling liquid for industrial processes requiring high temperatures, but where direct heating with an open flame is either dangerous or impracticable. The net cost of research in the field of synthetic organic chemicals was about 3½% of sales. Nitromethane, nitroethane, 1-nitropropane, and 2-nitropropane were being manufactured commercially, and later on nitro-paraffins with longer carbon chains will be available. Over 80 commercial esters of polyhydric alcohols and their ethers were reported. Normal octanol and normal decanol were available in quantities; the manufacture of adipic acid was started. The production of guanidine salts was markedly improved. Levulinic acid was now commercially available. New non-volatile, water-soluble compounds offered under the designation "Carbowax," were recommended for the paper and textile industries and as metal-working fluids. Sulphathiazole, sulphadiazine and sulphaguanidine are new members of the sulphanilamide family. Drug manufacturers were reported to be studying hydroponics for growing drug plants produced only in the orient and for raising the drug content of plants. The four regional laboratories of the U.S. department of agriculture were made ready for occupancy. Potassium metaphosphate was described as a potential high-analysis fertilizer.

erial. Better extraction of cottonseed oil was being studied; ns were being sought to produce furfural from cottonseed s and to use the residual lignin for the production of a plastic. es for plywood from cotton and soybean proteins were being eloped. Colchicine continued to get attention as an inductor polyploidy in plants. Applied in the form of a solution on- ing as little as one part in 100,000,000 parts of water, vitamin was reported to have displayed potentiality in horticulture. rmone" is a "liquid hormone spray" containing naphthalene ic acid, for use in delaying the dropping of fruit from trees l they are ready to harvest. Bactericidal irradiation was put iver use and the characteristics of the "Sterilamp" were re- ed. Food dehydration was being studied broadly. There was siderable activity in research on food antioxidation. A new hetic sausage casing consists of collagen; cholesterol was being duced commercially from beef spinal cords. The growth of re- ch effort in the petroleum industry has been rapid, having nded 539% in 11 years and having risen from seventh largest econd largest. The National Advisory Committee for Aeronau- selected Cleveland, O., as the site for the government's 00,000 aeroplane engine research laboratory. Geochemical pecting for underground oil was developed further. The ten- cy in motor fuels is toward the production of single hydro- ons or a group of three or four in order that the combustion utomotive engines may be precisely controlled. The new lyform" process combining polymerization with cracking was losed. At least ten petroleum refineries were using bauxite for ching paraffinic oils. Naphthenic acids extracted from lubri- g oil fractions became commercially available. Development of new ments for lumber is particularly important because much timber cut ond growth, which may have a large proportion of sapwood, thus mak- ore susceptible to staining. Urea was being used as an aid in sea- g lumber; wood can be easily bent by treatment with urea. Lignin has eferred to as the "greatest economic waste in the world today," and ys can be found to hydrogenate lignin cheaply it may become the source whole new series of organic compounds. Newsprint was produced from ern yellow pine at Herty, Tex.; the U.S. Forest Products laboratory are newsprint by mixing unbleached semi-chemical pulp from southern ees with groundwood pulp from southern pine, and at Syracuse ersity newsprint was made from red pine. "Velo" cold-set ink and nickel ere described; isophorone was used in improved inks, stencil pastes roll-coating finishes. Research was in progress on the production of ng paper from low-grade cotton; paper made from cotton burs and stalks nder test in Texas. The U.S. Institute for Textile Research published e results of a broad program of textile-drying investigation; the U.S. de- ment of agriculture contributed a new process for sterilizing textile s. Uses for cotton discussed by the National Cotton council, which is orting extensive investigation at Mellon institute, included bale cover- stabilizing road cuts and fills, protecting tree seedlings and beehives, for peanuts and fertilizers, and plastics. "Vinyon" is being utilized in making a variety of felts. The production announced of "Vinyon" yarn of 74% greater tensile strength than ously available. Thirty-six mills were licensed to make nylon hosiery, plans were approved for a second plant for the manufacture of nylon t Martinsville, Va., with full operation scheduled for the spring of . Dot patterns were being applied electrostatically on dress goods. The ed States manufactures 96% of its dyes. Dehydrated castor oil is aying potentialities in the manufacture of quick-drying paint and ish; tung oil is being deodorized. Road performance and life studies w-pressure tires have shown a doubling of mileage since 1927, gains ted through research in materials, design and construction. Electrically uctive rubber is being commercialized. In so-called rubber synthesis rchers are not building a replica of nature's product but are shaping ific molecules to meet particular needs. About 2,000 tons of synthetic er were produced in this country during 1939 and around 11,000 tons e made in 1940; plans call for the production of at least 20,000 tons bber substitutes by the fall of 1941. A new process deep-draws sheets ellulose acetate into various shapes. Outdoor furniture was made of en extruded cellulose acetate-butyrate moulding composition. The use hyl cellulose, benzyl cellulose, as well as "Vinylite" in commercial f- rings was reported. A training monoplane was built with phenolic- egnated spruce plywood, the army air corps evolved a Bellanca tic plane" whose wings are formed plywood, bonded with a self-setting l. Tractor seats moulded from a soybean protein-formaldehyde plastic e in production. The output of "Vinylite" resins was increased ve- times and will be tripled by a new plant. Calendered "Vinylite" sheets e applications as rubber and leather successors, particularly in articles ture. The development of collapsible tubes formed of vinyl sheet rial was reported. "Saran," a vinylidene-chloride thermoplastic resin, e employed in the manufacture of synthetic rattan. The production of mine resins ("Melamac"), especially for laminating and surface coat- was announced.

Canada.—The National Research council was in 1940 working in close operation with the department of national defence and the war supply d. Investigations were being made on textiles for military purposes and

on the development of paints for the detection of poison gases; gas-mask equipment was being examined. Oil-dilution studies of aeroplane engines were carried out; Canadian engineers were building an electric aeroplane, powered by light-weight storage batteries. Research reports appeared on chromium-molybdenum steels and on phases of powder metallurgy; an investigation of uranium as an alloying element was going forward. Canada leads the world in platinum production by the treatment of nickel-copper matte at Sudbury. The principal development in the chemical field was the establishment of a large explosives plant at Fraser, Ont. A new process was described for the manufacture of acetic anhydride from acetaldehyde. The National Research council studied agricultural alcohol as a motor fuel. New ways of processing wood to provide raw materials for organic synthesis were described. Textile-plant modernization received much attention. The metallic contamination of foods was given research, and work on milling and baking quality of wheat and malting quality of barley was part of a program of co-operative investigation.

Brazil.—The government established the Instituto Nacional de Tecnologia to study the use of Brazilian raw materials. Companies in São Paulo contributed under a fellowship scheme for the maintenance of the Instituto de Pesquisas Tecnológicas. The ministry of agriculture was stimulating the use of fertilizers. Sacks made of caroa fibre were reported to be 50% lighter than those of jute; another substitute for jute (macambira) can be employed in manufacturing canvas and carpets as well as bags. The demand for oiticica oil in the United States has greatly benefited the main producing state of Ceará; cottonseed cake was being used for foodstuffs and fertilizers. The Departamento Nacional de Café acquired a little plant in which to experiment on the production of a plastic, "Cafelite" and oil from coffee by the Polin process.

France.—Oxygen supply in air-raid shelters was studied. The government ordered the industrial utilization of wastes of all sorts; lubricating oils were regenerated and volatile solvents recovered generally; specifications for aviation-engine oils were published. Hydrogen from ammonia was put to trial as a motor fuel.

Belgium.—A pickling process in successful operation had for its active agent ferrous chloride. Government tests showed that a supersulphate cement, "Sealthor" made from granulated blast-furnace slag, slaked lime and calcium sulphate, was a little stronger than portland cement.

Netherlands.—Investigations in the low-temperature regions made accessible by the adiabatic demagnetization method were described in a treatise issued by the Kamerlingh Onnes laboratory at Leiden. Research was conducted in trying to make a textile fibre from the waste gases of a cracking plant. "Brocafil," a suture material, was prepared from the collagen of tendons.

Great Britain.—The Department of Scientific and Industrial Research, which celebrated its 25th anniversary, published economical type designs in structural steelwork for factories. Activity in the chemical industry was shown by the expansion of various companies. The Fuel Research board announced details of its work on the design and development of a retort for producing free-burning, smokeless fuel. In the Perrin process low-carbon steel ingots can be manufactured directly from the acid converter with a pig iron too high in phosphorus for the normal acid Bessemer process. Melting operations in the non-ferrous industry and the rolling of magnesium were investigated. A new process, the "Barimar," was announced for welding together steel and aluminium. Glass curbs, making highway edges stand out more clearly at night, were being tried. "Spectra-lite" is a plate glass that has a colour-tone in harmony with the goods to be displayed in a window. In 1914 no scientific glassware was made, but in 1940 a wide variety was available. The government appointed committees on synthetic processes for the production of oil from coal, low-temperature carbonization, liquid products obtained by high-temperature carbonization, alternative fuels for internal combustion engines, "col-loidal" fuel and efficient use of fuel in wartime. Camouflage grew lustily through paints and coloured roofings; latex paints were applied to windows to reduce damage from explosions.

Improvements were effected in mould-making machinery, in luminous mouldings, in printing and painting moulded plastics ("Tapinex" process), and in electrodepositing metals upon resins ("Menomat" process). Activity in cellulose acetate plastics was marked, among the products being sheets for aircraft screens, gas-mask eyepieces and transparent containers. A rayon-like fabric was prepared from seaweed. The production of nylon yarn was postponed by the war, but nylon was developed for brush bristles, surgical sutures and fishing casts and lines. The dyestuff industry was in 1940 eight times larger in output than in 1914; dye makers in fact supplied in 1940 upward of 90% of the requirements. The Department of Scientific and Industrial Research opened a new water research laboratory at Watford. Co-operative with the industries concerned, investigations were conducted on river pollution by beet sugar and milk factory effluents. "Macon" is a cured mutton or lamb. A small-scale plant to dry food-stuffs was in operation at the low-temperature research station. The application of latex to highway and floor surfacing was investigated in Malaya; the preservation of latex by sterilization in the presence of buffer solutions also was studied. The Rubber Research Institute of Malaya suggested the use of fermented coco-nut milk as a coagulant for latex because of the shortage of formic and acetic acids.

Norway.—A plant was erected in Oslo for experiments on the recovery of potassium salts from sea water. "Fullgjodsel" is a new compound fertilizer of three types. The possibility of producing refractories from Norwegian raw materials was investigated.

Sweden.—Electrification on a wide scale and inventions of national importance were being promoted by the government. A new wood preservative consists of zinc and chromic arsenates. The toxicology of cadmium fumes was studied. A novel type of elastic concrete sections was put to practical use; the "Metalty" process involves the electroplating of ceramic products with thin layers of soft metals. The Svedlund wood-gas generator is claimed to enable burning even fresh-cut wood as a source of motor fuel. Colchicine was applied in producing "giant" trees of larch.

Germany.—Standardization proceeded throughout many industries. Studies were made of occupational arsenic, thallium, nickel carbonyl, carbon disulphide and naphtha poisoning; data were published on the ex-

plosion limits of industrial gases and solvent vapours; research was conducted on the prevention of acetylene-air explosions by the addition of inert gases. There was a resurgence of investigation on the improvement of the usefulness of wood by water-, mould- and flameproofing; standards were laid down for flameproofing agents. Gas warfare and air defence were studied; it was concluded that artificial smoke forms the best means of protecting a city from air raids. The high-pressure carbonyl process for extracting nickel from matte is regarded as an important metallurgical achievement. The sintering of metal powders, or "metal ceramics," especially of nickel, was under steady development. The zinc industry recorded expansion and modernization of equipment. A caustic extraction method was developed to obtain alumina from clay; phonolite was under renewed investigation as a source of aluminium. The consolidation of soil by the employment of aluminium electrodes is said to be applicable to clay soils. Plastic products replaced many bronze bearings and gears, and aluminium and magnesium alloys were being employed instead of bronze in the manufacture of worm gears. In recent years the potash industry has been reorganized, resulting in a simplification of its structure and a broadening of interests of the producing companies to fields distinct from potash, such as the manufacture of petroleum products and of magnesium and its alloys. Blast-furnace slag was investigated as a raw material for glass manufacture and the resistance of glass to chemical corrosion was improved by zinc oxide. A new safety-glass interlayer is a plasticized butyral of a vinyl acetate and dimethyl maleate copolymer. Production of fats from coal reached 35,000 tons yearly. Luminescent paints and plastics were used on valves, gauges, stairs and pillars of factories subject to air raids. Black-out of buildings was accomplished by orange illumination and windows painted in the complementary colour, light green.

New processes were developed for making cellulose from pine. Ultra-violet and X-rays were found to accelerate the growth of poplars. New forms of the "Igelits" were evolved, especially for the clothing industry; "PeCesilk" is one of these products. "Pe-Ce," or rechlorinated polyvinyl chloride fibre, placed in full-scale production during 1940, was being used in fish nets, rope, and protective clothing. "Perluran" is a synthetic fibre made under a process similar to that followed in the production of nylon. The output of the pioneer synthetic rubber plant was twice that of 1939 and the construction of a second large plant was reported. The manufacture of transmission belts from cellulose triacetate sheets was reported an outstanding success. "Plexiglas" was being used in making shoes and superseded silicate glass in aeroplanes. The explosive P.E.T.N. is made from formaldehyde, acetaldehyde and nitric acid; pentaerythritol is the starting material for the production of tetranitropentaerythritol, the basis for composing a variety of explosives. To expand the nation's agricultural yield to maximum levels by rationalized application of fertilizer, all farmers upon request are required to submit to authorities samples of their soil for analysis. Tinless, phosphated steel cans were being produced extensively. Fodder yeast was cultivated from sulphate liquor under industrial conditions; experiments in the production of fodder albumin from calcium carbide were represented as successful.

Switzerland.—There was research activity in the fields of aluminium, dyestuffs, textile chemicals and pharmaceuticals. Reports on the biochemistry of silicosis were issued by the International Labour office.

Italy.—At the University of Naples 25 occupational diseases in chemical industry were studied. To save nickel, stainless steel was used in coin making; the scarcity of copper was being met mainly through the use of laminated zinc and zinc alloys. It is said that the switch from copper sulphate to copper oxychloride for use as a fungicide in vineyards effects a saving of 35% in the amount of copper used. Bromine from sea water, tetraethyl lead, iodine and potassium permanganate were produced for the first time. The condensation of furfural and urea was investigated; lignin from sorghum residue is regarded as a source of plastic material; three companies were in 1940 manufacturing synthetic rubber. New projects furnished 50% of the cellulose requirements. About 30 qt. of milk are needed to make the casein for a "Lanital" dress; "Lanital" was used to the extent of 30% with wool in the clothing for soldiers. "Railan" is a fibre made from a viscose and casein mixture. By the Talcig photochemical process direct reproductions of costly woods can be obtained on other materials.

U.S.S.R.—The Institute of Halurgy was investigating the production of natural soda. Studies were continued on the underground gasification of coal and Volga shales. Phonolites and nephelitic syenites were being utilized in glass manufacturing. Research appeared on the nitroreduction of steels, the composition and structure of "Stalinite," and chromium-silicon and chromium-manganese alloys. Work was performed on cast magnesium alloys with increased corrosion-resistant properties. The production of acetylene from methane, by cracking in the electric arc at low pressures, was studied. Polydiene rubber and the oxidation of synthetic rubbers were investigated. Researches were made on the electrocatalytic process of sterilizing fruit juices, on the caseins of various domestic animals and on the use of beebread in foods.

Palestine.—At the Hebrew university supersonics were being applied in the sterilization of orange juice. Impregnated wrappers reduced decay one-fifth to one-sixth of that in oranges packed in the ordinary way.

Union of South Africa.—Manufactures needing development are coal products, motor fuel, sugar and fermentation. The chemistry of the Fischer-Tropsch process was studied; colloidal lead stabilized with 0.25% rubber was found to impart antiknock properties to gasoline.

India.—Research was in progress on the processing of mica for insulation purposes. In decolorizing china clay, hydrochloric acid treatment appears to give the most promising results. The Industrial Research bureau was pursuing investigations on casein plastics, uses for lactose, application of vegetable oils as lubricants for internal combustion engines, improvement of red lead pigments and paints, effects of molasses on lime-cement mortars and employment of artificial pyrolysis in dry clays. A plastic was made from shellac and casein and a shellac-urea-formaldehyde moulding powder was under development. At the Imperial Sugarcane Breeding station, Coimbatore, cane was crossed with bamboo; the Imperial Council of Agricultural Research evolved better yielding varieties of rice. The Indian Central Cotton committee drew up a program of work that included cotton

for road making, cotton cloth for bagging cotton bales, and for wall paper absorbent cotton and artificial leather. The manufacture of rayon was being studied basically. The Forest Research institute, which has shown a plentiful supply of tanning materials, was aiding the leather industry.

Japan.—More than 50 government laboratories, universities, private groups and scientific societies issued research reports. Word came of ammonia sulphophosphate fertilizer. A new base-metal catalyst was under development for the oxidation of ammonia to nitric acid. The technochemical problems of alunite were being investigated and research was continued on the preparation of alumina from Manchoukuoan clay. The invention was recorded of a hard aluminium alloy for sword blades and cutlery. The searches were extended on the influence of added substances on the setting of portland cement. The first petroleum well in Manchoukuo had sufficient yield to spur other test borings. Fushun canal coal was found to be a good source of carbon; oil-shale of Manchoukuo yields 100,000 tons of liquid fuel annually. Research was conducted on the synthesis of motor fuel from carbon monoxide and hydrogen. The finance ministry's laboratories perfected a process for producing anhydrous alcohol from calcium carbide; research was carried out on the hydrogenation of soft-wood lignin. A heavy substitute was produced from banana skins; "Somite" is a plastic material factored from fibrous waste by the viscose process; a way to impregnate fibres with a protein coating obtained from soybeans was patented. A spinning company announced the development of three synthetic fibres; a department of commerce and industry planned to establish a laboratory for nylon research; "Nippolan" is an undescribed wool substitute. "Thion A" is a rubber-like material derived from formaldehyde; "Hitakol No. 1" is a polysulphide elastomer. Brown factice prepared from polymerized sardine oil was studied comprehensively; a substitute lubricating oil was produced by polymerizing sardine oil. Lubricating oils of high viscosity have been synthesized by catalytic decomposition of chlorinated fatty acids.

Australia.—The economic cabinet of the commonwealth government, which has a division of industrial chemistry as a branch of the Council of Scientific and Industrial Research, planned a laboratory at Melbourne at a cost about £50,000. Progress was made in arrangements for the erection of a national standards laboratory and an aeronautical research laboratory. At Newnes, the Council for Scientific and Industrial Research was exploiting oil-shale and expected to obtain gasoline at the rate of at least 10,000,000 gal. a year. The council published a bulletin summarizing chemical investigations on sheep fleece and announced a process for rendering wool "unshrinkable," based upon the finding that certain concentrations of alkali properly applied, will reduce the capacity of wool to shrink and felt.

New Zealand.—A systematic search was being made in 1940 for raw materials for industrial utilization, particularly important minerals. The Department of Scientific and Industrial Research maintains contact with manufacturers through associations such as those formed for wool, tanning and shoe companies. (See also CELLULOSE PRODUCTS; CHEMISTRY; CHEMISTRY, APPLIED; CHEMISTRY AND ENGINEERING, AGRICULTURAL; U.S. BUREAU OF; CHEMURGY; PLASTICS INDUSTRY.) (W. A. HA.)

Infantile Paralysis. The year 1940 was one of the worst years for poliomyelitis, with great numbers of cases occurring in Iowa, Michigan, West Virginia and Indiana particularly. Major epidemics appeared also in the Pacific northwest and the south Atlantic areas. The first outbreak of 1940 occurred in Tacoma, Wash. Poliomyelitis of 1940 was of the type that attacks those parts of the body concerned in breathing.

The National Foundation for Infantile Paralysis held its annual meeting late in Nov. 1940. Special committees reported on various aspects of the control of this disease.

Virus.—The Committee on Virus Research reported that studies were being conducted to determine the nature of the poliomyelitis virus. Paul Clark, Ph.D., the University of Wisconsin, has concentrated the virus in infected material obtained from spinal cords of monkeys so that infection may be produced in dilution of one part to 10,000,000. Dr. Hubert S. Loring, Leland Stanford university, concluded that the virus is produced in nerve tissue.

Drs. John R. Paul and James D. Trask, Yale university school of medicine, reported the finding of the poliomyelitis virus in stools of patients in contact and in sewage collected from epidemic areas. Dr. S. D. Krametz, Michigan department of health laboratories, reported the occurrence of healthy carriers in an institutional outbreak in Detroit.

Reports were made of the efforts to produce infection with poliomyelitis viruses in animals other than the monkey. This confirmed the previously reported findings of Armstrong to the effect that the Lansing strain could be made to produce infection in various cotton rats. All investigators, excepting Dr. John A. Toomey of the Western Reserve university school of medicine, reported that only this one strain could be made to produce disease in the cotton rat. Toomey, however, had success in growing, by a special technique, several other old as well as newly isolated strains in the cotton rat.

The distribution of the virus in the body was reported by Drs. R. L. Lillie, the National Institute of Health in Washington; Albert B. Sabers, University of Cincinnati; John F. Kessel, University of Southern California and others. All showed that the virus could be routinely recovered from central nervous tissue of human fatal cases and from experimental animals and that excepting for tonsils, adenoids and lymph gland tissue, no other part of the body was shown to harbour the infection.

Immunity.—All attempts at producing immunity have thus far met with failure. Dr. Kessel reported that one infection did not routinely protect monkeys from subsequent disease on re-inoculation.

After Effects.—Dr. Donald Young Solandt, University of Toronto, concluded that the muscular fibrillation resulting from nerve destruction was not the primary cause of atrophy of paralyzed muscle. Dr. Clinton

alsey, Johns Hopkins university school of medicine, concurred in these its, but Dr. Samuel Soskin, Michael Reese hospital in Chicago, felt in the animals which he studied fibrillation did play an important part e degree of atrophy resulting from nerve destruction.

ross and microscopic pathologic studies of paralyzed muscles carried y Dr. Herbert E. Hippos, the Crippled Children's hospital in Marlin, y, showed that occasionally muscles developed a band-like form of eneration and that when mattress sutures were used to connect the cle above and below these bands, good functional results were obtained. everal instruments were presented for the more accurate testing of cle strengths. Dr. A. A. Schmier, the Hospital for Joint Diseases in r York city, developed a muscle tester and recording apparatus suitable measuring in pounds and ounces the pulling power of most of the cles of the body. Dr. Leo Mayer of the same hospital developed a table gned to evaluate in the same terms the muscle power of the trunk.

urgical Treatment.—Drs. George E. Bennett and Raymond E. Lenhard, Children's Hospital school in Baltimore, concluded that if the maximum efits of physiotherapy are to be secured, patients must be under such within six months of the onset. They further showed that 97% of all ened or paralyzed muscles regain the maximum possible strength in 18 months after onset of treatment.

he value of rest treatment was further emphasized by laboratory ies on infected monkeys. Dr. Sidney O. Levinson, of the Michael Reese pital in Chicago, showed that monkeys forced to exercise during the ve disease process had not only a greater amount of paralysis, but also gher death-rate. (See also BACTERIOLOGY.)

BIBLIOGRAPHY.—*Bulletin*, National Foundation for Infantile Paralysis, (M. Fr.)

ant Mortality. There were 108,532 deaths of infants under one year of age in the United States 1939. Since 2,262,726 births were registered in that year, the ant mortality rate resulting was 48 per 1,000 live births. Canada, with 13,920 deaths under age one and 229,063 births, had infant mortality rate of 61 per 1,000 live births in 1939, while England and Wales recorded 30,927 infant deaths and 620,257 hts, so that the infant mortality rate amounted to 50 per 1,000 e births. For each of these countries, the infant mortality rate 1939 was the lowest on record. Thus, in the United States, the e for 1939 was 6% below that for 1938, when there were 51 hts under age one per 1,000 live births. Compared with 1915, en the rate was 100 per 1,000 live births, the figure for 1939 esented an improvement of more than 50% in a period just e year short of a quarter century. Provisional indications are t infant mortality in 1940 will be even lower than that of 1939. In the case of Canada, infant mortality in 1939 marks a uction of 41% from the figure for 1921 (102 per 1,000), the t year of record for the dominion. The extent of the improve- nt in infant mortality in most western countries since the be- nning of the century is exemplified by the experience of England d Wales. In that country, the infant mortality rate fell from 4 per 1,000 live births in 1900 to 50 in 1939. The principal ctors contributing toward this improvement were better sanita- n and the general rise in standards of living. Factors are the teurization of milk, systems of food inspection, the screening d dwellings to keep out flies, the organization of agencies that ovide prenatal and neonatal care and the education of mothers e feeding and care of infants.

There is a wide variation in infant mortality among the coun- es of the world. Countries with exceptionally low infant mortal- rates per 1,000 live births in 1939 were: New Zealand (31), e Netherlands (34), Sweden (39) and Switzerland (43). On e other hand, infant mortality rates of over 100 per 1,000 live hts in 1939 were found in Chile, Bulgaria, Hungary, Lithuania, exico, Rumania, Portugal and Palestine. Infant mortality is o undoubtedly high in many other countries for which adequate rds are not available.

Infant mortality also varies widely within the United States. us, in 1939, when the rate for the country as a whole was 48 r 1,000 live births, the following states had rates of less than e Connecticut (36.3), Massachusetts (39.9), Minnesota (38.8), rbraska (36.4), New Jersey (39.5), Oregon (39.2), Washington 3.7). The highest infant mortality rates were found in Arizona 3.8) and New Mexico (108.7).

Annual Infant Deaths per 1,000 Live Births in Certain Countries for 1939 and for Each Year in the United States from 1915 to 1939 and in England and Wales from 1900 to 1939

Country	Infant Deaths per 1,000 Live Births 1939	Year	Infant Deaths per 1,000 Live Births

(a) Infant mortality rate for 1938.

(b) Infant mortality rate for 1937.

(c) Infant mortality rate for 1935.

(d) Official data begin with 1915. For years prior to 1933, the infant mortality rates relate to an expanding birth registration area within the United States.

Deaths among infants are concentrated principally in the early part of the first year of life. Thus, in the United States in 1938, of all deaths under age one year, 27.7% were in the first day of life, 46.5% in the first week, 58.0% in the first month and 85.0% within the first six months of life.

About four-fifths of the deaths in the first year of life in 1938 were ascribed to only nine causes of death. They were: congenital malformations, with 4.5 deaths per 1,000 live births; congenital debility, with a rate of 1.4 per 1,000; premature birth, 14.3; injury at birth, 4.4; pneumonia (all forms), 7.0; diarrhoea and enteritis, 5.0; whooping cough, 1.4; influenza 0.9 and external causes 1.0.

Among white persons in the United States, the infant mortality rate in 1938 was 47.1 per 1,000 live births, while that for Negroes was 79.1 per 1,000. (See also BIRTH STATISTICS.)

Initiative and Referendum. The year 1940 was fruitful of proposals. Louisiana voted on 32 but rejected 13; California, 17, rejecting 9; North Dakota, 13, rejecting 7.

A constitutional convention proposal was rejected in Iowa (352,142 to 199,247). Panama (144,312 to 1,865) and Paraguay (159,717 to 13,367) each adopted a new constitution. Hawaii voted (46,174 to 22,428) for statehood. Arizona rejected (60,531 to 20,981) proposed definition of public service corporations. Oklahoma voted (256,456 to 210,890) to forbid such corporations to merge with competitors. Bank stockholders' double liability was repealed in Washington (355,047 to 188,929) and Indiana (355,578 to 267,589), which also repealed (344,262 to 229,370) 20-year limitation of banking charters; but retained in Oregon (191,290 to 157,891) and authorized in Utah (81,679 to 11,873).

Nevada voted (22,524 to 8,683) to require a majority of votes at an election, to abolish a county. County manager was authorized in North Dakota (67,804 to 64,519); rejected in Nebraska (254,639 to 179,600) and Fairfax county, Va. (4,537 to 1,148). Arizona voted (58,149 to 41,215) per capita tax of \$65 for common, and \$95 for high schools; Montana (58,968 to 52,998) 3½ mill tax increase for state university and branches, rejecting (67,197 to 51,921) bond issue for state college buildings. Arkansas authorized (107,115 to 56,500) 1 mill city library tax. Many Ohio rural areas voted to "centralize" school districts. South Dakota voted (149,486 to 193,013) against transferring permanent school fund administration from counties to state. Louisiana adopted (140,543 to 133,876); North Dakota rejected (71,101 to 53,908) proposal to reorganize financial administration. Idaho rejected (88,738 to 53,158) loan of permanent endowment funds on farm property, but approved (86,328 to 50,029) federal disbursement method.

Highway funds were made non-divertible in Idaho (108,358 to 41,148), Nevada (28,679 to 6,831), North Dakota (91,149 to 49,324), Oklahoma (355,431 to 198,100) and South Dakota (142,782 to 109,259). Sales tax was voted by North Dakota (77,962 to 55,810) earmarked for schools and relief (79,393 to 52,731). Louisiana voted (152,437 to 41,024) not to prohibit sales tax. Oklahoma voted (408,599 to 196,711) a graduated land tax, with exemptions. Maryland voted (131,330 to 67,456) against exempting judicial salaries from income tax. Colorado rejected both income (366,049 to 81,787) and intangible property tax (440,202 to 50,806). Washington voted (390,639 to 149,843) 40 mill, general property tax limit, with exceptions; Michigan (843,159 to 602,952) and Arizona (42,748 to 41,696) rejected proposed tax limitations.

Oregon voted (183,488 to 129,699) against fixing tax base at average of three years' levies. Exemptions were rejected in Arizona (42,748 to 41,696, "tax free homes"); Arkansas (97,267 to 68,314, \$100 chattels) and Louisiana (manufacturing plants, 142,319 to 125,573; "electric co-operatives," 146,025 to 121,386). Arizona voted (53,124 to 37,856) vehicle license tax, excluding all others thereon. South Carolina voted (30,762 to 11,664) biennial levy of annual taxes. Missouri voted (535,642 to 445,194) non-partisan judiciary; Maryland "people's courts" (172,616 to 72,371), an additional circuit judge (117,594 to 68,923) and authority for the court of appeals to appoint its clerk (121,080 to 73,653); West Virginia rejected (300,979 to 133,256) "reform judiciary amendment," substituting summary courts for justices of the peace and constables. Texas voted (268,645 to 114,343) direct appeals to supreme court on certain questions. California rejected (1,082,647 to 723,330) elaborate judiciary amendment, affecting jurisdiction, judicial councils, appeals, etc., and another for court review of administrative tribunal rulings (921,832 to 907,761).

Oklahoma voted (294,346 to 212,701) to limit powers of medical examiners. Philippines restored bicameral legislature (1,043,712 to 275,184). South Carolina approved (29,633 to 8,560) biennial legislative sessions and also special ones (30,901 to 10,107); New Mexico (31,490 to 8,560) two 30-day sessions with a 30-day interval between; California (929,527 to 855,845) interim legislative committees, rejecting (1,268,684 to 556,469) annual sessions and budget. North Dakota rejected (64,636 to 61,573) amendment facilitating use of referendum, excluding veto and repeal by legislature. Oklahoma voted (354,433 to 169,196) to require state officers to have been electors therein for a decade. Philippines removed presidential one-term limitation and allowed re-election (1,072,039 to 240,632). South Dakota voted (140,465 to 97,748) against authorizing governor to fill legislative vacancies; Oregon against (188,030 to 186,830) increase of legislative salaries. Prohibition was retained in Oklahoma (374,911 to 200,752) and Prince Edward Island (10,426 to 8,861). Oregon rejected (309,183 to 90,681) private sale and also further restriction of liquor traffic.

The dispensary was rejected in Johnston county, N.C. (7,579 to 3,956) and Talbot county, Md. (3,672 to 705); county option (112,972 to 70,544) and restriction (102,186 to 79,563) in Idaho. The merit system of appointments was approved in Kansas (428,739 to 241,582), Louisiana (147,380 to 128,024) and Michigan (706,764 to 709,894); and rejected in Omaha, Neb. (55,475 to 38,779). Texas voted (222,559 to 147,919) to relieve municipal civil service positions from two-year term limitation. Lima, O., voted (7,330 to 6,828) to improve civil service administration. Tennessee rejected (171,209 to 77,614) extension of governor's term (favourable vote was not a majority of all cast). Maryland rejected (170,581 to 93,124) amendment to prevent governor succeeding himself. Oregon repealed (213,797 to 163,942) term limit for certain state officers; Washington rejected repeal of two-term limit for county officers (267,938 to 208,407). Arkansas rejected (96,628 to 70,131) amendment permitting appointed officers, filling vacancies, to succeed themselves. (C. S. L.)

Insurance, Accident and Health. Accident health insurance experienced its best year in 1940 with premiums estimated in excess of \$275,000,000, a gain of \$33,000,000 or 13%. Hospitalization insurance contributed much to this gain, although uncertain economic conditions made the public more receptive to insurance to protect earnings. Although non-profit hospitalization companies made rapid strides in large cities, regular companies were in 1940 writing a large volume of hospitalization. Underwriting hospitalization on a sound basis was complicated by people anticipating the need for an operation or hospitalization, both insurance. This was particularly pronounced among workers necessitating the insertion of waiting period clauses before benefits become effective on rectal cases, tonsillectomies, appendectomies and female diseases.

Consideration was being given the exclusion of liability for injuries caused by "war or any act of war" because such injuries might develop to serious proportions if the United States should enter the war. For patriotic reasons coverage for draftees, volunteers, national guardsmen and reserve officers entering service was being generally continued without applying war clause restrictions or charging extra for the change of occupation, despite the increase in hazard.

Increased industrial activity as a result of the national defense program undoubtedly accelerated industrial accidents and the concentration of people in industrial centres and army camps increased the possibilities of epidemics. Both situations were being viewed with caution.

Great Britain.—The year 1940 presented many problems in the field of accident and miscellaneous insurance, and the business in the United Kingdom was overshadowed by the war. The results of the accident business of British offices for 1939, which were published during 1940, did not fully reflect the influence of the war, and premium revenues were on the whole well maintained.

Workmen's compensation insurance is the one important section likely to maintain its volume. This business is directly related to the course of industry, which under present conditions is fully engaged, with wages increasing in the aggregate. During the year a new act—the Workmen's Compensation (Supplementary Allowances) act, 1940, was passed increasing the weekly payments to injured workmen. Premiums were increased by from 10% to 25% to meet this increased liability.

War risks are not insured through the accident department except to a small extent to cover personal injuries. The Personal Injuries (Emergency Provisions) act, 1939, relieves employer's liability to compensate their employees in case of injury by war risks and also provides compensation to civilians incurring injury. (See also INSURANCE, AUTOMOBILE: *Great Britain*; [CASE]: *Insurance*.)

(C. E. G.)

Insurance, Automobile. The trend toward higher automobile casualty loss ratios which started in 1939 continued throughout 1940. This was particularly true of property damage coverages, where a combination of extremely low rates, a relatively high accident frequency, and increased costs of repairing late model automobiles caused reinsurance companies serious concern. It was generally felt that this trend would continue. Premium volume was generally unchanged for 1939.

There was very little change during 1940 in the coverages extended or in the rate levels as respects automobile casualty losses, but in the fire, theft and collision field there were sizable reductions for fire and theft and a policy revision which widened the coverages and clarified the contracts. Fire and theft results continued to be satisfactory.

A very noticeable trend in the automobile casualty business during 1940 was the widespread adoption of assigned risk plans to provide insurance for automobile owners who could not secure coverage through the regular channels. Most of these plans were set up voluntarily by the companies without legislation or state control. There were probably fewer regulatory laws passed in 1940, but it was becoming increasingly evident that future years will bring additional control. Most notable along this line was the strong agitation for compulsory automobile insurance statutes of the type now in force in Massachusetts. (G. E. Ho.)

Great Britain.—Motor insurance was attacked from many angles as a result of the war. The number of private cars was greatly reduced, and the use of commercial vehicles much curtailed. The yield in premiums is bound to be much lower in 1941, though there was in 1940 some lessening in the claim ratio since the public became more accustomed to black-out conditions. Another adverse factor was the loss of business due to events in Europe. During the first half of 1940, Norway, Denmark, Holland, Belgium and France were overrun by Great Britain's enemy, and trading with those countries became illegal. British offices had important connections in all those countries dealing largely with motor insurance and personal accident insurance, all of which were lost for the time being. In addition, the entry of Italy into the war interrupted many accident negotiations with that country both direct and by reinsurance.

(C. E. G.)

Insurance, Fire. The story in regard to fire insurance, so far as results are concerned, was practically the same in 1940 as it had been since 1938. This means that the losses bore a low ratio, comparatively speaking, to the premiums and so the business had a period of comfortable returns, if not of undue prosperity. All forms of insurance are affected in their income by the decrease in the returns from investments. In the case of fire insurance, however, this is not so important a matter as in the case of life insurance, because approximately 90% of the income of fire insurance companies is derived from their premium receipts.

The best statistics available for all carriers—stock, mutual, reciprocal exchanges and Lloyd's organizations—show that during the year 1939 the premiums written amounted to \$961,806,000 and the losses paid to \$396,605,000. This means a loss ratio of 41.1% paid to premiums written of 41.1%. It should be pointed out that the phrase "premiums written" does not mean that that amount of money is received for the business, because there will be many cancellations or policies not taken—one thing or another will happen to make the premiums received less than the premiums written. That, however, is the customary way of stating the statistics in regard to premiums and is the only way it could be done on an annual basis.

There are premium receipts from sources other than strictly fire insurance business which should be mentioned because the business is often by much the same group, especially among the stock companies, as write fire insurance. About five years ago there was developed the Extended Coverage Endorsement which insures the policyholder against several forms of loss other than fire and lightning. Prior to this development it was customary to have individual policies for most of these forms; the extended coverage makes necessary only one piece of paper. This has resulted

in an increase in premiums to a certain extent, although the Extended Coverage Endorsement has not produced all new business, since in some parts of the country, for instance where windstorms are quite prevalent, a large amount of windstorm insurance was always carried and is merely merged in the all-inclusive cover. At the same time it is safe to say that the premium receipts have been increased by about 5% over the regular fire and lightning premiums. As this general form was not by Jan. 1, 1941 in full service, a larger increase from it might be expected. In one territory where the fire and lightning premiums receipts were approximately \$1,750,000, about \$100,000 was received from the Extended Coverage Endorsement. The steady tendency in the business in 1940 was to broaden the cover—to include many hazards in the one policy. (See also FIRES AND FIRE LOSSES.) (E. R. H.)

Insurance, Life. Legal reserve life insurance companies of the United States and Canada continued to make progress during 1940. The total amount of life insurance (excluding reinsurance) in force in these companies at the end of 1940 was estimated at nearly \$124,000,000,000, or an increase of about 3% over 1939. The new (original) business issued during the year amounted to about \$12,000,000,000. At the end of 1940 the assets of the companies amounted to more than \$33,000,000,000, while the payments made during the year to policyholders and beneficiaries totalled almost \$3,000,000,000.

The mortality experience during 1940 was favourable. Mortality from pneumonia declined to a new low in 1940, an achievement credited largely to the recent advances in chemotherapy. The downward trend of the tuberculosis death rate was maintained, and the principal communicable diseases of childhood also showed lower death rates. Safety campaigns aimed at preventing automobile accidents helped to keep automobile fatalities at a relatively low level. The interest rate earned on the companies' assets continued on a downward trend during the year, reflecting to an increasing degree the low rate of return obtainable in recent years on new investments. The low interest rate earned by the companies is necessarily reflected in a higher cost of insurance. During 1940 the yields on highest grade bonds, both government and corporate, reached the lowest points in history. Company holdings of United States government securities continued to increase and in 1940 comprised about 20% of the companies' assets. Generally speaking, the companies continued to experience difficulties in finding an adequate volume of appropriate and remunerative investments for their new funds.

The possible repercussions of the war in Europe necessitated some action by life insurance companies (particularly those in Canada) with respect to new insurance. This action was required because premiums charged for life insurance in normal times do not contemplate, and make no provision for, the hazard involved in insuring a great group of men likely to engage in military or naval service in time of war. Only a very small portion of the life insurance policies in force in companies of the United States and Canada in 1940 required the payment of extra premiums or contained limitations of the life insurance benefit in the event of war service. However, while life insurance companies will absorb the war risk on practically all of their existing policyholders, the safety of the insurance of such policyholders demands that the companies keep them secure, either by providing for the payment of an extra premium or by limiting the life insurance benefit in the case of new policies to be issued to those subject to military or naval service in time of war. This is a risk which, to a limited extent, should be undertaken by the government.

It was in recognition of such a limited obligation that the United States government undertook, during the World War of

1914-18, to provide insurance protection for men in the armed services. The principle of that legislation is found in the National Service Life Insurance act of 1940, under which the government again enabled the men in the armed services to obtain up to \$10,000 of life insurance at standard rates without any extra premium. Congress also enacted the Soldiers' and Sailors' Civil Relief act of 1940 which, among other things, is intended to help those entering the military forces to maintain their existing life insurance.

The Temporary National Economic committee, which was created in 1938 by the congress of the United States for the purpose of studying the problem of concentration of financial power, brought to a close in 1940 its formal hearings on life insurance and the record thereof. To supplement and correct such record, a "Statement of Life Insurance," to which 178 different life insurance companies of the United States saw fit to become signatories, was submitted to the committee and will be incorporated as a part of the permanent record of the Temporary National Economic committee.

Insurance, Marine. The year 1940 was one of the most difficult years ever experienced by marine underwriters. Commencing with the invasions of Norway and Denmark, followed almost immediately by invasions of Holland and Belgium, and then the complete collapse of France, it became increasingly difficult to know the status of the merchant marine of these countries.

Some changed officially over night from neutrals sympathetic to Great Britain to outright enemies. Eventually the merchant fleets of Norway and Holland resumed operations under arrangements with the British government. Some Danish ships were in 1940 running with permission of Great Britain, but Belgian ships disappeared from the seas. After a period of uncertainty the French merchant ships were interned.

When Italy declared war on France and England the U.S. government extended the war zone forbidden to U.S. ships and included the Mediterranean sea. This was a blow to American commerce in that area as it meant that only Greek ships remained available to handle the traffic. Lisbon, Portugal, for all practical purposes, remained the only port in Europe where U.S. ships could go. With Italy and Greece at war, the situation became more complicated, but, with the success of the British and Greeks in the eastern Mediterranean, commerce was carried on by way of the Suez canal, the Greek merchant marine operating under the direction of the British government.

Through the medium of the American Cargo War Risk Reinsurance exchange the war risk insurance requirements of all American importers and exporters were satisfactorily handled in spite of rapidly changing conditions.

In order to provide the same adequate facilities against marine risks that underwriters have provided against war risks through the War Risk exchange, a number of the largest marine companies organized the American Cargo Marine Reinsurance clearing house. It was hoped that this would develop into a reinsurance market in the U.S. that would enable all the marine companies to carry on their marine cargo business regardless of what might happen in Europe.

Marine insurance on ocean hulls ran in a normal way, the outstanding feature being the large increase in capacity which was developed in this market in response to requests from the maritime commission. The commission was desirous of having a United States market with sufficient capacity to take care of the

requirements of American shipowners without recourse to a facilities abroad, which up to the close of 1940 were a most important factor but which might be reduced or eliminated by the war in Europe. Marine underwriters were in 1940 doing their utmost to provide complete facilities for all U.S. shipowner interests as they have done for U.S. shippers.

Due to the neutrality law U.S. ships were kept away from the war zone, with the result that after 15 months of war only one U.S. ship had been lost from war perils. The "City of Rayville," a freighter belonging to the maritime commission, apparently hit a mine in Bass strait between Australia and Tasmania and became a total loss. There was no war risk insurance carried on this ship so underwriters had no war risk losses on U.S. ships.

In the U.S., the Great Lakes underwriters appeared to be having a favourable year until right up to the close of the 1940 season. On Nov. 11, the anniversary of the great storm of 1913, another storm, the worst since that time, swept across the lakes leaving death and destruction in its wake. Three large bulk freighters were known to be totally lost, one badly damaged and two others driven ashore. Two large car ferries were grounded and seriously damaged and a number of small craft suffered. Although many on the damaged vessels were rescued, the death amounted to 150.

As a result of this storm, underwriters on the lakes may show a loss for 1940.

Inland marine underwriters also suffered a heavy and unexpected loss toward the end of 1940. The Tacoma Narrows bridge across Puget sound, having a central span of 2,800 ft., had been completed and formally opened in July 1940. It was owned by the state of Washington and carried \$5,200,000 insurance. This bridge was considered one of the finest suspension bridges in the world. On the morning of Nov. 7, with a 42-mile wind blowing in from the sound, it was noticed that the roadway of the bridge was undulating badly; the heaving and writhing motion increased until finally about noon the vertical cables snapped and the roadway fell 190 ft. into the sound. The cost of rebuilding will run into millions of dollars. (S. D. McC.)

Interior Decoration. The year 1940 gave to designers in the United States their most momentous opportunity. One by one those imports, which the public had long taken for granted, became almost impossible to buy—English chintzes, French wallpapers and textiles, ornamental glass from the Low Countries, Scandinavia and Czechoslovakia, and tiques from all over the earth.

In an era of expanding construction for the only great country with money, time and talents not devoted to annihilating or attempting to preserve civilization, unprecedented strides were taken in creating, publicizing and marketing American decorative work of almost every type.

Nor were these new home-grown products a mere imitation of what Europe formerly provided. The low-cost house—small, compact, beautifully designed with an eye to style and convenience, demanding the minimum of time and money for upkeep and replacement—had at last come into its own. Not only for the vast population employed in the industrial revival demanded such accommodation, but, in addition, houses of this type became a top-flight fashion, appealing to modern-minded individuals in almost every class of society.

Such radically new settings, where every inch and every penny must count, constituted a challenge to the designer never before equalled since pioneer days. The problem of simplification and

compactness demanded by the one-room house or apartment had to be met. To design for and furnish so limited an area without inducing claustrophobia, permitting the owner to eat, sleep, work, entertain and be happy in a single multifunction room, was in 1940 an outstanding American achievement.

With space at a premium, there was no lack of colour. Patriotic themes of red, white and blue were never more popular. Great red-flowered wallpapers, too, or those in vivid plaids and stripes tended to counteract the black newspaper headlines. The use of colour for its brilliance, as well as for its wizardry in producing an illusion of greater size, received fresh impetus. Hobby rooms or "hobby corners" where space did not admit of a more extended setup—helped to rest and refresh the mind. The practicality and beauty of real leather, not only for furniture where it could be intricately worked, but also for walls, floors, lamps and an infinite variety of other decorative objects, opened an entirely new vista of creative opportunity.

With the compression of living space at home came an increased effort to render public entertaining spaces smarter, more attractive and more stimulating to the imagination. Not only was a tendency seen in the large centres, where taste has always been a step ahead, but also in the smaller cities and resorts. For, in the world apart from the western hemisphere closed to travel, Americans explored their own country as never before, and spent more money at home. Trains, planes and coastwise shipping became art-conscious as a means to increased earnings. Even hospitals realized that beauty has a therapeutic value. One wonders when the manufacturer will come to see that the same principle may easily and cheaply be applied to raising the morale and cutting the turnover in industrial plants. (D. DR.)

International Labour Organization. In 1940 the I.L.O. remained almost only "going" international convention body left in a world at war, or involved in its consequences and threats of entanglement. The League of Nations as a political organization for the time being had ceased to exist. Some of its non-political activities continued on a more restricted and less effective basis than the work of the I.L.O. which has grown in significance for social welfare in all countries. Entirely non-political, I.L.O. research, social information, statistics (on a world-wide basis) are analyzed and interpreted for use in dealing with the problems of labour and industry by the three-party real democratic method in peace or war or after-war epochs.

Added are the conclusions and recommendations garnered from the discussion participated in by the representatives of the three parties in interest—governments, employers and workers. In the International Labour conferences (mostly annual, the 26th, postponed on account of war), 67 conventions (treaties) have been adopted, binding only on member-states ratifying them. Even provide for suspension in wartime, and two more allow extensions "in the event of emergency endangering the national security."

Ratifications registered March 15, 1940 numbered 871, with 100 (Oct. 5), and perhaps others since then. The independent Committee of Experts, meeting in April, examined some 600 reports of applications of conventions. Thus a vast amount of work went on even in wartime, and the binding cement of international negotiations entered into by democratic process did not crack.

Of 49 states-members left in 1940 after the axis powers withdrew, three were absorbed by, and 13 lost their independence through the aggression of the axis powers. Yet 38 governments, including several since destroyed and all 16 American members persisted in writing their support of the principle laid down by the governing body in Feb. 1939, that the I.L.O. continue to func-

tion as completely as possible. Several members whose governments were in exile maintained active relations and some paid dues, and otherwise helped the I.L.O. to function.

So continuing with admirable fortitude and unabated zeal, the staff, depleted by the loss of more than two-thirds of its personnel, and limited in resources by the reduction of current contributions, carried on in Geneva until August when communications became too difficult. Then leaving a small remnant there, the others moved to the new Working Centre in Montreal established through the co-operation of the Canadian government and the hospitality of McGill university. Some of the staff went on special technical missions to member-states to assist in setting up systems of social insurance, and in adapting municipal legislation to I.L.O. standards; others to strengthen the London and Washington branch offices, and representation in Latin America.

Wherever located, the I.L.O. remains the greatest arsenal of fact and information concerning labour, social and economic welfare, and the essentials of social justice, whether in wartime, in preparation for the resumption of peace, or in dealing with the after-effects of war, in all countries and for all countries, belligerents or not. For evidence one need only consult the chief publications of the year, remarkable alike for the timeliness and value of the research they reveal. To cite a few: *Actuarial Technique and Financial Organization of Social Insurance* (568 pp.); *Methods of Collaboration between Public Authorities, Workers Organizations and Employers Organizations* (346 pp.); *Compensation of War Victims*; *Silicosis* (233 pp.); *The I.L.O. Year-Book, 1939-40*; *The Year-Book of Labor Statistics 1940*. The valuable services of the *Legislative Series*, the *Industrial Safety Survey*, and the *International Labor Review* (monthly) with which the weekly *Industrial and Labor Information* has been combined, are now maintained in Montreal. (See also CHILD LABOUR; LEAGUE OF NATIONS; REFUGEES.) (S. McC. L.)

International Law. The contributions of 1940 to the field of international law arose largely in relation to incidents connected with the war in progress.

Pan-American Action.—In late 1939 the countries of the American continent, inspired by the need for preserving Pan-American neutrality, had in a resolution known as the Declaration of Panama proposed to Great Britain, France and Germany that belligerent action be excluded from a zone around the Americas (except Canada) varying from 300 to 600 mi., under penalty of sanctions exerted by the American republics. In early 1940 the replies were received. The British note of Jan. 15 declined to surrender established belligerent rights, denied the power unilaterally to impose, especially with sanctions, such a new closure of the seas to belligerents, maintained that the zone might provide a sanctuary from which German vessels could attack Allied shipping while escaping capture, and that German ships might pass through the zone or engage in inter-American trade, earn foreign exchange and deprive the Allies of the fruits of their superiority at sea (*N.Y. Times*, Jan. 16, 1940). The French answer of Jan. 23 politely rejected the proposal, pointing out that acceptance would require the assurance that German warships and supply ships would not be permitted to enter the zone. It also pointed out the immunity thereby extended to German refugee merchant shipping, which the American countries would have to guarantee would not endeavour to leave port. It added that these countries would have to assume responsibility for suppressing acts of unneutral service, including radio communication, of aid to Germany. France also objected to any unilateral enforcement of the declaration (2 *Bull. Dept. of State*, 201). Germany in its answer of Feb. 14 admitted the possibility of changing international law in accordance with new conditions, but suggested that

unilateral action was not permissible and that Germany had undertaken no acts in the zone contrary to international law. The German note then alleged that the "exception" made to the Monroe Doctrine in the matter of extending territorial advantages to France and Great Britain on this continent involved discrimination against Germany, which had no territorial aspirations in the western hemisphere. The note said these advantages might be neutralized if Great Britain and France gave a guaranty not to use their American positions as bases for belligerent operations. Canada's peculiar position in this respect was pointed out. While resenting a proposed ban on the entry into the zone of German warships but not, so Germany claimed, of Allied warships, Germany expressed a willingness to discuss the question. Success, however, it suggested, depended on a revision of British and French ideas (*N.Y. Times*, Feb. 15, 1940).

Thus, all three belligerents in effect rejected the Declaration of Panama. While some attempt to patrol the zone was made by the United States, and while the proposals of the declaration were violated by belligerent captures or scuttling within the zone on several occasions (*cf.* the "Hannover," March 9, 1940, 2 *Bull. Dept. of State*, 568; the "Wakama," March 16, 1940, 2 *Bull. Dept. of State*, 306) there appeared to be no serious belief that the declaration could be enforced. It did not have the force of law. One commentator suggested that since belligerents have for a long time encroached on the rights of neutrals, the declaration is a natural response for the protection of neutrals and that new law has often been made by a widespread demand, ultimately acquiring the recognition of others (Masterson, 1940 26 *A.B.A. Jour.* 860). Perhaps the declaration may be considered as superseded by the proposals of United States house bill 1776 (Jan. 1941) which, unless amended, would admit to American harbours the warships of certain belligerents favoured by the president.

United States Protests Against British War Measures.—The department of state objected to the British demands that neutral shipping voluntarily enter British ports for contraband control on the ground that U.S. shipping was by the Neutrality act confined to inter-neutral trade and was entitled to the presumption of innocence and that U.S. shipping companies had indicated a willingness to co-operate with the British in such matters. Claims for compulsory diversion were reserved (2 *Bull. Dept. of State*, 4-5).

On Jan. 2, 1940, a note was released protesting as violative of the Eleventh Hague convention the seizure on neutral vessels on the high seas of private mails destined to the U.S. or of U.S. mails addressed to neutral countries, as well as censoring of U.S. mails on vessels forced into British ports by some form of duress (2 *Bull. Dept. of State*, 3). The British answer of Jan. 20, 1940 referred to the 1916 measures and maintained that the necessity for controlling contraband made it necessary to search the mails, an interpretation which would in effect nullify the Eleventh Hague convention (*N.Y. Times*, Jan. 21, 1940, part I, p. 26). The U.S. also protested, Jan. 22, 1940, against the long delay of U.S. ships at Gibraltar, the removal of mails and compulsory diversion of U.S. ships to the prohibited port of Marseilles.

Europe and China.—The United States notified Germany in June 1940, after the fall of France, in accordance with a resolution of the conference at Panama, that it would not recognize or acquiesce in any transfer of territory in the Americas from one to another non-American power (2 *Bull. Dept. of State*, 681). The German government in reply pointed out that recognition of the Monroe Doctrine was conditioned upon noninterference of the United States in the affairs of Europe (3 *Bull. Dept. of State*, 3). Thereupon, Secretary Hull undertook to distinguish that Doctrine from the conquests of Germany and Japan, without naming those

countries. On March 30, Secretary Hull advanced general reasons for refusing to recognize the Nanking regime set up, as claimed, by the Japanese (2 *Bull. Dept. of State*, 343). An objection to any upset in the *status quo* in French Indo-China was announced Sept. 23, 1940 (3 *Bull. Dept. of State*, 253). The department also protested against annexation of the Baltic republics by soviet Russia, July 23, 1940 (3 *Bull. Dept. of State*, 48), although Kerensky's ambassador in Washington, June 1921, had refused to admit their independence and claimed that they constituted Russia's door to the Baltic. The doctrine of non-recognition thus exemplified is sporadic and discriminatory in application, stands on no conceded principle and is actually a form of intervention. International law has not been based on the power of one or more nations to pass moral judgment upon the acts of others. A caveat of the United States against any change in the *status quo* of the Netherlands East Indies was published April 17, 1940 (2 *Bull. Dept. of State*, 411).

Exchange of British Naval Bases for United States Destroyers.—In August and September a far-reaching executive agreement was concluded for the exchange of eight British naval bases (those at Newfoundland and Bermuda were characterized as gifts) for 50 United States destroyers (3 *Bull. Dept. of State*, 199-201). The exchange was criticized widely as a violation of international law (*cf.* 34 *A.J.I.L.* 569) and its circumvention by congress and senate was also challenged. But apparently it was only the forerunner of H.R. 1776 of Jan. 1941, which was designed to grant the president the power to sell, exchange or "otherwise dispose of" any article of "defence" to any country or countries, for any purpose, and on such terms, as he saw fit, to be used against such countries as he determined. This was criticized as an unconstitutional abdication of the power to congress and the senate, and was in early 1941 under debate.

The "Altmark."—In February the German steamer "Altmark" carrying prisoners taken from British and other merchant ships by German raiders, was attacked by British warships in a Norwegian fjord, after having skirted the coast of Norway for several hundred miles in an attempt to reach a German port. It was admitted that this was a violation of the neutrality of Norway, but it was argued that the Norwegian government was at fault, since it should have prevented the "Altmark" from carrying prisoners through the territorial waters of Norway and that this justified the British self-help. The question of Norway's obligations under international law gave rise to vigorous debate, but it seems clear that Norway was not privileged or under a duty to search or take out the prisoners on board the "Altmark," which, whether a public or a private ship, would seem to have been within her legal rights in passing through Norwegian territorial waters.

Removal of Enemy Nationals from Neutral Ships.—Not unlike the situation in 1914-16, German nationals were removed from neutral ships by British war vessels on several occasions. The most important of these incidents arose between Japan and Great Britain, which removed 21 Germans from the "Asama Maru" in far eastern waters. Britain ultimately returned 12, it is believed, but kept nine on the ground that they were more than mere reservists.

Belligerent Requisition of Ships Abroad.—The power of a nation to requisition ships abroad, which arose in connection with the acts of Spanish authorities during the Spanish civil war, was again raised in more tenuous form by the purported requisition by Belgian authorities at London, undertaking to act as a government, of several Belgian but U.S.-owned vessels in U.S. harbours, some of which had in the meantime been transferred to the Panamanian and other registry. Belgian officials maintained that the vessels were to be turned over to Great Britain for war

One such libel was filed by Belgian authorities in a United States district court in Texas. Among the questions to be considered were the power of the Belgian "government" at London to requisition, the conformity of the requisition with Belgian law, the duty of a U.S. court to give effect to the Belgian orders, the actual seizure of the ship by the Belgian consul in U.S. port.

The Mexican "expropriation" of foreign-owned oil properties and Bolivian cancellation of the concession of a U.S. oil company were not settled during 1940, although diplomatic correspondence was exchanged. A proposal of the United States on April 3, 1940 to arbitrate the Mexican oil issue was rejected by Mexico on May 1. Mexico unilaterally valued the surface properties, and she proposed to pay for, at about 200,000,000 pesos. The companies insisted on a return of the properties at least to company management under a long-term operating contract and refused to surrender the subsoil rights, the recognition and maintenance of which the United States successfully insisted upon during the long correspondence with Mexico from 1917 to 1927. The issue involved important questions of international law. (See NEUTRALITY; PACIFISM.) (E. BD.)

International Trade. The foreign trade of 46 countries for the first 6 months of 1939 and 1940 is shown in Table I. The list includes 14 European, 13 American, 13 Asiatic, 4 African and 2 Oceanic countries. The countries are ranged in descending order according to the dollar value of their total trade, imports and exports combined. The total in millions of United States currency dollars has been obtained by converting the amounts in original currencies at average rates of exchange. The totals in millions of the old United States gold dollars are shown for the purpose of comparison with the data published in previous years. The aggregate value of the trade of these 46 countries from Jan. 1 to June 30, 1940 was \$15,910,717,000 currency as against \$14,040,598,000 for the corresponding period of 1939, an increase of \$1,870,119,000 or 13.3%. The value of the trade in 1940 was larger than in 1939 or 1938, but somewhat below the corresponding total for 1937 when prices were slightly higher. Of the countries listed, 19 showed an increase of \$2,083,170,000 in 1940, while the remaining 13 suffered a loss of \$213,051,000. The largest increases, in currency dollars, were recorded in the trade of the United States, \$851,000,000; Canada, \$228,000,000; United Kingdom, \$144,000,000; British Malaya, \$137,000,000; Australia, \$98,000,000; Argentina, \$82,000,000; and the Dutch East Indies, \$79,000,000. Decreases were largest in the trade of Sweden, \$1,000,000,000; Denmark, \$49,000,000; New Zealand, \$39,000,000; and Turkey, \$25,000,000.

Since June 1940 international trade as heretofore known was restricted not only by the countries of the British empire, the 21 American republics, China, Japan and a few smaller countries which preserved at least a shadow of independence. The exchange of goods between Germany and the countries of southeastern Europe was in 1940 only crude and compulsory barter. The isolation of continental Europe, with the sole exception of Spain and Portugal, both as a source of supply and a market, created a serious situation for the Latin American countries which, in 1938, had imported from continental Europe goods valued at \$516,959,000, or 34.1% of their total imports. Their goods were transferred to the great northern neighbour and United States exports to the Latin republics in the first year of the war rose to \$733,135,000 in value, an increase of 50% over 1938-39, while United States imports from the 20 South American nations reached the value of \$615,915,000, an increase of 33%. Efforts were also made to promote trade between

the republics. The ministers of finance of Argentina and Brazil signed an agreement at Rio de Janeiro on Oct. 6, 1940, to recommend measures designed to facilitate trade between the two countries and to minimize the sources of complaint. Negotiations for a similar accord with Argentina were initiated by the foreign office of Uruguay on Oct. 18, 1940. An agreement to stabilize the coffee industry was signed in Washington, D.C., on Nov. 28, 1940 by the United States and 14 coffee-producing nations of the western hemisphere, dividing on a quota basis the United States and world coffee markets among the producing states. Industrialization was to be promoted with a view to increase inter-American trade. It was reported from Chile that many factories were opening there to manufacture goods heretofore imported from Europe.

A reliable prognosis as to the course of international trade after the European and Asiatic wars is not possible. It is certain, however, that it will take years to rehabilitate the shattered economy of Europe. A hundred German experts have been reported to be working on a plan for organization of a superbank for international settlements in which all the nations of the world would settle their trade balances by some sort of a clearing system with periodical accounting. It was not known in 1940 in what way the balances would be settled at the end of a given period. The success of the plan is rather problematical, as it is to be based on the German barter system which runs counter to all principles of free exchange. It may be easy for a stronger country to force barter on a weaker country and profit by an arbitrary increase in the exchange value of its token money—as witnessed by the increase in the clearing rate of the German paper mark from 14.80 to 17.82 dinars in the trade with Yugoslavia. It is doubtful, however, whether independent nations would accept such a one-sided arrangement. The United States was able in 1940 to expand its foreign trade while carrying out an extensive program of national defence and the British were making strenuous ef-

SECRETARY OF STATE CORDELL HULL appeared before the house ways and means committee Jan. 11, 1940 to urge extension of the U.S. Reciprocal Trade Agreements act for three more years

forts to achieve a like end. If they succeed it will be easier to restore economic balance and order in the postwar world.

United States.—Table II shows exports, imports and balance of trade of the United States.

Table II.—Balance of Trade of U.S., 1929 and 1934-40
(All figures in millions of dollars)

Year	Merchandise		Excess of exports (+) or imports (-)		
	Total Exports*	General Imports	Merchandise	Gold	Silver

*Re-exports of imported merchandise are included.

The effects of the war on the business conditions in the United States were rather irregular, some unfavourable, but the foreign trade of the country was stimulated by the increased demand for American goods by the belligerents as well as by neutrals. The exports of merchandise, domestic and foreign, from the United States from Sept. 1939 to Aug. 31, 1940, were valued at \$4,016,176,000 as compared with \$2,941,073,000 for 1938-39, an increase of \$1,075,103,000, or 36.6%. Exports to all continents were higher, the largest increase, both absolute and relative, being recorded in the trade with the other countries of the western hemisphere. Exports of American goods to the countries of the British empire aggregated \$1,739,733,000 in value, representing

44.3% of the total in the first year of the war. The exports of American goods totalled \$3,927,457,000, an increase of 35.2% over 1938-39. The principal increases were in the exports of metals and metal manufactures, \$358,000,000; raw cotton, \$165,000,000; aircraft, \$157,000,000; machinery, \$115,000,000; chemicals and related products, \$86,000,000; lubricating oil, \$39,000,000; firearms and ammunition, \$39,000,000; coal, \$38,000,000; merchant vessels, \$35,000,000; paper and manufactures, \$32,000,000. The exports of aircraft went up from \$89,600,000 to \$246,300,000. The principal decreases occurred in the exports of tobacco, \$77,000,000; fruits and preparations, \$34,000,000; automobiles and parts, \$23,000,000; motor spirit, \$22,000,000; crude petroleum, \$15,000,000.

General imports totalled \$2,625,321,000 as against \$2,132,139,000 in 1938-39. Imports from Europe declined from \$623,400,000 to \$517,800,000; imports from the other continents were larger. Imports from the principal British countries rose from \$660,600,000 to \$959,800,000. Imports for consumption were valued at \$2,528,680,000 in 1939-40 as against \$2,110,711,000 in 1938-39. Increases were largest in the imports of rubber (\$265,100,000 against \$151,700,000), tin, raw silk, wool, furs, copper, sugar, newsprint, ferro-alloys, petroleum products, nickel, expressed oils and jute burlaps. There were minor decreases in the imports of chemicals, meat products, art works and machinery and vehicles.

In Sept. 1940 both imports and exports declined below the totals for August, but the value of the total trade for the first nine months of 1940, at \$4,971,485,000, was higher than in any of the years 1937, 1938 or 1939. Trade with countries of the British empire totalled \$1,481,000,000 in 1939 and \$2,297,000,000 in 1940. Trade with the principal British countries showed the following increases in exports and imports: United Kingdom, \$327,000,000 and \$16,000,000; Canada \$176,000,000 and \$68,000,000; British East Indies, \$30,000,000 and \$133,000,000; British Africa, \$22,000,000 and \$30,000,000; Oceania, \$14,000,000 and \$2,000,000. United States trade with the soviet union for the first nine months of 1940 showed an increase of 62.2% over 1939. Exports to Russia were valued at \$62,727,000 in 1940 and imports from Russia at \$16,167,000. The principal American goods exported to Russia in 1940 were metal-working machinery, \$18,219,000; other machinery, \$7,051,000; refined copper, 108,956,000 lb., valued at \$14,026,000; brass and bronze plates and sheets, 15,022,000 lb., value \$3,054,000; and 3,142,749 bu. of wheat, value \$2,634,000. The principal imports from Russia were furs and manufactures of furs, \$10,230,000 and 291,642 tons of manganese ore, \$3,732,000. United States exports to the 20 nations of Latin America increased from \$362,425,000 in 1939 to \$512,705,000 in 1940; imports from Latin America rose from \$366,201,000 to \$462,993,000. Exported goods showing the largest increases in value included iron and steel, aircraft, machinery, cotton, copper and alloys, paper, coal, wood pulp, lubricating oil, industrial chemicals and coal-tar products. Lower export values were recorded for wheat and flour, tobacco (reduced British purchases), fruits, motor spirit, crude petroleum gas and fuel oil and automobiles. Among the imported goods the highest increases in value were shown for crude rubber, tin, wool, copper, furs, manganese and chrome ores, jute burlaps, expressed oils, newsprint, gas and fuel oil and nickel. For most other articles the differences in value were small either way.

United Kingdom.—The higher average price level, rearmament activity and the general improvement in world economic conditions in 1937 resulted in an increase in British trade of more than 20% over 1936, bringing the 1937 total to the highest level since 1929. Industrial activity slackened in 1938 and foreign trade declined 10.6% below the total for 1937. The decline continued in 1939, amounting to 5.6% for the year. However, the trade values increased toward the end of the year, and the upward trend continued in 1940 when the war caused large increases in imports while successful efforts were made to maintain a steady flow of British exports. Table III shows a summary of British foreign trade.

Table III.—Foreign Trade Values in United Kingdom

Year	Total Imports (£1,000)	Exports of United Kingdom Goods (£1,000)	Exports of Imported Merchandise (£1,000)
1929	1,220,765	729,349	100,702
1934	731,414	395,986	51,243
1935	756,937	425,921	55,266
1936	847,752	440,605	60,760
1937	1,027,824	521,301	75,134
1938	919,509	470,755	61,525
1939	885,944	438,806	45,025
1939 (9 months)	655,606	336,709	38,675
1940 (9 months)	872,692	343,594	23,768

In the first nine months of 1940 the value of British trade was 20.3% higher in sterling than in the corresponding period of 1939. Imports were uniformly higher throughout the nine months, the total showing an increase of 33.1% over the previous year. The principal increases were in the imports of grain and flour, mineral oils, wool, raw cotton, vehicles, vegetable

res other than cotton and their manufactures (chiefly jute and jute goods), nonferrous metals, foodstuffs other than grain, iron and steel, ores and scrap metals and rubber. The imports of ships, aircraft and other vehicles rose from £3,337,000 to £20,017,000. Imports of the manufactures of cotton, wool, silk and rayon declined £3,500,000, while imports of other textile manufactures (jute, etc.) were £8,600,000 higher. From the very beginning of the war the authorities recognized the importance of maintaining, and, if possible, expanding the export trade to make easier the financing of the abnormal import requirements. "The promotion of the greatest volume of export trade which can be achieved under the conditions of war" was the aim of the export council established by the British government in 1914, and exporters were also assisted by the Export Credits Guarantee Department. The trade figures show the success of these efforts. Compared with 1939 the exports of British goods were higher in January, April, May and September of 1940 and lower in the other months, the total of £343,41,000 for Jan.-Sept. 1940 showing an increase of £6,885,000, or more than 2% over 1939. The exports of manufactured goods increased £17,300,000 in value, though the exports of machinery and vehicles had declined £5,100,000. This loss was outweighed by the increases in the exports of textiles, chemicals and related products, paper and cardboard, pottery and glass, electrical apparatus, hardware and cutlery. Exports of textile manufactures, not including apparel, rose from £69,100,000 to £81,900,000; exports of chemicals, drugs and dyes from £17,000,000 to £23,200,000. The increase in the exports of manufactures was high enough to overcome the decline of £9,300,000 in the exportation of raw materials, one-half of the loss being due to smaller exports of coal. A large increase in the exports of beverages was balanced by a corresponding decline in the value of foodstuffs exported.

For the first 14 months of the war, Sept. 1, 1939-Oct. 31, 1940, imports valued £1,240,100,000; exports of British goods, £493,300,000; re-exports, £1,370,000. Corresponding figures for 1938-39 were: Imports, £1,021,000,000; British exports £525,400,000; re-exports, £59,900,000. The values for the trade for Oct. 1940 were £85,100,000, £23,400,000 and £970,000, as compared with £61,900,000, £24,600,000 and £2,000,000, respectively, for Oct. 1939.

Germany.—Foreign trade values for old and new Germany are summarized in Table IV.

Table IV.—Foreign Trade Values in Germany

Year	Imports (Rm. 1,000,000)	Exports (Rm. 1,000,000)	Excess of imports (—) or exports (+) (Rm. 1,000,000)
1929	13,446.8	13,382.7	+ 35.9
1933	4,203.6	4,871.4	+667.8
1934	4,451.0	4,166.0	—284.1
1935	4,158.7	4,260.7	+111.0
1936	4,217.9	4,786.2	+550.3
1937	5,468.4	5,911.0	+442.6
1938	5,449.3	5,256.9	—192.4
Greater Germany**			
1938	6,051.7	5,619.1	—432.6
1938 (7 months)	3,456.8	3,282.3	—174.5
1939 (7 months)	3,194.3	3,314.5	+120.2

Trade of Germany and Austria, combined, with other countries. Beginning with Oct. 8, the trade of the Sudeten districts is also included, and since April 1, 1939, also the trade of Memel. The trade of Bohemia and Moravia is not included.

No official reports on the foreign trade of Germany have been issued since July 1939. It is certain, however, that both the volume and the value of the trade declined in 1940. For a number of years German economy had been based on preparation for war. Many of the war materials had to be obtained abroad and foreign exchange reserved for such purchases reduced the means available for the acquisition of foodstuffs and materials needed by the peace industries. Thus the growing armament expenditures naturally lowered the standard of living of the civilian population which received guns instead of butter. When onions disappeared from the market, the authorities blamed "an international Jewish hoarding plot." Trade with eastern countries was largely cut off by the blockade, while the trade with southeastern Europe was continued in the form of a forced barter, with a stronger partner dictating the terms. Even this trade declined in later months, as it became more and more difficult for the harassed industries of Germany to make deliveries on time. Before the blockade it was possible

Table V.—French Foreign Trade
(All figures in millions)

Year	Imports		Exports	
	Francs	Dollars	Francs	Dollars
1929	58,221	2,282	50,130	1,965
1933	28,431	1,114	18,474	724
1934	23,097	905	17,850	700
1935	20,974	822	15,402	607
1936	25,414	808	15,402	548
1937	42,391	1,005	23,938	566
1938	45,981	788	39,586	520
1938 (8 months)	30,402	539	18,706	331
1939 (8 months)	32,530	508	23,832	372

Germany, as its stocks of exportable goods dwindled, to keep its export engagements by re-exporting to one client goods obtained from another, thus actively competing with the latter. In 1939, for example, more than one-tenth of the merchandise received by Bulgaria from Germany was of foreign origin, including 8,816 metric tons of cotton, 1,147 tons of wool, 1,991 tons of mineral oils, 559 tons of rubber, 563 tons of cacao beans, 5 tons of coffee, and other goods. Such re-exportation became impossible in 1940 when the blockade stopped importation from overseas countries. At the same time exports to overseas were limited to a few air-mail shipments

INDEXES OF CHANGES in quantity and unit value (price) of total exports of United States merchandise and imports for consumption, by quarters—1935-40. Prepared in the Bureau of Foreign and Domestic Commerce

and deliveries by ships navigating little-used sea lanes. The trade of the United States, Argentina, Brazil, Chile, China, Philippines, Turkey and Egypt with Germany for the first 6 months of 1940 had a value of only \$31,827,000, as against \$283,103,000 for the corresponding period of 1939, a decline of 88.8% or more than seven-eighths. This loss could not be made good by the trade with southeastern Europe. The trade of Hungary with Germany for the first half of 1940 was valued at \$82,869,000, an increase of only \$10,922,000 over 1939. Rumanian trade with Germany had a value of \$74,670,000 in 1940, an increase of \$17,740,000. The chief Rumanian exports to Germany were 265,991 metric tons of mineral oils, 359,980 tons of grain and flour and 19,182 tons of animals and foodstuffs of animal origin. Imports from Germany had a higher value than exports to Germany in the case of both countries in the first half of 1940.

France.—Table V shows the value of French foreign trade (the depreciation of the franc has made it advisable to show statistics both in actual currency values and in gold dollars).

The unsettlement of internal financial, social and general economic conditions in France affected the foreign trade to an unusual degree. The conditions improved toward the end of 1938 and the improvement continued during the first six months of 1939 when the imports and exports averaged 4,192,000,000 and 3,007,000,000 francs a month. There was a recession in July and Aug. 1939 when the monthly averages declined to 3,887,000,000 and 2,896,000,000 francs respectively. The war resulted in a serious dislocation of French trade which cannot be shown in figures, however, as no reports on French trade have been issued since the outbreak of the war. In peace times France had done most of its trade, apart from the colonies, with the United States, the United Kingdom and three of its neighbours: Belgium, Germany and Switzerland. In 1937 these five countries supplied 34% of French imports and received 43% of French exports. The German market was cut off by the war; in some other markets France suffered from the increasing poverty of its clients, as most of French exports are quality goods and the United States became the chief supplier of the country. In the first six months of 1940 United States exports to France had a value of \$252,395,000 as compared with \$70,385,000 in 1939, while United States imports from France declined slightly from \$33,000,000 to \$30,000,000. In the same two half-yearly periods the trade of Argentina, Egypt, Turkey, Brazil and the Philippines with France increased, while the trade of Chile and China with France declined slightly, the total for the seven countries named increasing from \$64,802,000 in 1939 to \$84,235,000 in 1940. United States exports to France for the first year of the war had a value of \$327,200,000 as against \$156,100,000 for 1938-39 and imports from France were \$50,900,000 as compared with \$66,000,000 for 1938-39. In the three months, July to Sept. 1940, United States trade with France dwindled to \$401,000 of exports and \$2,673,000 of imports. The German invasion had devastated northern France where whole towns were destroyed and the so-called "requisitions" by the invaders caused widespread poverty and misery among the population. Transportation was demoralized by lack of fuel and lack of organization and the movement of merchandise both in domestic and foreign trade became increasingly difficult. The French port of Marseilles saw its once large trade reduced to traffic with French North Africa, and even this trade

was threatened by the shortage of fuel oil. In Aug. 1940 Marseilles was able to import only 116,000 tons and export 63,000 tons, just about one-fourth of the quantities handled in Aug. 1934.

Other Countries.—The foreign trade of Japan for the first six months of 1940 showed an increase of 21.9% in paper yen over the corresponding period of 1939. Trade with the European countries declined from 278,000,000 to 205,000,000 yen, while the trade with the other continents increased. It was doubtless due to the exigencies of war that Japanese exports to Manchoukuo, Kwantung and China rose from 725,000,000 to 1,014,000,000 yen, representing 54.5% of total exports as against less than 50% in 1939. The exports of cotton piece goods declined from 1,116,000,000 to 915,000,000 sq.yd., and large quantities were reported stored on godowns in the principal ports at the end of 1940. The exports of raw silk decreased from 21,372,000 to 14,731,000 lb. but the value rose from 167,000,000 to 193,000,000 yen. Imports of rice and wheat, coal, phosphates and metals were higher in value. Imports of raw cotton declined from 643,207,000 to 540,068,000 lb., the value rising from 218,000,000 to 266,000,000 yen.

In the trade of India imports for the first six months of 1940 were valued at Rs. 920,000,000 and total exports at Rs. 1,242,000,000, as against Rs. 857,000,000 and Rs. 868,000,000, respectively, in 1939. Nearly two-thirds of the increase in the value of exports was due to the larger sales of jute and jute products (great demand for sandbags in Great Britain). The exports of raw jute increased Rs. 51,000,000 in value; gunny cloth, Rs. 88,000,000 and gunny bags, Rs. 105,000,000. Exports of tea rose from Rs. 56,000,000 to Rs. 78,000,000, and exports of tanned or dressed hides and skins from Rs. 28,000,000 to Rs. 50,000,000.

The foreign trade of Argentina showed smaller quantities and higher values in 1940 for both imports and exports. Coal, wood and iron accounted for the quantity decline in imports; maize, linseed and forest products in exports. The trade lost by the closing of European markets represented about 40% of Argentine exports and a slightly higher percentage of imports. The exports of linseed declined from 756,279 to 613,676 metric tons and the exports of maize from 1,671,218 to 1,364,788 tons, the price declining from 62.75 to 48.86 pesos a ton. A part of the large surplus of maize was sold for fuel. Argentine exports to Germany in 1940 declined 67,800,000 pesos, while the exports to Italy and Spain increased 51,405,000 pesos, a part of that increase probably going to Germany.

Chilean exports of copper increased from 1,464 to 2,061 quintals in quantity and from 138,700,000 to 231,000,000 pesos in value.

Exports of sugar and tobacco from the Philippines were much smaller in 1940.

Egypt imported only 15,766 gas masks in 1940 as against 173,007 in 1939. The exports of Egyptian cotton decreased from 206,733 to 175,632 metric tons, the value rising from £E.11,676,000 to £E.14,233,000.

France, Germany, Italy and the soviet union have not issued any trade reports for 1940. (See also TRADE AGREEMENTS.) (J. J. K.)

Interstate Commerce Commission: see GOVERNMENT DEPARTMENTS AND BUREAUS.

Intoxication, Alcoholic. In the treatment of acute alcoholism the administration of fructose and glucose enhances the disappearance of alcohol from the blood, whereas galactose delays it. The ingestion of food appears to have a specific effect upon the metabolism of alcohol, but diminishes its absorption rate. Fats have the greatest influence in diminishing the absorption rate.

A preponderance of evidence indicates that muscular work does not greatly affect the rate of disappearance of alcohol from the blood. Insulin produces some increase in the rate of its absorption, but it is more effective when combined with glucose. Its disappearance is unmodified by caffeine or atropine; adrenalin appears to interfere with the absorption rate; thyroxin with its oxidation; but pituitrin reduces the alcohol level in the blood. Some authors are impressed with the effectiveness of benzedrine in the treatment of acute alcoholism.

British literature witnessed the appearance of a new *Quarterly Journal of Studies on Alcohol*. It was published in the United States. The first two issues of Volume I contain numerous articles wherein special phases of the problem of alcoholism are reviewed. These articles serve as a fundamental base line for evaluating the present status of knowledge on different aspects of the problem.

The medical literature of the year, as in previous years, was still concerned with the concept that chronic alcoholism is a medical problem. Nevertheless, social sanction for the consumption of alcoholic beverages is a potent factor in the production of alcoholism. The solution of the problem rests, not upon medical knowledge alone, but upon a large and diversified body of

information with which the promotion of human welfare is concerned. Of great significance in this direction was the enactment of legislative control measures wherein the sale and distribution of alcohol, with its present moral, profit and revenue motivation, would no longer obscure its medical, sociological and economic significance. There was, as in previous years, a trend in medical literature to regard the problem of the habitual drunkard as representing a distortion in personality function.

Even in those alcoholic mental disorders, long considered as due to conditions that interfere with brain cell nutrition, such as for example as delirium tremens, the role of individual constitutional psychogenic factors in relation to habitual drunkenness is being given greater value.

The role of vitamin deficiency in chronic alcoholism continued to command attention, with the consensus that it is an important factor in the production of disabilities seen among chronic drinkers. A diet with high caloric values, supplemented by vitamins, is a recognized principle of treatment.

Further interest was shown in the possibility of counter-conditioning chronic alcoholic patients through the substitution of either a conditioned reflex of nausea and disgust for alcohol or other substitute conditionings having greater emotional significance.

The state legislature of California authorized the establishment of a tax-supported inebriate colony for the segregation and treatment of alcoholics and contemplated its development in 1941.

Inventions: see PATENTS.

Iowa, north-central state of the United States, popularly known as the "Hawkeye state"; area 56,147 sq.m. population (U.S. census, 1940) 2,538,268. Capital, Des Moines, 159,819 (the only city in Iowa with a population over 100,000). Of the state's population in 1940, 1,084,231 or 42.7% were classified by the federal census as urban. By Jan. 10, 1941, 24,005 aliens had registered in Iowa under the alien registration act.

History.—The officers elected on Nov. 5, 1940, who took office in Jan. 1941, were: governor, George A. Wilson (re-elected); lieutenant gov., B. B. Hickenlooper; auditor, C. B. Akers; treasurer, W. G. C. Bagley; secretary of state, Earl G. Miller; secretary of agriculture, Mark G. Thornburg; attorney general, John M. Rankin; and superintendent of public instruction, Jessie M. Parker. All are Republicans. In the presidential election Wilkie received 632,370 votes and Roosevelt, 578,800. A state conservation commission, a state board of social welfare, a state commerce commission and an Iowa unemployment compensation commission are also a part of the state administration. Members of the commerce commission are elected by popular vote. Members of other boards are appointed by the governor. The nine members of the state supreme court are elected for terms of six years. The state highway commission is located at Ames, Ia.; and

other boards and commissions have their headquarters at Des Moines. Funds for the state are provided by taxes on property, incomes, retail sales, corporations, gasoline (state tax three cents per gal.) and inheritances. There are limited exemptions on home-lands. By July 1, 1940, 5,208.2 mi. of primary roads of Iowa were paved and 3,263.4 mi. were gravelled or otherwise surfaced. The secondary road system, 38,848 mi. were gravelled by Jan. 1, 1940 and 42 mi. were paved.

Education.—The superintendent of public instruction reported for the school year, 1938–39, 8,795 rural schools in Iowa, 1,447 graded schools and 950 approved high schools. The total number of children of school age (5–21 years) was 681,297. Of these 9,200 were enrolled in the public schools and 2,126 in public junior colleges. The teachers in the public schools, exclusive of junior colleges, numbered 26,051 and the cost of the public schools was \$52,629,116.24, three-fourths of which was raised by the general property tax in local districts. Iowa ranks first among the states in literacy with only .8 of 1% illiterate.

Charities.—A state board of social welfare, composed of three members appointed by the governor (King R. Palmer, chairman), administers old age assistance, aid to the blind, aid to dependent children, child welfare and emergency relief. Working with the local boards in the 99 counties. For the year 1939–40 the state appropriated \$7,000,000 for old age pensions. The board of control (D. R. McCreery, chairman) has charge of the state's penal, correctional and eleemosynary institutions. Statistics for these as of Dec. 31, 1940, were as follows: men's reformatory, Potosi, 1,118; state penitentiary, Fort Madison, 1,390; women's reformatory, Rockwell City, 66; training school for boys, Eldora, 12; training school for girls, Mitchellville, 167; state juvenile home, Toledo, 221; soldiers' home, Marshalltown, 481; and soldiers' orphans' home, Davenport, 438. The four state hospitals for the insane had 6,450 inmates and the institutions for the feeble-minded and epileptics had 3,283.

Banking and Business.—There were 106 national banks, 299 savings banks, 245 state banks and 1 trust company doing business in Iowa in 1940. On Dec. 31, 1940, the 545 state institutions had total deposits of \$465,328,868.62, an increase of \$64,005,507.8 over those of June 30, 1939. On June 30, 1940 the deposits in the national banks totalled \$250,253,000. Approximately 90% of the deposits in state banks and 56% of those in national banks were protected by government insurance. Prices of farm products through Oct. 1940 decreased 1.8% from those for the same period of 1939, but farm income increased 10.4%.

Electric power production for the first ten months of 1940 showed an increase of 2.2% over that for the same period of 1939 and new automobile sales increased 10.8%. Building contracts of all kinds for Jan.–Nov. 1940 increased 8.4%, residence building contracts, 32.9%, business building contracts, 81.4%, department store sales, 3.4%, employment, 5.6%, industrial pay rolls, 5.1% and bank debits, 6.5%. Public building contracts decreased 9.1%.

Agriculture.—There were 210,343 farms in Iowa in 1940 with 1,249,055 ac. of land. About 56.5% of this land was farmed by tenants. Crops in Iowa were generally good in 1940. The figures in the table indicate the production and value of the principal crops for 1940 as reported at the close of October. The use of hybrid seed corn and better farming methods increased the average yield of corn from 35.5 bu. per ac. for 1928–37 to 52 bu. per ac. in 1939.

On Jan. 1, 1940 there were 9,651,000 hogs on Iowa farms, 344,000 sheep, 4,688,000 cattle, 752,000 horses and 54,000 mules. The total cash income of Iowa farmers for Jan.–Oct., 1940 was \$64,206,000, as compared with \$659,359,000 for the year 1939. The income for the first ten months of 1940, \$416,039,000 came from livestock, \$119,430,000 from crops and \$28,737,000

Production and Value of the Principal Crops in Iowa in 1940

Crop	Acres	Production	Value
Corn	9,031,000	460,581,000 bu.	\$267,137,000
Oats	5,166,000	206,640,000 bu.	55,793,000
Hay (all tame)	4,381,000	6,572,000 tons	39,432,000
Hay, wild	137,000	151,000 tons	785,000
Wheat	341,000	8,121,000 bu.	5,441,000
Barley	462,000	14,553,000 bu.	5,539,000
Rye	40,000	749,000 bu.	260,000
Potatoes	60,000	6,120,000 bu.	4,284,000
Soybeans (beans)	733,000	15,026,000 bu.	10,518,000
Soybeans (hay)	764,000	1,140,000 tons	*

*Soybean hay is included in All Tame Hay above.

from government payments. On Jan. 1, 1940, there were 18,840 auto trucks, 117,833 tractors and 20,029 mechanical corn pickers on Iowa farms. Some 50,500 farm homes were reported as electrified in June 1939.

(R. A. GA.)

Iowa, State University of. First state university to admit women on equal standing with men. It is in Iowa City, a community of 17,000 persons, 55 mi. west of the Mississippi river. Iowa's first general assembly established the university Feb. 25, 1847.

Enrolment in 1940 for the fifth time passed the 10,000-mark, although the figure of 10,685 for the 12 months ending in June 1940 was short of the record established three years before. A record total of campus students, 6,888, enrolled for the first semester of 1940–41. Degree awards totalled 1,716, including 645 advanced degrees.

When the \$90,000 radio transmitter and studios were dedicated, it was announced that WSUI led all educational stations in air time per week. Nuclear physics research was aided by construction of a \$25,000 atom-smasher, and a \$25,000 wing to East hall to house the journalism school was started.

Gifts and grants in 1940 totalled \$73,120, bringing the five-year total to over \$1,600,000. In the nine colleges and five schools, a staff of 638 persons gave instruction.

Iowa State College. Iowa's land-grant institution at Ames during 1940 made marked progress in a number of its facilities for research and instruction in agriculture, engineering, home economics, science and veterinary medicine. Two new buildings were completed during the year. A gymnasium for women, constructed at a cost of \$250,000, provides the college's first adequate facilities for physical education for women. The other, the Collegiate Press building, houses a printing plant and offices and workrooms of five student publications. It is unique in that its construction cost was financed entirely from the earned reserve funds of those student journalistic activities. Some 200 ac. of land were added to the college recreation area to provide facilities for winter sports. A grant from the Rockefeller foundation made possible the study of two basic problems of genetic research. One of these is the discovery of the basis of hybrid vigour. In the year ending in June 1940, resident enrolment in Iowa State college reached a new high of 7,969 students, including 2,798 women and 1,108 graduate students.

(R. W. BE.)

Iran, known before March 1935 as Persia, a country of western Asia bounded to the east by India and Afghanistan, to the north by the U.S.S.R., to the west by Iraq and Turkey, and to the southwest and south by the Persian gulf and Arabian sea; ruled since 1926 as a constitutional kingdom by Reza Pahlavi Shah (b. 1878); premier, A. Martine Daftori (Oct. 31, 1939). Area, 634,360 sq.mi.; pop. (est.), 15,000,000. Chief towns: Teheran (cap., 360,000), Tabriz (220,000), Meshed (140,000), Shiraz (120,000), Isfahan (100,000). Language, Persian; religion, Mohammedan.

History.—Throughout 1940 Iran maintained her resolve to keep out of the war, but at the same time to defend herself if attacked. For the greater part of the year she envisaged only one possible invader, namely, Russia, and she did her utmost to prevent any friction with her great northern neighbour. As a signatory to the Saadabad pact of 1937—the other members being Turkey, Iraq and Afghanistan—she kept a vigilant eye on any deterioration of the middle east position. Officially neutral, Iran denied repeatedly that Teheran was being made the focus of axis intrigue in the middle east. That allegation, however, continued to find credence in various quarters. (K. Wt.)

Banking and Finance.—Revenue, ordinary (est. 1938–39), 1,528,400,000 rials; (est. 1939–40) 1,930,096,000 rials; expenditure, ordinary (est. 1938–39), 1,527,500,000 rials; (est. 1939–40) 2,613,482,000 rials; foreign loan (May 15, 1939), £991,120; public debt (Dec. 31, 1938), 98,900,000 rials; note circulation (May 31, 1939), 856,000,000 rials; gold reserve (May 22, 1939), 310,949,000 rials; exchange rate rials, 80.50=£1 sterling.

Trade and Communication.—Foreign trade (merchandise) 1937–38: imports, 1,394,878,000 rials; exports, 2,559,881,000 rials. Communications 1938: roads fit for wheeled traffic, *c.* 8,700 mi.; railways open to traffic, 1,072 mi.

Agriculture and Minerals.—Production, 1936–37 (in metric tons): petroleum, crude (1938), 10,359,000; wheat, 2,159,560; barley, 882,564; rice, 398,510; beetroot, 135,940; cotton, 122,480; wool, 12,963; beet sugar (1937–38), 26,100; tobacco (1937–38), 15,900.

Iraq, an Arab state of the near east, between Iran, Syria and Arabia, watered by the Tigris and Euphrates; an independent kingdom since 1932, when the British mandate was terminated. Area, 116,000 sq.mi.; pop. (est. Dec. 31, 1938), 5,000,000. Chief towns: Baghdad (capital, 400,000), Mosul (260,000), Basrah (180,000). Ruler: King Feisal II; regent: Prince Abdul-Ilah; premier: Sazid Rashid el Gailani; language: Arabic; religion: Mohammedan.

History.—Of all the independent middle eastern countries, in 1940 Iraq showed, superficially, the least stability. The youthfulness of her king, Feisal II; the apparent insecurity of her government; anxiety over the development of Palestine; preoccupation over the fate of Syria; the menace to her ally, Britain, to Turkey and to Egypt; the restriction of her oil output and the consequent drop in her royalties—all these things had a profoundly disturbing effect. But the Iraqis not only held fast to their international loyalties but also contrived to maintain a precarious continuity of administration. To the propaganda of Berlin and Rome they gave little hospitality.

With so new a nation as Iraq, domestic considerations naturally were apt to overweigh international matters. This fact showed itself in the much-increased interest in the possibility of reaching union with other Arabs. With the collapse of France and the subsequent uncertainty of Syria's future, the Iraqis became more than ever concerned with the fate of their brothers under French mandate. They, like the Turks, were determined that, whatever happened to Syria, it should not fall under new alien dominion—many of them would fain have had it incorporated in Iraq.

Of Iraq's foreign policy it may be said to have closely resembled that of Turkey. (K. Wt.)

Education.—In 1938: elementary schools, government, 741; scholars, 94,368; new schools opened 1938–39, 22; secondary schools, 14; scholars, 1,904; intermediate schools, 48; scholars, 10,611.

Banking and Finance.—Revenue, ordinary (actual 1938–39), 5,686,050 dinars; (est. 1939–40) 6,033,000 dinars; expenditure, ordinary (actual 1938–39), 5,493,265 dinars; (est. 1939–40)

5,994,632 dinars; public debt (Dec. 31, 1938), 1,000,000 dinars; notes in circulation (June 30, 1939), 4,200,000 dinars; foreign assets reserves, £4,600,000 sterling; exchange rate (current based on sterling): 1 dinar=£1 sterling.

Trade and Communication.—Foreign trade 1938 (merchandise): imports, 9,361,004 dinars; exports, domestic, 3,472,369 dinars; foreign produce, 216,466 dinars. Communications 1939: roads, main routes, 3,130 mi.; railways, open to traffic, 752 mi.

Agriculture and Minerals.—Production 1938 (in metric tons): petroleum, crude, 4,272,000; wheat, 600,000; rice, 360,000; barley (1937), 570,000; tobacco, 4,000; wool (1937), 7,200; cotton, 2,900.

Ireland: *see* EIRE.

Ireland, Northern. Northern Ireland comprises the six Ulster counties of Antrim, Armagh, Down, Fermanagh, Londonderry and Tyrone, forms part of the United Kingdom of Great Britain, but (since 1920) has its own parliament and executive, though also represented in the imperial parliament by 13 members. Ruler and national flag, as for Great Britain. Governor: the duke of Abercorn; premier: Rt. Hon. Viscount Craigavon, till Nov. 24, 1940; John Miller Andrews, thereafter.

Area and Population.—Area, 5,238 sq.mi.; pop. (June 3, 1938), 1,285,000. Chief towns (pop. census 1937): Belfast (cap., 438,086), Londonderry (47,813). Language: English; religion: Christian (Roman Catholic, 33.75%; Presbyterian, 31.4%; Episcopalian, 27%).

History.—War conditions necessitated the introduction during 1940 of supplementary budgets. The budget introduced on Aug. 6 made provision for a contribution of £6,000,000 to the imperial exchequer, compared with a peacetime figure of £2,000,000.

At the end of September the war savings campaign, inaugurated in Nov. 1939, had raised £3,169,000—£1,825,000 representing Ulster savings certificates (national defence issue) and £1,344,000 defence bonds.

Agricultural production was substantially increased. The tilage campaign, powerfully stimulated by the ministry of agriculture, resulted in the plowing-up of 262,000 ac. of old grassland. The flax acreage was increased from 21,000 to 46,500, the barley acreage from 2,000 to 17,000 and the wheat acreage from 3,000 to 11,000. The 1941 program provided for an additional 200,000 ac. under crops and the increase of the flax acreage to 100,000.

Many of Northern Ireland's industrial establishments were engaged on large contracts for war supplies. The linen industry was seriously affected by the shortage of flax and the consequential restrictions on consumption in the home market. Supplies of flax for general export purposes and for meeting the special requirements of the U.S.A. market were placed at the disposal of the industry. Linen exports were therefore increased in value and thus helped materially in the vital task of maintaining and increasing foreign credits. Other valuable items of export were machinery, whisky, ropes, twine and cordage. (*See* LINEN AND FLAX.)

An investigation was being conducted into Northern Ireland's resources of bauxite and iron ore. The indications were encouraging. Social services were fully maintained. The Old Age and Widows' Pensions bill provided for supplementary pensions based on household needs and also improved the position of insured women in respect of their age qualification.

The newly-formed ministry of public security had control of civil defence, including the organization of air-raid precautions and the administration of the regular and special constabulary and the local defence volunteers. In local government a policy

retrenchment enforced by war conditions necessitated the suspension of nonurgent schemes. Local authorities were liberally assisted by state grants in A.R.P. services. (R. D. B.)

Viscount Craigavon's death on Nov. 24 was mourned throughout the British isles. He was succeeded as premier on Nov. 25 by John Miller Andrews, the minister of finance.

Education.—In 1938: elementary schools, 1,700; scholars, 191,122; secondary schools, 76; scholars, 14,557; universities, students, 1,590.

Banking and Finance.—Revenue (1939-40), £18,204,542; st. 1940-41 £20,006,000; expenditure (1939-40), £16,084,924; st. 1940-41 £16,266,000.

Trade and Communication.—External trade 1938: imports, 4,385,000; exports, £51,061,000. Communications 1939: roads for motor traffic, 13,043 mi.; railways, standard gauge, 741 mi.; narrow, 121 mi.; canals, 180 mi.

Agriculture and Manufactures.—Production 1938 (in tons): potatoes, 491,000; oats, 22,700; wheat, 3,850; flax, 4,036; barley, 1,025. Livestock (1939): cattle, 700,564 head; sheep, 551,122 head; pigs, 565,726 head; poultry, number, 6,038,000. Shipping, tonnage launched (1938), 79,468; value of linen goods exported 1938, £5,480,000.

Iron and Steel. Discussion of the iron and steel industry can for the most part be handled more satisfactorily subdivided into its three main headings—iron ore, pig iron and steel. Production tables under each of these headings include all countries in which production of the commodity in question has materially exceeded 1,000,000 tons, giving a coverage which in general accounts for 93-98% of the world totals. Production data having been suppressed since Sept. 1939 for most countries outside of the United States, such later figures as are presented are largely estimates.

Iron Ore.—Statistics on world iron ore output were so fragmentary after 1938 that it is useless to attempt to estimate the totals, but it may be assumed that these followed the same general trend as with pig iron, for which increases over the preceding year were 24% in 1939 and 4% in 1940. United States output increased by 43% in 1940, to 73,800,000 tons; and shipments rose 37%, to 75,000,000 tons. The bulk of the increases was from the Lake Superior district, as other areas increased only 1% in output and 20% in shipments.

The most important feature of the world industry was the extent to which the war changed the normal distribution of iron ore supplies in Europe, of which more will be said in the discussion of steel.

Pig Iron.—World production of pig iron increased by 24% in 1939 and by 4% in 1940. Most of the countries actively involved in the war showed declines in output, but these were more than offset by an increase of 33% in the United States. The only country to make a new record high in 1940 was the soviet union;

STEEL PRODUCTION in the United States: percentage of capacity

SHIPMENT OF IRON ORE from Kiruna, Sweden, to Narvik, Norway, and thence to Germany by sea was interrupted by the Norwegian war in 1940. Thereafter the victorious Germans worked rapidly to restore this vital supply line

the world total also made a new record, at 104,000,000 tons.

Steel.—World steel production rose by 26% in 1939 and by 16% in 1940, to a new record high at 159,800,000 tons; the outputs of the United States and the soviet union were also new records. On the whole, the belligerent countries maintained their steel outputs better than that of pig iron, but practically all had small declines, leaving the United States chiefly responsible for the increased world total.

War and Steel.—As soon as it became inevitable that war would develop in Europe, it became equally inevitable that there would be a complete rearrangement of the normal distribution system for the raw materials required in the production of steel, primarily iron ore, for both Britain and Germany were dependent on outside sources, the former for one-third and the latter for two-thirds of the normal supply. At the outset, Britain, with France as an active ally, was in the more favourable position, for while importation from the more remote sources of supply (Newfoundland, Tunisia and Algeria) was hampered by transpor-

tation difficulties, France, Sweden and Norway were still accessible. On the other hand, Germany lost ready access to three-quarters of her imports and half of her total supply of iron ore, for not only was France entirely closed to her, but the even more important Swedish supply was hard to secure, as during the winter months shipment could be made only through Norway and the North sea, the inside route through the Gulf of Bothnia being closed by ice. But as the war progressed, the conditions were gradually reversed by the occupation of Poland, Belgium, Luxembourg and Norway, the economic domination of Sweden and finally the fall of France. At the end of 1940 Germany was in command of sufficient sources of supply to cover her needs for ore, while Britain was deprived of access to all of the neighbouring sources and was forced to rely on the remote sources and imports of steel from the United States. By successive occupation of the various areas, Germany secured control of a total steel making capacity just about equal to that of her own prewar area; in other words, her potential steel supply was approximately doubled and there were ore supplies available to make it effective, though of course it is questionable to what extent production could be maintained in the occupied areas, where operation would to a considerable extent be with what amounted to forced labour. On the opposing side, the production capacity of Poland was soon lost and that of France followed later, leaving only the British output, and that handicapped by the remoteness of the available sources of ore supply needed to make up the deficit in the domestic output. It was this condition of affairs that so tremendously increased the demand for United States steel to supplement the

British supply from domestic sources, and the necessity that it be supplied promptly and liberally, for the importation of one ton of steel saves the importation of two tons of ore, and at the same time relieves the domestic smelting industry of some of its overload. (See also STRATEGIC MINERAL SUPPLIES.)

As a result of this emergency demand, exports of pig iron, scrap and steel from the United States to Britain during 1940 were in excess of 3,500,000 tons, over 70% of which was in the second half of the year, and in 1941 this amount might be expected to double. On top of the British demand, there was additional home demand for the defence program and this in 1941 was expected to reach about the same figure as the British demand. Together these amounted to about one-quarter of the 1940 output, indicating a possible demand in 1941 that might be of the order of 70,000,000 to 75,000,000 tons, which, incidentally, is just about the rate at which production was being turned out at the end of 1940. This being the case, there seemed in 1940 to be no need to fear that the steel industry of the United States would not be able to meet the double load that was being placed upon it without detriment to the regular domestic consumption, especially since production capacity had already risen from 62,500,000 tons at the end of 1939 to 70,000,000 tons in Nov. 1940, according to official reports from the industry, while an unofficial estimate made in Jan. 1941 placed the capacity at 76,000,000 tons, with more additions still under way. Irrigation. At the close of the rainfall season of 1940, the federal irrigation water supply forecasts predicted a subnormal irrigation water supply for all the irrigated areas of the United States except the northern and central sections of California. This prediction was generally borne out, but because of these early season forecasts farmers were guided in planning early or late maturing crops as conditions warranted, with the result that there were no widespread crop failures and relatively few crop shortages due to insufficient irrigation supply. Federal irrigation projects on which relief funds could be expended continued to be the most active of the irrigation enterprises, although some of these funds were also expended for water-conservation works on semipublic irrigation districts.

During 1940 federal irrigation projects constructed by the bureau of reclamation were prepared to serve more than 106,000 ac. of land not previously served. More than 23,000 ac. were opened for settlement, providing new homes for approximately 261 farm families dislocated by drought or other misfortunes. Under the construction program of the bureau, water will be provided for about 2,500,000 additional acres of new land and about 3,500,000 ac. now insufficiently irrigated, to support another million people.

During the year work was in progress on 27 federal irrigation projects in 13 states. The Roza diversion dam on the Yakima river in Washington; the Seminoe and Grassy Lake storage dams in Wyoming; the Boca storage dam in California and the Fresno dam in Montana were completed. At the close of the year there were being constructed the Grand Coulee dam on the Columbia basin project, Washington; the Shasta and Friant dams on the Central valley project, Calif.; Marshall Ford dam, Colorado river project, Tex.; Green Mountain dam, Colorado-Big Thompson project, Colo.; Deer Creek dam, Provo river project, Utah; Wickiup dam, Deschutes project, Ore.; and the Crane Prairie dam, Deschutes project, Ore. The Friant and Crane Prairie dams were begun during the year. Grand Coulee dam, when completed

will be the largest concrete dam in the world, while Shasta will be second, Friant fourth and Marshall Ford fifth. On July 1, 1940, storage reservoirs of the bureau of reclamation had a combined capacity of 51,215,000 ac. ft.

All-American Canal.—This canal, constructed by the bureau of reclamation for the Imperial irrigation district (Calif.), commenced delivery of water in Oct. 1940, but the canal will not be in full operation until 1942. The main canal to serve the Imperial valley is 80 mi. long with capacities ranging from 15,155 to 17,755 sec. ft. Its construction included the excavation of approximately 65,000,000 cu.yd. of material and building of the Imperial dam and desilting works. At about mile 40 on the main canal, a branch canal some 135 mi. in length is under construction to serve the Coachella valley of Riverside county, Calif. It will be several years before this unit is completed.

Under full development the All-American canal will be capable of supplying water for the irrigation of the 800,000 ac. in the enlarged Imperial irrigation district and about 150,000 ac. in the Coachella Valley County water district.

During the year the Imperial irrigation district completed the first unit of a system to utilize the power possibilities of the All-American canal. This unit includes two hydro-electric plants at drops on the canal with a total net capacity of about 14,500 kw. a diesel stand-by plant with a total net capacity of 12,000 kw. and over 1,200 mi. of a transmission and distribution system delivering power to all parts of Imperial valley, both urban and rural. About 60,000 kw. can be developed on this canal.

Canada.—In Alberta and Saskatchewan only minor new developments are completed or actively inaugurated during 1940. The Leavitt project, taking water from Belly river in southwestern Alberta and supplying 4,000 ac. of land, was completed. A number of small projects utilizing local prairie supplies to irrigate from a few acres to a few hundred acres each are completed or in process of completion.

Surveys and investigations of the Lethbridge southeastern project (in Alberta) to extend the irrigable area by about 300,000 ac. continued. Surveys were completed for the McLeod irrigation project, taking out of the main canal of the Lethbridge northern irrigation district, by pumping, to irrigate 10,000 ac. of land.

All of the above works are under the Prairie Farm Rehabilitation act, administration offices of which are in Regina, Sask.

Netherlands.—Activities in building the second polder of the Zuider Zee reclamation scheme were continued in 1940 and it is presumed that the occupation of the country by foreign forces did not stop the reclamation work, for reasons of unemployment relief and the creation of productive land.

During the days of actual warfare in Holland, the main dike between North Holland and Friesland, which encloses the IJssel-lake and made the building of polders possible, was not destroyed, notwithstanding some fierce fighting at the Friesland end of the dike.

India.—The Thal irrigation project, which was taken in hand immediately after the opening of the Haveli project, is designed to irrigate from the Indus over 1,000,000 ac. of land in the Thal desert lying between the Indus and the Jhelum rivers in the Punjab. The headworks will be at Kalabagh and will comprise a barrage 3,800 ft. long with 56 gates. The gates will be 15 ft. long, 15 to 18 ft. high and capable of taking a static head of about 10 ft. The gates will have a maximum discharge capacity of 1,200,000 cu. sec. At the time of diversion a discharge of between 20,000 and 60,000 cu. sec. is anticipated which is many times greater than the discharges which have had to be dealt with at previous diversions in the Punjab.

Elaborate desilting works are proposed at the canal head. Upstream of the canal regulator will be a silting flume 2,000 ft. long from which silt will be continuously extracted through numerous small outlets distributed over the length and breadth of the flume. The bed of the flume will be lined and corrugated longitudinally to guide the silt to the orifices.

The capacity of the canal will be 6,000 cu. sec. and it is proposed to line the main canal and the branches, comprising about 260 mi. of channel, with reinforced brick masonry. The lining of the distributaries with a cheaper lining of the same type is under consideration.

Iran.—While Persia, or Iran as it is officially called, was one of the earliest countries of the world to use irrigation, it is only during the past few years that a revival of interest in this subject has come about. The government of Iran was in 1940 greatly interested in increasing the irrigated area and in making irrigation water more effective.

In many parts of the country dam sites and irrigation canals in 1940 are being surveyed and estimates prepared to determine costs. In the vicinity of Kermanshah, on the headwaters of the Karkheh river, two projects were constructed or were under construction during 1939-40. In the vicinity of Khurramabad, the irrigation structures were being enlarged. In Khuzistan, considerable development in irrigation work was under way. Many pumping plants were being established in the lower part of the Karkheh river west of Ahwaz. The Karun river, which is the largest in Iran, was being tapped in a number of places and plans were being developed in the vicinity of Shustar, which was the site of ancient irrigation works.

Along the Kur river, in the province of Fars, canals were being extended

along the channels of old canals which furnished irrigation water for ancient Persepolis in the days of Darius the Great. Along the Gurgan river, east of the Caspian sea, many pumping plants were being established and one large dam on the Gurgan river below Gunbad-i-Qabuz, was designated to furnish water for the Gurgan plain, where extensive areas are suited to the growing of cotton.

Mexico.—Angostura dam on the Bavispe river, 100 mi. south of Agua Prieta, Sonora, Mexico, which was started in 1937, was completed Dec. 1, 1940. This is the first of three dams in a project being developed by the Mexican government's irrigation and reclamation commission and will provide an assurance of water for the irrigation of crops in the Yaqui valley, 200 mi. south of the dam. The dam is of the concrete arch type with a maximum height of 300 ft., 100 ft. thick at bedrock and 12½ ft. thick at the top. It will contain 225,000 cu.yd. of concrete and will create a lake 25 mi. long and 8 mi. wide at its widest point. The gross storage capacity is estimated as 1,029,500 ac.ft., of which 81,100 ac.ft. are provided for silting. It is expected that 740,800 ac. of additional land will be brought under irrigation after the completion of the Angostura dam.

The second step in the irrigation and reclamation commission's project will be the construction of the Camellon dam in the Aros river. The reservoir created by this dam will have an estimated storage capacity of 486,000 ac.ft. and will serve to irrigate 123,000 ac. of additional land.

The third step involves the construction of El Aguila dam on the Yaqui river, which will impound 1,459,000 ac. ft. of water. It is estimated that the irrigated area will be increased by about 309,000 ac.; making a total of about 741,000 irrigated acres in the entire Yaqui river zone.

Brazil.—In northeastern Brazil, extensive tracts of land in the states of Piahy, Ceará, Rio Grande do Norte, Parahyba, Pernambuco, Alagoas, Sergipe and Bahia, are subject to general or partial droughts. In these regions, which embrace about 258,000 sq.mi., with a population of 6,000,000 inhabitants, there were in construction in 1940, by the Brazilian government, five irrigation projects, to reclaim about 750,000 ac., and including storage and regulation dams, irrigation and drainage canals and about 6,000 mi. of roads. (See also DAMS.)

Islam. The year 1940 was marked by no striking movements within the Islamic world, though the remarkable revolutions on the continent of Europe certainly led to a more self-reliant attitude in Islamic countries. Turkey strengthened her position as a great factor of stability in the eastern Mediterranean. The Mecca pilgrimage (Jan. 20, 1940) attracted about 50,000 foreign pilgrims.

In Saudi Arabia there was some agricultural development in the district of Kharj in Nejd, a district which was famous of old for its great fertility and which still has abundant supplies of water. The use of motor cars continued to expand. Trade advanced. Gasoline production in Hassa was extended by the discovery of petroleum in great quantities in a well in another field at a depth of 10,000 feet. The result was a further development of the port of Ras Tanoora on the Persian gulf.

European events cast their shadow on the Islamic world. The noted Pan-Arabian leader, Emir Shekib Arslan, definitely gravitated towards the axis powers in 1939. Previously there had been a great deal of ridicule of Mussolini's claim (1937) to be the "protector of Islam." The fascist designs on Tunisia and Islamic North Africa generally had been acridly criticized, and a certain amount of sympathy had been created for France in the expectation that French policy would tend towards the liberation of Islam from autocratic outside control. The visit of the French premier, M. Daladier, to Tunisia (Jan. 1939), had been well received. The French savants, too, had done more than any other non-Islamic scholars to study and encourage the cultural and literary movements in modern Islam.

But after the fall of the popular front government in France (Nov. 1937-Dec. 1938), the feeling seems gradually to have changed, until, with her collapse, France ceased for the time being to be a factor of major importance in Islamic politics. It is possible, however, that the emergence of support for General de Gaulle's Free French Africa may bring Islamic movements again into the full current of world politics.

In India and in North Africa there were side by side an ad-

herence to old local customs and an enforcement of strict Islamic law. This has given rise to a great deal of conflict in courts of law, as the dividing line between the two was never very clearly defined. The modern tendency, especially among the educated classes, is to substitute the precisely defined provision of the Shari'at for the loosely enforced and elastic provisions of ethnic or tribal custom. The aims of the Khaksars in Northern India are stated to be religious and social reform, but they tend to take a political colouring, and the party has come into conflict with the provincial governments both in the Punjab and the United Provinces.

Fascist relations with the Muslim world have tended to deteriorate with the development of their policy in Abyssinia and Libya. Both in the matter of land and in the exercise of civic rights Italian colonists have been placed in a specially favoured position, and the Muslims have been proportionately depressed. Italy's incursion into Somaliland, a purely Muslim country, may be an additional factor in ranging Muslim opinion against Italy.

A law was passed in Greece (1940) granting a piece of ground for building a mosque in Athens. (A. Y. A.)

Italian Colonial Empire. The table gives essential information relating to the Italian colonial empire. Total area 1,486,914 sq.mi.; total population 58,418,000.

History.—In the first half of 1940, before her entry into the war (June 10), Italy continued her policy of making her empire economically self-supporting. General Teruzzi stated in January that private capital invested in Africa amounted to some 5,000,000,000 lire; more colonists from southern Italy were settled in Libya and East Africa; it was reported in April that some 25,000 "workmen" had been landed in Albania—at the same time as fleet exercises were in progress in the Dodecanese and off the Albanian coast; and the attempts to hold down recalcitrant chieftains in Abyssinia were not relaxed. At the Brenner meeting between Hitler and Mussolini on March 18 one of the "eleven points" said to have been discussed was that Italy should have post-war privileges in Jibuti and Tunis and in the management of the Suez canal, and

"DARKEST AFRICA" had its fill of superior culture in 1940, according to Messner of the Rochester Times-Union

in the same month the fusion of the Albanian and Italian armies was completed.

Meanwhile the defence of Libya proceeded apace, and there were many indications that Italy was about to become a belligerent. Warlike speeches were made at the celebrations of the fourth anniversary of the proclamation of the empire (May 9), while shortly before Count Grandi claimed that the fascist empire could not remain on the outskirts of the conflict and that its people "powerful in its arms, strong in its right, conscious of its mission formed from the Alps to the Indian ocean a compact army of

5,000,000 soldiers." Nervousness increased in adjacent areas: at the end of April British shipping was temporarily diverted from the Mediterranean to the Cape route, and before the middle of May the British Mediterranean fleet had reassembled at Alexandria and Egypt was taking defence measures. On June 4 the Italian law for the organization of the nation at war was extended to Italian Africa, and on June 10 Mussolini declared war against the plutocratic and reactionary democracies of the west." From that moment civilian activities in the Italian colonial empire ceased. (See also EUROPEAN WAR.)

Italian East Africa: see ITALIAN COLONIAL EMPIRE.

Italian Literature. During the past 15 years Italian writers have been encouraged to seek their inspiration in the "new era." Numberless literary prizes have been offered and granted. Withal, 1940's literary output gave further proof that creative writing is a plant which does not flourish under a totalitarian sky. For intellectual solace the reading public turned to the old masters which publishers have been re-editing. Critics, in conformity with this tendency, continued to explore and re-evaluate the literature of the middle ages, the Renaissance and especially that of the last hundred years. The outstanding books of 1940 belonged, of necessity, to this scholarly trend.

The *Storia della letteratura italiana* by F. De Sanctis was rediscovered and proclaimed an unsurpassed masterpiece of literary criticism. The two-volume edition by B. Croce (Laterza) was revised and Hoepli was publishing a monumental new edition. Flora produced a scholarly yet practical *Storia della letteratura italiana* (Mondadori) in three volumes, the third in collaboration with L. Nicastro. Noteworthy for the light they shed on recent currents were A. Gargiulo's *Letteratura italiana del Novecento* (Le Monnier) and G. de Robertis' *Scrittori del Novecento* (Le Monnier). B. Croce's *Letteratura della nuova Italia* was completed with the publication of the sixth volume. M. Apollonio added a second volume on the Renaissance to his *Storia del teatro italiano* (Sansoni).

The inexhaustible personality and philosophy of Leopardi inspired new studies, the most significant of which were G. Ferret-

ti's *Vita di Giacomo Leopardi* (Zanichelli) and A. Tilgher's *La filosofia di Leopardi* (Religio). Bio-critical works on notable figures of various periods, some based on newly discovered documents, were numerous. The most prominent included N. Valeri's *La Vita di Facino Cane* (Soc. Sub. Edit.); *Metastasio* (Zanichelli) by L. D'Ambra who died in Dec. 1939; M. Saponaro's *Carducci* (Garzanti); M. Rumor's *Giacosa* (C.E.D.A.M.); A. Codignola's *Un dramma intimo di Cavour* (Garzanti); A. Monti's *Clara Maffei e Carlo Tenca* (Garzanti). The interest in epistolaries justifiably continued unabated with G. Galilei's *Frammenti e lettere* (Sansoni); Cosimo I de' Medici's *Lettere* (Vallecchi) and some thousand *Lettere scelte* of A. Fogazzaro (Mondadori).

The ever-changing map of Europe stimulated the writing of histories of various countries of Europe and the Mediterranean basin, the majority *ad usum delphini*. *Spagna di Dio* by O. Pedrazzi (Garzanti) and *Storia dell'Imperialismo inglese* (Ist. Fascista dell'Africa italiana) typify this category. On the other hand, a goodly number of scholarly works also appeared, such as those on the *Mediaeval Guilds* (Le Monnier); A. Sorbelli's *Storia della Università di Bologna*, vol. i (Zanichelli); F. Valsecchi's *L'Unificazione italiana: 1854-1859* (I.S.P.I.); L. Salvatorelli's *La Tripla Alleanza* (I.S.P.I.).

The growing awareness of the Americas found expression in N. Cuneo's *Storia della emigrazione italiana in Argentina (1810-1870)* (Garzanti); A. F. Guidi's *Relazioni culturali fra Italia e Stati Uniti d'America* (C.E.D.A.M.) and in a book of impressions by an artist, *America amara* (Sansoni) by E. Cecchi, which contains bitter words on the political life of the United States.

In the field of fiction many young writers, following government instructions, extolled fascist heroes, the joys of motherhood, agricultural life in East Africa or, as in *Mal di paese* (Garzanti) by E. Rivalta, the irresistible "call of the blood." However, they appeared not to enjoy public favour. The old guard, not inspired by the new order, pursued the dissection of their adolescence: B. Cicognani's *L'età favolosa* (Garzanti). Life in boarding school seemed a favourite topic for both old and new writers: O. Vergani, *Recita in collegio* (Garzanti); E. Mascagni, *Compagne di collegio* (Garzanti). But the novel which attracted most attention, *Catarina Marasca* (Garzanti) by G. Gulli, depicts the realities of present-day life. Its author is a 23-year-old Calabrian girl who died of starvation before her book appeared.

The activity of the Italian writers in exile was crippled by

FUNERAL PROCESSION of Marshal Italo Balbo and his flight companions at Tripoli, July 3, 1940. The governor-general of Libya was shot down June 28, according to the Italian government, by a British warplane while flying over Tobruk.

the fall of France. Nevertheless G. Ferrero succeeded in publishing *Reconstruction, Talleyrand à Vienne, 1814-15* (Plon). In the United States there appeared C. Sforza's *Fifty Years of War and Diplomacy in the Balkans and Neither Liberty nor Bread*, edited by F. Keene, an important work on the meaning and tragedy of fascism written by 42 Italian writers in exile. (M. F. C.)

Italian Somaliland: see ITALIAN COLONIAL EMPIRE.

Italy, a kingdom consisting mainly of the peninsula projecting south into the Mediterranean from the mass of central Europe; the land boundaries, which reach as far north as the parallel of 46°40' N., being formed by France, Switzerland, Germany and Yugoslavia. Capital, Rome. Ruler: King Victor Emmanuel III (b. 1869, *succ.* 1900). National flag: green, white and red in vertical stripes, with the arms in the white stripe.

Area and Population.—Excluding Libya: area, 119,764 sq. mi.; pop. est. (Jan. 1, 1939), 44,394,000. Chief cities (pop. 1936): Rome (1,155,722), Milan (1,115,848), Naples (865,913), Genoa (634,646), Turin (629,115). Language, Italian; religion, Roman Catholic.

History.—Completely overshadowing all other Italian interests during 1940 was Italy's entry into the war on June 10. When the year opened it was by no means certain that Italy would become an active belligerent. In Dec. 1939, Ciano, foreign secretary, had explained that while Italy was Germany's ally there was an unpublished proviso in the "Pact of Steel" (the axis alliance) by which Italy might avoid war for three years if that time should be necessary to prepare for hostilities. Furthermore, for the time being Hitler did not need Mussolini's help, and Italy's nuisance value was worth more to Germany than any actual Italian aid.

Early in 1940, indeed, Italy seemed almost more anti-Russian than anti-French and anti-British, since it was alarmed at the Russo-German pact of 1939 which went further than it had expected, and Italian sympathy for the Finns in their death-struggle with the soviets was widespread. Crowds in Rome demonstrated for Finland and Italian aeroplanes were dispatched to aid the Finns. A Russia, victorious in the north, might turn an ambitious eye to the south, and Italy was desperately anxious to ward off any Russian invasion of the Balkan peninsula, a region in which it hoped to expand.

By the middle of February, however, a shift could be noted in Italian foreign policy, due mainly to quarrels with Britain. The latter country had sought to conciliate Mussolini by trading raw materials for machinery, and during the first five months of the war Italian industry had flourished by trading no less than \$250,000,000 worth of machinery with the Allies. But there was another side to the picture. The British blockade at both ends of the Mediterranean interfered extensively with Italian trade, particularly in those products which might be re-exported to Germany. An Anglo-Italian trade conference came to an untimely end and the Italian press attacked Britain bitterly.

The winter of 1939-40 was unusually severe and there was a food shortage in Italy. On Jan. 15 sugar and coffee were rationed, the former at 17½ oz. per person, per month (one-third less than in Britain), and the latter at 3 oz. More important was the scarcity of coal. Hitherto it had reached Italy either overland or by sea from Britain, Germany and Poland. The overland route was expensive and furthermore the Danube over which most of it came was tightly frozen. The sea route lay at the mercy of the royal navy. The British were willing to supply Italy with coal but they refused to let Italian ships convoy German coal from Rotterdam. When the British seized Italian colliers in March, Mussolini became so angry that Britain thought it advisable to release the colliers.

But now the Duce's blood was up. "The Sphinx of the Tiber" had little to say for publication, but on March 18 it was noted that he conferred with Hitler at the Brenner, and as the German struck at Scandinavia (see NORWAY; DENMARK), the Italian press launched into a concerted attack upon Britain, "saluting," as it did so, "German soldiers who have fallen on Norwegian soil" (the Italians had abundant sympathy for Finns but none for Norwegians or Danes) and announcing that "the bugle is about to sound." Concomitant with German victories in the Netherlands and Belgium in May were louder and more defiant blasts of defiance from Italy. On May 9, the fourth anniversary of the new Italian empire, the Duce bluntly told his people: "After my speeches you must accustom yourself to my silence. Only the facts will break it." And on May 22, the first anniversary of the alliance with Germany, Ciano said, "Italy cannot remain neutral from the present terrible struggle."

Meanwhile the Italian people were whipped into frenzy by poster propaganda which laid all responsibility for the increased cost of living on the British blockade. The *Osservatore Romano*, the Vatican newspaper, was boycotted because it published the war news from all quarters. Pro-axis news alone was permitted to circulate. Preparations for the universal exposition at Rome which was to represent in 1942 the 20th year of triumphant fascism were abandoned and feverish war mobilization took place.

On June 10 the Duce took the plunge. He declared war on Britain and France for three ostensible reasons: France and Britain were "pluto-democracies," rank with decadent capitalism and so the natural enemies of the new order in Europe; they had joined together to hold Italy imprisoned in the Mediterranean sea and it was determined to break its bonds; and finally, his fascist word of honour demanded that he stand by his ally, Germany. A fourth reason was not stipulated. Since the war seemed well-nigh over, France beaten to its knees and Britain left to fight alone, if Mussolini wanted to be in at the kill it was necessary that he hasten.

Italy's war with France lasted 16 days during which reports differ as to just what Italian arms accomplished. According to Mussolini his troops broke through the entire line of the French fortifications on the Italian border, penetrating France in distances from 5 to 20 miles. Two French destroyers were also said to have been sunk by the Italian navy. On June 24 came the armistice. The Italians were to retain for the duration of the war such gains as they had made in France proper; in the colonies, the French were to demilitarize a considerable zone in Tunisia west of Libya; French Somaliland was to be demobilized.

During the second half of 1940 Italian arms scored some slight success only to meet in December with extraordinary and unexpected defeat. The strategy of the war called for an attack by Italy on the Suez canal, an important lifeline of British commerce and an essential conquest if Italy was to break out of its "prison house." The Suez was far away, even from Italy. It might be attacked from the water, but when France collapsed and the French navy was interned or destroyed by the British the latter added several battleships to its already formidable Mediterranean squadron thus making it superior to the Italian fleet.

The latter soon proved incapable of inflicting any extensive damage on the royal navy. Theoretically comprising a huge number of destroyers, submarines and swift motor torpedo craft, it was designed for a "hit and run" warfare. But in this war there was more run than hit. The Italian ships kept pretty much in home waters, fleeing when attacked and scoring only a few very minor victories. On the other hand the British ships could not get at their elusive foe; they did manage to sink a cruiser and some light craft, but the main fleets of the two powers never came to grips in all the year.

ITALIAN STUDENTS demonstrating for entry into the war shortly before Mussolini's decision of June 10, 1940

To approach the Suez by land was difficult. To the north and east lay the Sinai desert; beyond that Palestine (garrisoned by British troops); beyond Palestine, Syria (still garrisoned by the French); and still farther lay Turkey, a neutral state, friendly to Britain. Italy could not very well hit at the canal from this direction.

To the south of the canal was Egypt and the Anglo-Egyptian Sudan. The latter abutted on the new Italian colony of Ethiopia, and since the Italian garrison there was large, a foray toward the Nile was quite possible, and one was made scoring a minor Italian victory in the northern Sudan where some villages were taken. Likewise from Ethiopia Italian troops pressed directly south to the British colony of Kenya, the outlying districts of which they successfully invaded.

The Italians had even better luck with British Somaliland, a worthless desert region from the economic point of view, but of some slight value strategically since it lay opposite Aden, the British fortified port in Arabia which commanded the southern approaches to the Red sea. The Italians threw some 20,000 to 30,000 men against British Somaliland in August and conquered it completely, the outnumbered British garrison escaping by sea. The Suez also could be approached by land from the west and since the Italians had in Libya at least 250,000 men the danger point was here. Before the defeat of France it was believed that French troops in Tunisia readily could prevent any movement of these Libyan forces against Egypt. But now France was out of the war and the handful of British troops in Egypt were in real danger of being caught between the 250,000 Italians in Libya and the 100,000 Italians who garrisoned Ethiopia. Fortunately for England it was summer, an almost impossible season for an Egyptian campaign. If the British could only stave off the Italian advance long enough it was believed that sufficient reinforcements would flow in from Australia and New Zealand to stem the tide. And that is about what happened. The Italians could not reinforce their Ethiopian army, but they could and did strengthen that of General Graziani in Libya, who began in late summer a much-advertised offence against Egypt along the Libyan littoral. By the middle of September he had penetrated 80 miles within the Egyptian border to Sidi Barrani and then went no farther. The heat was terrible, the single road upon which he could advance open to attack from the desert and the sea, and all of his water

had to be carried by pipe line from his base. Perhaps these were the reasons which led to the sudden "bogging down" of the expedition. It could hardly have been the military opposition of the British; they had been able to do little but harass his advance by air attack. Or there might have been other reasons; the failure of the Italians in Ethiopia to make a counterthrust at the expected moment might have been one, the Balkan situation another.

Mussolini was worried about the Balkans. The Russians already had compelled Rumania to disgorge Bessarabia; Hitler apparently was supplanting him, the Duce, in the good graces of the Magyars, and Hitler rather than Mussolini had won for Hungary most of Transylvania. There were strong German detachments in Rumania, ostensibly to guard oil wells. The plain facts were that both Germany and Russia were gaining in Italy's back yard, and Italy by inference was losing face in the Balkans.

The Duce was determined that this should not be. Complaining officially about Grecian bandits in Italian Albania, the Duce delivered an ultimatum to Greece on Oct. 28, 19th anniversary of the fascist march on Rome, demanding that Greece surrender certain bases to Italy. War followed. Italy invaded Greece from Albania and almost immediately met with disastrous defeat.

The weather was bad, the terrain difficult and the Greeks better armed than the Italians had expected. But despite these factors it is difficult to explain the collapse of the Italian morale in Greece and in Albania except on the ground that the Italians had no stomach for fighting.

The Greeks were not only able to drive the invader out of their country, they invaded Albania in return; captured valuable war booty, guns, munitions, trucks; threw the retreating Italians into utmost confusion; forced their own way through southern Albania until by the end of the year the Greeks were within 30 miles of the Italian base at Valona.

As these things happened the royal navy crippled a number of Italian battleships with torpedo planes, and the British army, heavily reinforced from Australia, surprised the Italians in Egypt, captured Sidi Barrani, compelled the surrender of 40,000 Italians, drove back Graziani's army and on Dec. 31 were besieging it in Bardia, in Italian territory.

Education.—Public elementary schools, 131,580; pupils, 5,411,596. Students in secondary schools, 647,505; in universities, 77,429. A special school charter of 1939 required all education in Italy to have a fascist stamp.

"HOW Y' DOIN', ADOLF?" Comparative estimate of the Axis' military accomplishments before the British got under way in Africa during Dec. 1940, by Manning in the *Phoenix Arizona Republic*

Defence.—Army, 900,000; planes, 5,500; battleships, 6; cruisers, 22; destroyers, 61; torpedo boats, 71; submarines, 105 (figures for 1939).

Finance.—Estimates for year ending June 30, 1940: revenue, 24,560,000,000 lire; expenditure, 29,316,000,000 lire. Lira quoted Dec. 1939 at 5 cents.

Trade and Communication.—Imports, 11,061,000,000 lire; exports, 8,007,000,000 lire. Railway, 29,220 km. Shipping: 2,301 sailing vessels, 1,057 steamships, 293 motorships. Total over 2,000,000 metric tons.

Agriculture, Manufacture and Minerals.—Livestock in 1938: horses, 791,120; asses, 791,390; mules, 431,150; cattle, 7,666,890; pigs, 2,940,440; sheep, 9,467,400; goats, 1,828,070. In thousand quintals: wheat, 12,420,000; maize, 3,724,000; beans, 1,625,000; olives, 2,038,000.

Most important industry, the textile. In 1938 it had 938 factories. In minerals, sulphur continued to lead, there being mined, in 1938, 2,363,000 metric tons of sulphur, to 930,000 tons of iron pyrites, next competing mineral. Japan, an empire, capital, Tokyo; ruler, Emperor Hirohito, premier, Prince Fumimaro Konoye. A chain of islands in the western Pacific, stretching from South Sakhalin (50° latitude) to the South Seas mandated islands (which lie near the equator); includes Chosen peninsula, on the mainland of Asia and the small Kwantung leased territory, with the city of Dairen on the Liaotung peninsula. Japan proper consists of the four larger islands of Honshu, Hokkaido, Shikoku and Kyushu (with many adjacent smaller islands). Chosen, Formosa and South Sakhalin are administered as colonies, along with the South Sea islands, former German possessions, which were granted to Japan under a mandate from the League of Nations after the World War (1914–18). The total area of the Japanese empire in 1940 was 263,359 sq.mi., of which Japan proper represented 148,755 sq.mi. Population of the empire (census Oct. 1, 1935) 97,697,555. This figure had increased to 103,087,100, according to an estimate of the Cabinet Statistics bureau of Dec. 1, 1937.

History.—*Japan in China.*—The course of the war in 1940 would seem to indicate that the Japanese had reached the physical limits of possible conquest and occupation. Their troops (it is estimated in some quarters that in 1940 the Japanese had 1,000,000 men in China and Manchoukuo) were spread out thinly over long lines of communication and further advances, as a rule, would bring the Japanese army into mountainous, difficult country, without railways or good roads. About the only significant military forward movement during the year was the capture of Shasi and Ichang, on the Yangtze river, about 300 mi. above Hankow. On the other hand, the Japanese toward the end of October evacuated Nanning and the part of western Kwangsi province which they had previously occupied, on the ground that their movement into Indo-China made the holding of this part of Kwangsi superfluous. On July 6 the Japanese army stated that Japanese losses in killed were 85,800, while 1,587,600 Chinese had been killed and 617,260 sq.mi. of Chinese territory had been occupied. These casualty estimates are vigorously contested by Chinese sources. The shrinkage of the area planted with cotton in North China was an indication of the failure of the Japanese to establish effective control of the agricultural hinterland in this region, since Japan looked forward to developing a source of cotton under its control in this part of China.

On March 30 Wang Ching-wei, veteran member of the Kuomintang who had left Chungking toward the end of 1938 and had come to an agreement with Japan, set up a self-styled, new government of China in Nanking and on Nov. 30 Japan recognized this regime. This had no visible effect on the course of hostilities, a train between Shanghai and Nanking being dynamited by Chinese guerrillas on the eve of the formal Japanese recognition of Wang Ching-wei's government.

Japan and the European War.—Japan's attitude toward the war in Europe remained one of nonparticipation; but there was a distinct swing in official sympathy toward the axis powers after the German victories in the Low Countries and in France in May and June. In the first months of the war Japan's attitude had been cautious and reserved, partly because the Soviet-German pact of Aug. 24, 1939, was a distinct shock to Japanese diplomacy.

But on Sept. 27, 1940 Japan, Germany and Italy signed a tripartite alliance in Berlin. Its main points were that Germany and Italy would respect Japan's position of leadership in the "new order" in East Asia, that Japan would maintain a similar attitude in regard to the position of Germany and Italy in Europe, that should any of the allied powers be attacked by a third power not in

ved in the war the other two should render all possible political, economic and military assistance; that the pact would not alter the status quo as between the allied powers and the soviet union. This treaty received several official comments and elaborations. Premier Konoye declared on Oct. 4 that if the U.S. would recognize Japan's leadership in east Asia Japan would recognize the United States' leadership in its continent. On the other hand, if the U.S. should challenge the new alliance, war would be the result. Foreign Minister Yosuke Matsuoka, in an interview granted to U.S. newspapermen on Dec. 9, 1940, stated that the tripartite pact dominated Japan's foreign policy, but that Japan would only feel obliged to fight if it were convinced that the U.S. was the aggressor, in the event of a conflict between the United States and Germany.

Japan and the United States.—The year 1940 was a year of increasing tension between Japan and the United States. No progress was realized in harmonizing the opposed views of the two countries, which ranged over a wide variety of subjects, from the larger implications of Japan's so-called "New Order in East Asia" to specific U.S. grievances about trade discriminations suffered by U.S. citizens in regions under Japanese military occupation.

The U.S.-Japanese commercial treaty, which had been denounced by the United States government, with six months' notice, in July 1939, expired on Jan. 25, 1940 without any renewal. During the year the U.S. took advantage of its new freedom of action to impose restrictions on exports to Japan on three occasions. The exportation of gasoline of high octane content, suitable for aviation, was forbidden in July. Scrap iron was barred in September and a licensing system with restrictive implications was introduced for ferro-alloys and for iron and steel manufactures in December. While these measures were officially attributed to the needs of the United States' own defence they were widely interpreted both in the U.S. and in Japan as being designed to limit Japan's acquisition of strategic raw materials from America. The United States state department several times challenged actual or possible Japanese moves of expansion on the Asiatic continent. When the Wang Ching-wei regime was inaugurated in Nanking on March 30 Secretary of State Cordell Hull characterized this as "a further step in the program of one country to impose by armed force its will upon a neighbour, blocking a large area from normal political and economic relations with the rest of the world." On April 17 Mr. Hull, at a time when rumours of Japanese action against the Netherlands Indies had gained circulation, announced that the United States stood unequivocally against "any intervention in the domestic affairs of the Netherlands East Indies or any alteration of their status quo by other than peaceful means."

No overt action by Japan against the Netherlands Indies took place; but a similar warning from Mr. Hull about the disapproval of U.S. public opinion of any forceful change in the existing order in French Indo-China was disregarded when the Japanese moved to the northern part of this French colony in the latter part of September. Japanese recognition of Wang Ching-wei's regime coincided with the announcement by the U.S. government of a new credit of \$100,000,000 for the Chinese Nationalist government at Chungking. Half of this sum was guaranteed by Chinese exports of tungsten, wood-oil and other commodities; the other half was designed to strengthen the Chinese currency.

Early in October the state department advised Americans whose presence was not urgently required to quit the orient and a considerable number of women and children and a smaller number of men returned to the U.S. from Japan, China and the Philippines. The long-established, American-owned *Japan Advertiser*, a Tokyo daily newspaper, was sold to Japanese ownership. The Japanese government appointed Admiral Kichisaburo

Nomura, a veteran naval officer of moderate views, ambassador to the United States in November. While Admiral Nomura's sentiments were known to be favourable to rapprochement between the two countries the Japanese press expressed scepticism as to what he would be able to accomplish, in view of the unfavourable atmosphere which he would encounter.

Japan and Other Powers.—Japan's relations with Great Britain, strained since the beginning of the war in China, remained cool and sometimes troubled, although Great Britain, because of its life-and-death struggle in Europe, displayed a tendency to leave the initiative in far eastern matters to the United States. British troops were withdrawn from Tientsin and Shanghai, thereby reducing the possibilities of friction with the Japanese forces of occupation. A dispute arose when a British warship stopped the Japanese liner "Asama Maru" in January and took off 21 Germans; a compromise settlement was reached when nine of the Germans were handed back as over military age.

Great Britain made one important concession to Japan when it consented to close the Burma road, one of China's few remaining links with the outside world, for three months, beginning on July 17. Soon afterwards, however, the Japanese police arrested a number of Britons in Japan, accusing them of espionage. One of those arrested, the correspondent of Reuter's news agency, James M. Cox, committed suicide, according to the Japanese version, while in the custody of the police.

The conclusion of the pact with Germany and Italy apparently convinced the British government that there was little hope of conciliating Japan; and the Burma road was reopened to traffic on Oct. 17.

Japan's relations with the soviet union were rather ambiguous; but there was a noteworthy absence of such sharp border fight-

"LITTLE MAN HAVING TOUGH TIME." Costello's conception in the *Knickerbocker News* (Albany, N.Y.) of Japanese success during 1940 in attempting to end the "China incident"

A TOAST IN NAZI FASHION to the Japanese-German-Italian pact signed Sept. 27, 1940, was drunk in Tokyo by (left to right) Italian Ambassador Indelli, Japanese Foreign Minister Matsuoka, German Ambassador Ott and Heinrich Stahmer, a special Nazi envoy

ing as took place at Changkufeng in 1938 and at Nomonhan in 1939. A new Japanese ambassador to Moscow, General Tatekawa, took up his post in the autumn with instructions to work for the conclusion of a non-aggression pact with the Soviet Union; but there had been no visible developments in this field up to the end of the year.

Japan took advantage of France's collapse in Europe to press demands for the cession of air bases in Indo-China. The entrance of the Japanese troops into this French colony late in September was accompanied by some fighting, apparently because one Japanese general was not informed of or was indifferent to an agreement which had been concluded between other Japanese military authorities and the French officials. There was also some desultory fighting in the autumn along the frontier between Thailand (Siam) and Indo-China. Thailand demanded the retrocession of territory which had formerly been taken over by Indo-China. It is not clear on the basis of available information whether and how far the Japanese extended their military penetration of Indo-China to the southern part of the very large colony.

Japanese Internal Developments.—Internal political life in Japan went on without important changes during the cabinet of Admiral Mitsumasa Yonai, who succeeded General Nobuyuki Abe in January. But after Prince Fumimaro Konoye, who had been premier at the beginning of the war in China, resumed this office on July 23, 1940, there were interesting and striking developments in the direction of a more totalitarian type of state. These developments were probably motivated partly by the increasing stringency of the economic situation, partly by a tendency to imitate the political form of the states which seemed to be victorious in Europe.

All the Japanese political parties went through a process of self-dissolution. A so-called "Imperial Rule Assistance Association," with a hierarchical organization dictated from above rather than from below, but with branches in the smallest villages, was set up. Just how its functions will dovetail into those of the Diet is not clear; but the whole governmental trend is toward greater authoritarianism. Bodies with international affiliations such as Rotary clubs and Christian churches found it expedient to dissolve or to reorganize themselves, as the churches have done, on a basis of excluding foreign executives and foreign financial aid.

The pinch of war began to be felt more acutely in daily life in 1940. Matches and sugar were rationed; the sale of rice was controlled and the authorities urged the people to economize in its use; many foodstuffs were hard to obtain; wool and cotton clothing disappeared from the market, being replaced by very inferior staple fibre products. There was a water shortage in Tokyo and in some other large cities as a result of drought and

the increased demand which is associated with a larger population.

Education and Religion.—There were 48,215 schools of all kinds in Japan in 1937, with 15,242,333 students and pupils. Elementary education is compulsory and the percentage of children attending the schools was 99.59. There were 45 universities in Japan in 1937, with 72,195 students. The Japanese constitution provides for freedom of religion. Certain acts of reverence before Shinto shrines are regarded as demonstrations of loyalty to the state, not as enforced profession of the Shinto religion. The latest statistics (end of 1933) show that there were 41,127,307 Buddhists, 16,525,840 Shintoists and 439,444 Christians in the country.

Army and Navy.—The Japanese army is raised on the basis of universal liability to service of all male Japanese between the ages of 17 and 40. Its official peacetime strength is a little under 250,000, organized in 17 divisions and 34 brigades. All information about the strength of the army has been withheld since the beginning of the war in China. It has been sometimes estimated that Japan has in the neighbourhood of 1,000,000 men under arms on the mainland of Asia. The distribution of these forces between Manchoukuo, north, central and south China shifts and varies with the needs of the situation. There have been reports of substantial military concentrations in Formosa and in occupied Hainan island, off the southwestern coast of China. The navy has also been entirely secretive as to its strength and building plans since the denunciation of the Washington treaty of naval limitation. Before the policy of secrecy went into effect the Japanese navy, as of Sept. 30, 1936, was officially reported to possess 302 warships, of 1,134,823 tons, including 9 battleships, 12 first class and 25 second class cruisers, 6 aircraft carriers and 3 seaplane carriers. Under the last published fleet replacement law the Japanese naval building program between 1936 and 1943 called for the construction of 4 battleships, 2 aircraft carriers and a considerable number of cruisers, destroyers, submarines and other vessels.

Banking and Finance.—The unit of currency is the yen (worth 23.48 cents in United States currency in Dec. 1940). This is the official rate, maintained by law and by penalties imposed on the private conversion of foreign currency into yen. The value of the yen in private exchange in the free market of Shanghai is much lower. The Japanese budget of 1940-41 (the fiscal year ends on March 31) reached the record figure of 9,957,000,000 yen. Most of this sum will be covered by new government bond issues which are authorized for a figure of 5,580,000,000 yen. Japan's internal loans at the end of June 1940 amounted to 23,046,076,000 yen. The total note issue of the Bank of Japan was 1,865,703,380 yen at the end of 1936; this figure had increased to 3,380,290,000 yen in June 1940. Japan's external debt, on which service has been consistently maintained, is a little less than 1,300,000,000 yen, but the debt burden is somewhat heavier than this figure would indicate, because the foreign debt is mostly in terms of pounds and dollars, and these currencies have been devalued less than the yen.

The Bank of Japan is the central bank of issue. The Yokohama Specie bank is in charge of foreign exchange transactions and finances foreign trade. Commercial banking is largely in the hands of seven large banks: the Mitsui, Mitsubishi, Dai-ichi, Sumitomo, Yasuda, Daihaku, and Sanwa. Among the foreign banks which operated in Japan in 1940 were the National City bank of New York, the Hongkong and Shanghai Banking corporation, the Chartered Bank of India, Australia and China, the Banque Franco-Japonaise and the Nederlandsch-Indische Handelsbank.

Trade and Communication.—Exports for the Japanese empire in 1939 were 3,932,926,000 yen (an increase of 1,036,156,000 yen over 1938) and imports were 3,127,460,000 yen (an increase

291,232,000 yen over 1938). The excess of exports was 805,500 yen. It must be noted, however, that almost half of Japan's exports in 1939 (1,747,103,000 yen was the exact figure) went to yen-bloc countries, to Manchoukuo, the Kwantung leased territory and occupied China. The imports from these countries amounted to the very much smaller figure of 682,973,000 yen. Japan's trade with countries outside the yen bloc was therefore favourable by 258,664,000 yen. This result, however, was more favourable than that of 1938, when the unfavourable balance of trade with countries outside the yen bloc was over 550,000,000 yen. Japan's unfavourable balance of trade in 1939 could probably have been largely covered by the annual output of gold within the empire. During the first seven months of 1940 Japan's exports were 1,675,453,000 yen, as against imports of 1,588,862,000 yen. There were 15,254 mi. of government and private railways in Japan proper in 1937, besides 3,129 mi. in Chosen, 935 mi. in Formosa, and 300 mi. in South Sakhalin. The total number of registered ships in the Japanese empire on Sept. 30, 1938, was 4,842, with a gross tonnage of 5,339,632. The number of sailing ships was 17,791, the tonnage 1,046,476. Japan had 235 commercial aeroplanes on Oct. 1, 1935. Since that time secrecy has been observed about the number of aeroplanes, commercial as well as military. There has, however, been a visible expansion of the Japanese network of air communications in recent years. New air routes have been established between the larger cities of occupied China, such as Peiping, Tientsin, Shanghai, Nanking and Tsingtao. Another line connects Japan with Bangkok, capital of Thailand (Siam). Both Japan proper and Manchoukuo are served by numerous air routes and air lines are in operation between Japan and Formosa and between Japan and Palau, chief administrative centre of the mandated South Sea islands. The Japan Airways Company has a monopoly of commercial aviation. It was established in 1939 with a capitalization of 100,000,000 yen. The length of routes in 1938-39 was 15,335 km. The number of flights was 144, the aggregate length of flights 6,209,873 km., the number of passengers carried 69,268, the quantity of goods conveyed 7,807 kg., the amount of mail 819,261 kg. These figures show a very substantial expansion of Japanese civil aviation during the last few years. There were 11,784 telegraph offices and 12,484 post offices in Japan proper on Sept. 30, 1938. On March 31, 1938 there were 425,752 km. of telegraph lines in Japan proper, and the number of telegrams handled in 1937-38 was 72,629,960. There were 5,804 telephone exchanges in Japan proper on Sept. 30, 1938, and the number of subscribers was 981,920.

Agriculture, Manufactures, Mineral Production.—There were 5,574,879 farm households in Japan in 1937. Over the last few years this figure has shown a slight but constant tendency to increase, partly perhaps because of the drawing of farmers into munitions industries. Japan's most important crop is rice, with the breeding of silkworms as a secondary source of income. The rice crop for 1940 was estimated in November at 60,470,000 koku (1 koku being equivalent to 4.96 bu.). This represents a substantial decline from the 1939 crop, which was 68,964,468 koku and was a result of lack of sufficient rainfall and the prevalence of insect pests in some regions of the country.

Industry, when full industrial statistics were available, gave employment to about 6,000,000 people in Japan. About half of these were employed in tiny cottage workshops employing less than five persons. These hand industries, where wages are very low, are an important factor in Japanese economy. The prolonged war with China has affected Japan's industrial set-up, bringing more labourers into munitions and shipbuilding plants and causing depression in some industries which are unable to obtain normal supplies of raw material. The textile industry is Japan's largest; in 1937 it employed 1,094,583 workers, of whom a large

number were girls from the country districts. Japan in 1937 was the world's leading exporter of cotton cloth, exports amounting to 2,644,028,000 sq.yd., with a value of 573,065,000 yen. There was a decline in 1938, the figures being respectively 2,180,810,000 sq.yd. and 404,240,000 yen; and it is at about this level that the textile export industry has been maintained since that time. Before the beginning of the war Japan was the world's leading producer of rayon and ranked fourth among the producers of chemicals.

The general effect of the war has been to stimulate heavy industry and to restrict production of consumers' goods industries which are regarded as comparatively unessential and are denied adequate supplies of imported raw material under the present system of strict control of imports and foreign exchange. While many statistics are withheld on the ground of war secrecy the *Oriental Economist*, leading Japanese economic publication, continued to publish a seasonally adjusted index of industrial production, which gives the following picture of industrial output (monthly average, 1931-33=100):

General index		Consumers' goods	Producers' goods
1936	148.8	125.3	171.5
1937	167.3	136.5	197.9
1938	173.0	125.1	220.4
1939	180.8	121.4	239.7
1939 (June)	179.9	119.3	240.0
1940 (June)	173.4	102.8	244.3

This would convey the impression that Japan's industrial capacity is almost extended to the limit at the present time. Japan's chief mineral products are coal (41,803,000 tons, produced, with a value of 305,537,000 yen), gold (22,235 kg., with a value of 74,828,000 yen), copper (77,973,000 kg., value 66,617,000 yen). These figures are all of 1936, since which time statistics of mineral production have not been published. There is little doubt that there has been some increase of output under the stress of war exigencies. For additional statistics of production see ALUMINIUM; COAL INDUSTRY; CHROMITE; COPPER; FISHERIES; GOLD; IRON AND STEEL; MAGNESIUM; RAYON; RICE; SILVER; TOBACCO. (See also ARMIES OF THE WORLD; COMMUNISM; CHINESE-JAPANESE WAR; FASCISM; UNITED STATES.)

Jarvis Island: see SOUTH SEA AND EQUATORIAL ISLANDS.

Java, fourth in size but first in population and resources among the islands of the Dutch East Indies archipelago, is the most densely populated land in the world, with 821 inhabitants to the square mile. It is separated from Sumatra to the west by Sunda strait and from Bali to the east by Bali strait. Java and the adjacent small island of Madura (the two are treated as an administrative unit) had more than two-thirds of the population of the Dutch East Indies in 1930, with 41,719,524 inhabitants, mostly Malays who profess the Mohammedan faith. The world economic crisis of 1929-33, when the quantity of Dutch East Indian exports declined by 17% and the value by 67%, together with world-wide protectionist tendencies in relation to sugar, Java's most valuable crop, caused some important readjustments in the economy of the island. The government endeavoured to promote emigration to the neighbouring island of Sumatra, which is not so thickly populated. There was also an attempt to create an industrial base in Java. Among the industrial plants which were in 1940 under construction in the area

between Surabaya and Rambang were glass, chemical and spinning enterprises, weaving mills, hydroelectric stations, a scrap iron smelting plant, a blast furnace and rolling mill and a margarine and edible fats factory. An element of political tension was introduced into the life of the island by the German occupation of the Netherlands and the Japanese southward expansion into Indo-China. Java is a key point in the defence system of the archipelago and its military forces were estimated to have been doubled while an important naval and air base grew up at Surabaya and underground shelters were created all over the island for the eventuality of air raids. Submarines and torpedo boats and flying boats played a leading part in the island's preparations for defence.

Jewish Religious Life. Judaism in 1940 was dominated by Hitler's intention of creating a Europe without Jews. In Germany, where one-quarter of all Jewish deaths are suicides, 463 synagogues have been destroyed. In France the 250,000 Jews, largely refugees, were so broken that in all Paris there was in 1940 only one small chapel open for services. The German occupation of Luxembourg (3,000), Belgium (60,000), Holland (160,000), Denmark (6,000) and Norway (1,500), boded doom for Jewish life. In Bohemia-Moravia-Slovakia (350,000), Jewish books were burned and in Prague, characteristically, the historic statue of Moses was melted down. Judaism in the new pawns of the nazis, Hungary (450,000) and Rumania (900,000), faced sheer catastrophe. Only Portugal (1,200), Great Britain (300,000), Sweden (7,200), Switzerland (18,000), Yugoslavia (70,000), Bulgaria (50,000), Greece (100,000) and Turkey (80,000) continued to show a liberal attitude towards Jews and Judaism.

The one and a half million Jews in German occupied Poland were in 1940 passing through "probably the greatest tragedy in the entire history of Israel." Nazi policy called for their extermination by expulsion, walling them into ghettos, starvation, massacre and atrocities of which the world has heard very little. Hundreds of synagogues have been burned, sometimes the Jews themselves being compelled to fire their own synagogues and then being fined for damaging property.

Left wing Russia continued its anti-God campaign with disastrous results for Judaism among the Jews of Russian Poland (1,500,000), Bessarabia (250,000), Bukovina (50,000), Latvia (93,000), Estonia (4,500) and Lithuania (170,000), which have fallen into its power. The loss for religion was sharpest in Lithuania which became the centre of refuge for Jewish religious piety and scholarship exiled from Poland.

In Spain (4,000), Jewish marriage or burial has been forbidden, circumcision outlawed and Jewish children can be registered at birth only through baptism and can receive an education only through Catholic schools. The solitary synagogue in Barcelona has been closed, the Jewish cemetery demolished and a Jew who died was ordered buried in the dogs' graveyard.

In this world scene of Stygian darkness the only bright spots for Judaism were in the democracies. In Great Britain Judaism remained free through all war's handicaps and physical losses of synagogues and community buildings blasted through bombings from the air. Throughout the British empire and in the United States a growth of interest in the synagogue was noticeable, while Jews and Christians drew closer together by a recognition that their sacred traditions were alike facing a threat of destruction from a common enemy. The necessity of peace, liberty and democracy if religion is to survive became the main theme of every

rabbinical and synagogal convention and of every synagogue pulpit. In a word, how far Judaism, and therefore eventual Christianity, will survive at the moment seemed in 1940 to depend on how far the free democracies will succeed in repelling the totalitarian attack. (See also ANTI-SEMITISM.)

Jewish Welfare Board.

The Jewish Welfare board is a national organization which was founded on April 9, 1917, two days after the United States entered the World War, to serve the religious and welfare needs of men of the Jewish faith in the military forces of the United States. This work has been continued in peace time and has been expanded to provide service to disabled veterans, members of the Citizens Military Training camps and of the Civilian Conservation corps. This work is being expanded in view of the increase in military and naval forces in the current emergency.

The Jewish Welfare board is also the national parent organization of Young Men's Hebrew associations, Young Women's Hebrew associations and Jewish community centres, of which there are 325 in the United States and Canada, with a membership of approximately 400,000 men, women, young people, boys and girls. These organizations own 238 buildings which are used as community centres. The local centres conduct a varied program of recreational, cultural, civic and social activities.

The board has a department of vocational guidance for young people and has also made provision for the social and cultural adjustment of refugees through local centres. The board fosters regional federations of centres which promote inter-centre relations and activities and co-operate actively with the national organization. Regional organizations operate in New England, New York state, New York metropolitan area, New Jersey, Pennsylvania and Middle Atlantic states, in the Mid-West, and on the Pacific coast. The board co-operates with the National Association of Jewish Center Workers, composed of professional workers in the Jewish centre field, whose annual meeting was held in Pittsburgh, Pa., May 21-26, 1940. The annual meeting of the Jewish Welfare board was held in New York city Saturday evening, April 13, and Sunday, April 14, 1940. Frank L. Weil is president of the Jewish Welfare board, and Louis Kraft is executive director. The offices of the Jewish Welfare board are located at 230 Fifth avenue, New York city. (F. L. W.)

Jews, Distribution of.

In view of the fact that in several of the countries where the large numbers of Jews were living in 1940 the census does not contain any questions regarding religion, that in other countries, especially in Asia, no exact census exists, the exact number of Jews in the world in 1940 cannot be ascertained. The definition of persons falling under the classification of "Jewish race" is in no way agreed upon. Several fascist countries in Europe which have introduced discriminatory legislation against the "Jewish race" have defined that term in different ways. In countries where the census includes questions of religious allegiance, even this religious criterion of Jewish faith is difficult to define exactly. The estimates which generally vary around the figure of 16,000,000 for the Jews cannot claim any foundation on exact figures.

To this uncertainty about the number of Jews in the world was added in recent years a growing uncertainty about their numerical distribution in the different countries and continents. Events since 1933 have led partly to a decrease in the number of Jews as a result of a conscious policy aimed at their extermination, partly to a great shift in their distribution all over the world as the result of large enforced migratory movements. The national

alist legislation in Germany was introduced to a varying degree by conquest into Austria, Czechoslovakia, Poland, Norway, Netherlands, Belgium and France, and was imitated in fascist countries like Italy, Hungary and Rumania.

Before the outbreak of the war, Poland was the country in Europe with the largest Jewish population, estimated at about 5,000. Of this number probably more than 500,000 perished, results of the war, mass persecution and starvation. Of the remainder, about half came under the domination of Germany; the other half under the domination of the soviet union, which estimated in 1940 probably more than 4,000,000 Jews, and had the largest Jewish population in Europe, surpassed only by the United States of America, where the number of Jews could be estimated at more than 4,500,000. From most central European countries Jews have emigrated during the last years to western Europe, the United States, Latin American countries, Palestine and the far East. Frequently they had to resume their migration after a short period, so that the distribution of Jews was in these last years in a state of permanent fluctuation. Thus many German Jews who in the years of 1933-38 settled in Italy and were welcomed there, had to leave the country after the introduction of the national socialist racial theory by the Italian government, and many Polish Jews had to follow. Central European Jews who had settled in France, the Netherlands or Belgium in the years between 1933 and 1939 found themselves in 1940 forced to emigrate. The outbreak of the war and the disruption of means of communication, on the other hand, made large migratory movements difficult and almost impossible. But in any case the movement of Jews and of shift in the distribution of the Jewish population of the earth has not yet come to its end. (See also ANTI-SEMITISM; REFUGEES.) (H. Ko.)

Jitterbug: see DANCE.

Johns Hopkins University, Baltimore, Md.; president, Isaiah Bowman, Ph.D. Enrolment for 1940 in the several schools of the university was as follows: school of higher studies of the faculty of philosophy, 276; engineering, 387 (including 55 graduate students); arts and sciences, 396; business economics, 87; medicine, 297; hygiene and public health, 150. Enrolment in the afternoon and evening courses was 3,222 and in the summer school, 908. At the end of the fiscal year the endowment of the university was valued at \$30,354,242.54 and income from all sources for the year was \$32,622.97. The following appointments to the faculty of philosophy were announced during the year: Dr. Benjamin Harrison Willier became Henry Walters professor of zoology; Dr. Pedro Salinas, professor of Spanish literature; Dr. Henry T. Lovell, professor of Latin; Dr. Charles A. Beard, professor of American history for the year 1940-41. Construction was begun on the new biological laboratory as a memorial to the late Ottmar Argenthaler, inventor of the linotype. Funds for the building were bequeathed to the university by his son, Eugene G. Mergenthaler.

Jones, Jesse Holman (1874-), U.S. secretary of commerce. was born in Robertson county, Tenn. on April 5. At Dallas, Tex., in 1895 he became manager of a lumber company and seven years later organized his own firm. In 1909 he established the Texas Trust company of Houston, later the Bankers Mortgage company. He also engaged in extensive real estate operations and bought control of the *Houston Chronicle*, of which he is publisher. President Hoover appointed him a director of the Reconstruction Finance corporation in 1932 and he became chairman the following year. In

July 1939, pursuant to the regrouping of governmental agencies under the president's reorganization plan, Jones was appointed administrator of the Federal Loan agency. On Sept. 13, 1940 President Roosevelt nominated him secretary of commerce to succeed Harry L. Hopkins, after congress had enacted a special law permitting him to retain the office of federal loan administrator. The senate confirmed this nomination the next day and he was sworn in Sept. 19. On Dec. 4 Jones stated his belief that Great Britain was a "good risk" for a war loan from the United States.

Jute. The area planted to jute in India in 1940 exceeded all previous years, 4,112,750 ac., or 951,850 ac. more than in 1939. Most of the increase was in Bengal, where the acreage was 3,454,450, or 904,850 more than in 1939. The previous high acreage in India was 3,600,000 in 1927. In contrast with this expanded acreage was the reduction in jute mill operations in 1940, the tardiness of deliveries because of a shortage of ocean shipping, declining demand and prices during the latter part of 1940 substantially lower than in 1939. On Aug. 19 the Indian jute mills association reduced working hours from 54 to 45 a week. Later, operations were suspended a part of each month in an effort to regulate output and maintain prices. With the surrender of France in the summer of 1940 India lost a large part of its market for jute. Although in March the British government ordered 52,000,000 yd. of jute for sand bags, there was a decline in this wartime demand for jute at a time when it was estimated that one-sixth of the looms in the Indian jute mills association were making sand bags. Dundee, Scotland (the United Kingdom centre of jute manufacturing) also reduced operations. Since the beginning of the war in Europe the United States has become India's third largest customer for exports, one-half the value of those exports being represented by jute imported into the United States for potato and other burlap bags. Indian jute, however, has felt increasing competition from the growing use of cotton bagging in the United States because of the cotton surplus in that country. (S. O. R.)

Juvenile Delinquency. According to reports from the Federal Children's bureau, juvenile court statistics are received on a state-wide basis from eight states, and from 34 courts in 20 additional states, and from the juvenile court of the District of Columbia. In the year 1940 reports were available concerning the number of cases disposed of in 461 courts representing approximately 38% of the population of the United States. In 1939, 83,628 cases were disposed of by juvenile court methods as compared with 74,972 the previous year. White children represented 79%, Negro children 21%, making a 5% decrease in delinquency for Negro children. Children of other races accounted for less than 1%.

There was an increasing tendency to extend juvenile court methods to cover a larger proportion of child offenders. Yet, it is to be noted that police and adult courts handled large numbers of youthful offenders in the United States. Youths less than 21 years of age constituted some 20% of all persons arrested, including almost 13% of the murderers and 53% of the automobile thieves.

An analysis of 104,000 cases of larceny investigated by the federal bureau of intelligence shows that 64.9% of the property

involved was between \$5 and \$50 in value. These petty offences were committed by young persons. Reduction in juvenile delinquency was noted in communities which have established child guidance clinics, and the increased use of parks, school playgrounds and swimming pools for children, supported by public recreation centres.

New York city reported a decided decrease in the number of youthful offenders arrested.

Michigan during 1940 extended the use of the Michigan Child Guidance institute, examining more than 500 children, and working out a new technique for relating clinical services through the co-operation of community agencies. The juvenile court of the District of Columbia extended its work and established a new court building in Washington.

Kalliö, Kjösti (1873–1940), ex-president of Finland, died in Helsinki Dec. 19, as he was about to take a train for home after seeing the election of his successor, Risto Ryti. For a biographical sketch see *Encyclopædia Britannica*, vol. 13, p. 246.

Kamerouns: see BRITISH WEST AFRICA; FRENCH COLONIAL EMPIRE.

Kansas, a central state of the United States admitted Jan. 29, 1861, popularly known as the "Sunflower state"; area, 81,774 sq.mi.; population according to the U.S. census of 1940, 1,801,028, a decrease of 79,971 or 4.3% from 1930. In rank this placed the state in 29th place in comparison with 24th in 1930. The state weathered the depression-drought decade (1930–40) with the highest degree of population stability in its history. The net loss in population was not the result of an abnormal or even of a higher rate of emigration than usual from the state, but was the outcome of a sharp decline in replacement immigration entering the state.

Capital, Topeka (U.S. census 1940), 67,833, an increase of 5.8% over 1930. Topeka was the third city in size, the largest being Kansas City, 121,458, a decrease of 0.3% in 1940 from 1930 and Wichita, 114,966, an increase of 3.5% during the decade. Of the state's population (1940) 753,941 were urban or 41.9%. In 1930 63,344 were Negro; 1,723,131 were native-born white and 69,716 were foreign-born.

History.—In the biennial election of 1940 all executive officers, Republicans, were re-elected, together with a Republican legislature: Payne H. Ratner, governor; Carl E. Friend, lieutenant governor; Frank J. Ryan, secretary of state; George Robb, auditor; Walter E. Wilson, treasurer; Jay S. Parker, attorney-general; George L. McClenny, superintendent of public instruction; Charles F. Hobbs, commissioner of insurance; William C. Austin, state printer. On the presidential ticket, Wendell L. Willkie (Rep.) received 489,160 votes, Roosevelt (Dem.) 364,725. Governor Ratner received a majority of only 430 votes. The governorship was decided by outstate absentee ballots and the defeated candidate, William H. Burke, unsuccessfully challenged the constitutionality of the outstate voting law. The legislature of 1941 was expected to enact a civil service law in accordance with a constitutional amendment adopted at the election of 1940. Other major legislative measures are the tax and school codes prepared for consideration of the legislature in furtherance of the codification program.

Education.—The State had in 1940 more than 200 public libraries, of which more than half were tax supported. There were 15 public and six private junior colleges, 15 private four-year col-

leges, one municipal, and five state-supported institutions, collegiate grade. For the school year 1936–37, the last for which data are available, there were 6,636 one-teacher district schools in operation with an enrolment in the eight elementary grades, 83,100. There were 985 two or more teacher districts (excluding cities of first and second class) with enrolments in the elementary grades of 83,769. The 88 cities of first and second classes had elementary enrolments of 119,980.

Agriculture, Manufactures, Mineral Production.—According to the federal-state estimates of Dec. 1940, the year's field crop production was the best in eight years, 30% above 1939 and 9% of the ten-year (1926–35) average. In value it was estimated 22% above 1939. In spite of the record low of 35% of normal condition in Dec. 1939, the winter wheat crop yielded 123,848,000 bu. as against 111,657,000 bu. in 1939 and a ten-year average (1929–38) of 135,972,000. The harvested acreage was 8,857,900 ac., the smallest since 1935 and abandonment of planted wheat acreage was 29% or slightly less than in 1939. Corn production from 2,647,000 ac. was 41,028,000 bu., as against 37,220,000 in 1939 and the ten-year average of 67,786,000. Production of other crops was similarly better than in 1939. Winter wheat planting in the fall of 1940 was 12,996,000 ac. as against 12,913,000 for 1939, which was reported by the U.S. department of agriculture as of Dec. 1 at 88% of normal condition and the highest since 1930. In mineral production during 1939, Kansas ranked third among the states in zinc, sixth in lead, tenth in copper, fifth in salt, fifth in natural gas and sixth in petroleum. The state industrial commission achieved little in tangible results for the year. Except for the building of aeroplanes at Wichita the state shared little in the armament program during 1940.

(J. C. MN.)

Kantorowicz, Hermann (1877–1940), German scholar, was born in Posnan, Poland, Nov. 18. He was educated at the universities of Berlin, Geneva, Heidelberg and Munich and was a member of the faculty of the University of Freiburg from 1908 to 1913. He served in the German army throughout the World War of 1914–18. He became professor of jurisprudence and criminal law at the University of Kiel in 1929 but was dismissed in 1933 and went to the United States. He had written much on the causes of the war and had asserted that German belief in the "myth" that England was encircling the empire was the basic cause. In the United States where he remained a year, he lectured at Columbia university, the College of the City of New York and the University in Berlin, in the New School of Social Research. He joined the faculty of the School of Economics in London in 1934 and in 1937 was appointed assistant director of research in law at Cambridge university, later becoming director. He died in Cambridge, Feb. 22.

Kazakh S. S. R.: see UNION OF SOVIET SOCIALIST REPUBLICS

Keitel, Wilhelm (1882–), German soldier, born Sept. 22, was a commander of artillery during the World War of 1914–18. On April 1, 1934, he was promoted to major general and the following year, when Germany introduced conscription, he took charge of the personnel section (*Wehrmachtsamt*) in the war ministry, and was thus connected to a certain extent with the re-occupation of the Rhineland in 1936, and with the dispatch of German reinforcements to Nationalist Spain. In Feb. 1938, during Hitler's "army purge" of Gen. von Blomberg and other conservative members of the high command, Gen. Keitel was appointed chief of the supreme command of the German armed forces. He thus directed operations against Poland, Norway, the Netherlands, Belgium, France and Britain in 1939.

1940. On June 22, 1940 he signed the German-French armistice and on July 19 he was created field marshal by Adolf Hitler. During the fall of the year he accompanied Hitler on his various trips to Mussolini, Franco, Pétain and Laval. His meeting with an Chief of Staff Badoglio at Innsbruck Nov. 15 led to reports that he might assume command of the axis forces in Africa, these rumours were denied.

Kentucky, an east south central state of the United States, admitted June 1, 1792, popularly known as the "Blue Grass State," area 40,598 sq.mi.; population (U.S. census, 1940) 2,845,627, an increase of 231,038 or 8.8% over that of 1930. Capital, Frankfort, 11,492; largest city, Louisville, 319,000. Other cities include Covington, 62,018; and Lexington, 49,000. Of the state's population, urban residents numbered 849,327; rural residents numbered 1,996,300. On April 1, 1940 there were 731,189 dwelling units, of which 30,297 were reported vacant. Of the state's 120 counties, 105 gained in population during the decade. Among these, Jackson county gained 56%. Shelbyville grew most rapidly among the cities, gaining 32%.

History.—In the national election Nov. 5, 1940, Roosevelt (Dem.) electors carried the state by 557,222 votes to 410,384 for the Republicans. The Socialist vote was 1,014; the Prohibitionist, 1,440; there was no communist ticket. Senator A. B. Chandler (Dem.) defeated W. B. Smith (Rep.) by 561,151 votes to 401,812, for the U.S. senate. A Republican, John M. Robison, was elected in the 9th district—eight other districts electing congressmen to Congress. The general assembly of 1940 approved a legislative program which supplemented and co-ordinated many social objectives, such as housing projects, rural credits and conservation plans, adjusting them to local conditions. The first conservation district to stop erosion and retire marginal lands from cultivation was created in Logan county. Other commissions were appointed to investigate farm tenancy; supervise distributions of surplus U.S. food commodities; certify WPA workers and CCC boys to their respective officers. Considerations of public health and safety doubtless required the passage of laws which prohibits ophiolatrous practices in any religious service or gathering.

Education.—The per capita distribution of the common school fund, designed to assist the poorer districts, was \$12.33, the highest ever made. A constitutional amendment is proposed for Nov. 1941, to apply 10% of this fund to the most needy areas, regardless of regular enumeration. The school census of 1940 was 1,429 pupils.

Consolidation of small high schools continued in various counties where a full program was not feasible. Under a new law, school buses must transport pupils of private as well as public schools. The Teachers' Retirement Fund law of 1938 was amended with \$500,000, beginning Jan. 1, 1941, and only 15 of the 18,830 teachers declined to participate in the plan.

Charities and Correction.—Governor Johnson Dec. 11 appointed W. A. Frost, former chairman of the board of parole, as commissioner of public welfare, replacing Miss Woll, resigned. The state deferred the payment of benefits to 3,628 needy blind, pending a court decision. At Ashland was established a new mental hospital.

Health and Welfare.—The death rate was 10.4 per 1,000 population in 1939, compared with 9.9 in 1938. After Jan. 1, 1941, birth certificates were required of all applicants for marriage licenses. Prominent leaders who died during the year were C. W. Beckham, ex-governor and Maurice L. Galvin, Republican lawyer. Mammoth cave will become a national park by Jan. 1, 1941.

Finance.—In the fiscal year which closed June 30, 1940, the

receipts in the general fund were \$26,974,424; expenditures \$25,858,668, excluding highway and other special accounts, such as bridges. Two interstate bridges, at Ashland and Henderson, will be toll-free early in 1941. The state treasury debt fell from \$6,953,703 to a minimum of \$4,097,000 Dec. 31, 1940—smallest in 26 years. County finances, however, failed to improve during the year, due to former issues of county bonds for schools, roads, and public works. Perry county filed suit in bankruptcy under the national law, and 25 other counties defaulted principal sums or interest. To assist such, and restore public credit, a state local finance officer supervised all new bond operations through the department of revenue. The corporation income tax yielded \$1,945,205; personal incomes, \$2,351,257; inheritances and estates \$1,200,107 in the latest fiscal year.

Agriculture and Manufactures.—Tobacco, the chief crop, yielded in 1940 295,890,000 lb., being somewhat smaller than that of 1939—342,100,000 lb. A total amount of 295,419,000 lb. was sold on 22 state floors at an average of 17.73 cents per lb. in the 1939-40 season. Of the other crops of 1940, corn yielded 70,400,000 bu.; wheat 5,625,000 bu.; oats 1,260,000 bu.; Irish potatoes 4,140,000 bu., and sweet potatoes half that amount. The fruit crop was negligible commercially. In October, 39 distilleries were in operation, and Kentucky stood first among the states in the production of whisky. Price advances were hastened by increased taxes from \$1.04 to \$1.20 a gallon, as well as by the Fair Trade state law. In rural electric service Kentucky declined from 39th to 41st place among the states.

The production of coal in 1939 was 42,310,995 tons, mined by 54,693 men. Fatal accidents numbered 139, an increase of 41 over 1938. Of these, 28 fatalities occurred in one mine. Petroleum amounted to 5,518,449 barrels. There are no accurate data for the yield of natural gas.

Kidnapping. During 1940, kidnappings in the United States dropped to the lowest level recorded since 1932. Of the 12 cases reported, only one was featured by a demand for ransom, as contrasted with ten such demands in 1933. Kidnappings jointly investigated by the federal bureau of investigation and local police authorities under the terms of the Federal Kidnapping act of 1932 are shown in Table I.

Table I.—Kidnappings Investigated in U.S., 1932-40

Year	Total Number of Kidnappings	Number Wherein Ransom Demanded
1932 (from June 22)	5	5
1933	14	10
1934	18	5
1935	26	1
1936	31	1
1937	20	4
1938	37	5
1939	20	0
1940	12	1

All but two of the 194 cases arising during the period 1932-40 were solved. There were 378 convictions in federal and state courts, with 12 death sentences, 43 for life imprisonment and the balance for varying terms with a total of 4,368 years, 7 months and 13 days. Eight kidnappers committed suicide, eight were killed while resisting arrest, seven died by murder at the hands of their confederates in crime and two were lynched. On Dec. 31, 1940, 20 persons were under indictment for violations of the federal act. Some of these were already serving sentences

for other crimes. The work of the federal bureau of investigation in this difficult field continued to elicit enthusiastic popular approval.

Outstanding case of the year was that of three-year-old Marc L. M. E. de Tristan, who was kidnapped from the custody of his nurse in Hillsboro, Calif., on Sept. 20, 1940. A note demanding \$100,000 ransom was left behind. The kidnapper was later seized in El Dorado county, Calif., by two lumbermen acting on the basis of published descriptions. The boy was returned to his home, unharmed, on Sept. 22, 1940. W. J. Muhlenbroich, a German alien with 24 aliases, confessed the crime, was indicted, pleaded guilty and on Oct. 4, 1940 was sentenced to life imprisonment in the state penitentiary.

A reported link between this case and the Mattson kidnapping of several years ago was shown to have no factual basis.

Official reports of kidnapping in England are confined to stealing children under 14 years of age. The record since 1900, summarized to the latest date for which official reports are available, appears in Table II.

Table II.—Record of Kidnappings in England since 1900

Five Year Averages		Annual Totals	
1900-1904	15	1935	4
1905-1909	10	1936	3
1910-1914	7	1937	7
1915-1919	8	1938	5
1920-1924	4		
1925-1929	4		
1930-1934	5		

There were three kidnappings in Shanghai between Oct. 10 and Nov. 29. R. Bullen, Sr., was held by robbers in Jerusalem on Oct. 14, but was later released unharmed. Similarly, J. W. Reid was taken by bandits in Mexico City on Oct. 27, only to be released on the following day. On Nov. 1, 1940, I. Haugen, a Norwegian resident of Brooklyn, N.Y., charged that he had been kidnapped and robbed by persons whom he described as "pro-nazis."

Special interest attached to the support extended by U.S. Attorney General Robert H. Jackson to a proposed statute that would authorize police to have recourse to wire tapping in kidnapping investigations. (See also FEDERAL BUREAU OF INVESTIGATION.)

Kiwanis International. Kiwanis International is composed of 2,146 clubs and 110,000 members located in communities throughout the United States and Canada. The first United States club was organized in Detroit in 1915. In Canada the first club was built in Hamilton, Ontario, Nov. 1916. A club is composed of two representatives from each business, professional and agricultural classification. These men are brought together to render civic and social service to their communities and to aid in the solution of community, state, national and international problems.

International headquarters: 520 North Michigan avenue, Chicago. President, Mark A. Smith, Thomaston, Ga.; acting secretary, George W. Kimball, Chicago.

Knights of Columbus. Founded in 1882, in New Haven, Conn., by the Rev. Michael J. McGivney and a small group of Catholic men, this order has become one of the most numerous and powerful Catholic societies of laymen in the United States. It is dedicated to the defence

and preservation of Catholic principles.

The 58th annual supreme council convention was held Indianapolis, Ind., Aug. 20-24, 1940. Attending the convention were 265 officers, and delegates from 60 state councils of North America. They represented 2,475 local councils, with a total membership of 412,010, scattered through 48 states, the American possessions, 9 Canadian provinces and Spanish America. Insurance members numbered 217,570, with more than \$255,000,000 of protection in force. During 1940, about \$2,751,000 were paid in death benefits, and \$438,000 in old age benefits.

The program of activities stressed religious, patriotic and insurance projects. Through resolutions at the annual convention the order tendered to the government and to the Catholic bishop services and assistance toward the welfare of the military and naval forces in the defence program. The Canadian councils collected nearly \$500,000 for military and naval welfare work.

Increased activities were undertaken in sponsoring Catholic radio programs, stimulating study clubs and forums, co-operating with the Legion of Decency in motion pictures and decency literature campaigns, combating subversive groups, promoting religious observances and services.

The supreme council officers in 1940 included: supreme knight Francis P. Matthews, Omaha, Neb.; deputy supreme knight John E. Swift, Mass.; supreme secretary, Joseph F. Lamb, N.Y.; supreme treasurer, Daniel J. Callaghan, D.C. Headquarters of the supreme council are at New Haven, Conn.

The official organs are the monthly, *Columbia*, the *New York Weekly* and the monthly of the Boy Life Bureau, the *Columbia Squires Herald*. (F. X. T.)

Knopf, S. Adolphus (1857-1940), U.S. physician, born in Halle-on-the-Saale, Germany, Nov. 27, and was educated at the University of Paris and Bellevue hospital medical college in New York city. Upon arrival in the United States he taught languages in California, then went to New York city in 1886 to study medicine. After practising for a while in Los Angeles, he continued his medical studies in Paris, and then settled permanently in New York city in 1896. From 1908 to 1920 he was professor of phthisiotherapy at the New York Postgraduate medical school and hospital. He was the founder of the New York city and the National Tuberculosis associations and was one of the most active men of his profession in combating the disease. He died in New York city, July 15.

Knox, (William) Franklin (1874-), U.S. publisher, statesman and soldier, became known in 1940 as a pre-eminent apostle of U.S. preparedness and U.S. assistance to Great Britain in the prosecution of the war. After his appointment June 20, 1940 as secretary of the navy, Knox became an outspoken opponent of appeasement and declared in a speech at Boston on Nov. 14 that Hitler was fanatic, greedy for domination of the world. In this address he said that the United States would not "appease anybody on earth." On Dec. 20 Knox was appointed to the four-man Office of Production Management, the "super-defence council" headed by William S. Knudsen.

Born Jan. 1 at Boston and educated at Alma (Mich.) college. Col. Knox joined Theodore Roosevelt's Rough Riders, with which he served from April to Sept. 1898. Commissioned a major in 1917, he was in France from May 1918 to Feb. 1919 and became colonel in the 365th field artillery. His newspaper career began shortly after his service in the Spanish-American war when he was successively reporter, city editor and circulation manager of the Grand Rapids, Mich., *Herald*. From 1901 to 1912 he was

sher of the Sault Ste. Marie, Mich., *News* and in 1913 he purchased control of the Manchester, N.H., *Union and Leader*. He became associated with the Hearst newspaper chain and its general manager until 1931, when he became publisher of the Chicago *Daily News*. In 1936 Col. Knox was the Republican candidate for vice-president.

Knudsen, William Signius (1879–), U.S. industrialist who became in 1940 the leading personality in U.S. production for defence. He was born in Copenhagen, Denmark, on March 25 and as a youth worked in a bicycle shop in his native town. At the age of 20 he emigrated to the United States, where he found work in a shipyard in New York. After working in a railroad shop for a year and a half he moved to Buffalo, where he ultimately became superintendent of a factory. He then worked for Ford Motor company and became associated with Chevrolet Motor company, of which he was made president in 1922 and later president. From 1933 to 1937 he was executive vice-president of General Motors corporation, and in the latter year he became president. On May 28, 1940 President Roosevelt appointed him commissioner of industrial production for the new national defence advisory commission. In this position assumed increasing importance during the remainder of the year and although the commission had no chairmanship with authority until Dec. 20, Knudsen was recognized as its outstanding member. On Dec. 13, in an address in New York City, Knudsen stated frankly that the preparations for national defence were far behind schedule and blamed public lethargy for the situation. On Dec. 16 he called the attention of machine-tool manufacturers to the "terrible urgency of the situation." On Dec. 20 he was appointed chairman of the new Office of Production Management, a "super-council" of four men with the fullest authority for producing war materials, procuring the necessary supplies for production and determining priorities in many orders. The other members were secretaries Knox and Carson and Sidney Hillman (*qq.v.*).

Kneller, Walter Jodok (1875–1940), U.S. manufacturer, was born in Sheboygan, Wis., on March 3. He was educated in the public schools and at the age of 15 went to work in his father's plumbing supplies factory. When his father died in 1900 he and his brothers continued and expanded the business and built around it a model town which was named for their father. The Society of Arts and Sciences awarded him a medal in 1934 "for conspicuous service to humanity," in recognition of what he had done to benefit his employees. He was elected governor of Wisconsin in 1928 as a Republican after defeating the La Follette faction in the primary. He was defeated for renomination by Philip La Follette in 1930, but defeated the incumbent in the primaries of 1932, though he lost the election in the Roosevelt landslide of that year. He died in Kohler, April 21.

Konoye, Fumimaro (1891–), Japanese prince and statesman, was born at Kyoto in October 1891, son of Prince Atsumaro Konoye and descendant of one of the nation's oldest families. He graduated from Tokyo Imperial University's law college in 1917 and was a member of Prince Saionji's delegation to the Paris peace conference the following year. After serving in the house of peers he was prime minister in 1931–39 and subsequently minister of state without portfolio and president of the privy council. In 1940, after the resignation of Adm. Yonai (*q.v.*), he again became prime minister. Upon the installation of his cabinet in July 23 political observers predicted that his government would be decidedly toward fascism. On Aug. 1 the government an-

nounced that it would pursue a totalitarian policy which would include Japanese domination over Asia and on Aug. 15 the Minseitō party, largest in Japan, was dissolved. But shortly thereafter Konoye announced, after an audience with the emperor, that he did not propose to set up a single-party state because "the privilege of assisting the throne cannot be monopolized by a single individual or a single party."

Konoye's principal preoccupation in foreign matters, aside from the Chinese and French Indo-Chinese "incidents," was his nation's relations with the United States. The unexpectedly strong reaction of the U.S. to the Axis-Japanese pact of Sept. 27 caused Konoye and members of his government to assert their peaceful intentions toward the western hemisphere. (*See JAPAN.*)

Kubelik, Jan (1880–1940), Bohemian violinist, was born in Mielich near Prague, and died in Prague, Dec. 5. For a biographical sketch see *Encyclopædia Britannica*, vol. 13, p. 509.

Kuwait: *see* ARABIA.

Kyanite. Its adaptability for the production of special high temperature refractories has led to a gradual increase in the demand for kyanite, which has been supplied by production from North Carolina, South Carolina, Georgia, Virginia and California and by imports from India, where production amounted to 28,835 long tons in 1938. Imports into the United States were 3,881 short tons in 1939, all from India and production is estimated at 2,950 tons. The related minerals, sillimanite and andalusite, which have the same chemical composition as kyanite, but a different crystal structure, are also used for the same purpose. (G. A. Ro.)

Labour Party. At the British Labour party conference held in May 1940, the affiliated membership represented was 2,766,000 as compared with a total membership of 2,663,000 in 1939. Of the 1940 total, trade unions accounted for 2,224,000 and the individual membership of local labour parties for 487,000—this latter figure showing a substantial increase over the previous year. In consequence of the by-election truce the membership of the party in the house of commons remained unchanged in substance; but two members previously expelled from the party on account of their association with Sir Stafford Cripps's "Popular Front" campaign were readmitted to membership, while D. N. Pritt, K.C., was expelled on account of differences upon war policy. A former leader of the party, George Lansbury, died on May 7, 1940. As a pacifist, he had been out of harmony with the party's official policy for some time before his death; but all sections of the labour movement held him in high affection and respect, and his death removed nearly the last of the leaders who had been associated with the political labour movement from its very early days.

The Labour party gave from the outset its full support to the nation's war effort. But it remained technically in opposition in the house of commons until Winston Churchill succeeded Neville Chamberlain as prime minister in May 1940. On the reconstruction of the government, two members of the party entered the war cabinet, C. R. Attlee, the parliamentary leader, becoming lord privy seal, and Arthur Greenwood, the deputy leader, minister without portfolio in charge of certain important tasks of economic co-ordination. At the same time Herbert Morrison, previously leader of the London County council, became minister of supply; A. V. Alexander, the chief parliamentary representative of the co-operative movement, first lord of the admiralty; Hugh Dalton, minister of economic warfare; and Ernest Bevin, the secretary of the Transport and General Workers' union, minister of labour and national service. Other labour members entered the government in less important offices.

These changes necessitated a reconsideration of the party's work in the house of commons. It was decided to maintain a "shadow" opposition for the purpose of keeping up free discussion; and H. B. Lees Smith, a former postmaster general, was elected as acting leader of the party. In October, Ernest Bevin was added to the war cabinet, and Herbert Morrison was transferred from the ministry of supply to the home office.

After the collapse of France, the Labour party played a leading part in organizing a more intensive war effort to meet the emergency. Long hours had to be worked in the new factories in order to re-equip the army and speed up the output of aeroplanes and other munitions of war.

The local Labour parties worked in 1940 under great difficulties. Many of the party's best leaders and organizers were fully engaged in various forms of war work; and in municipal affairs many local councils had handed over their work largely to small emergency committees. Efforts were made to maintain party activity by special local and regional conferences and by other means; but the suspension of both national and local elections meant that many of the normal activities were no longer called for. In view of these conditions and of the extensive calling up of members for the armed forces, the maintenance of the party's individual membership indicated a substantial growth of its real influence.

(G. D. H. C.)

Labour Unions. The military defence program of the United States government dominated developments in the labour movement during 1940. The first and most potent effects of this program were a vast expansion in government appropriations and contracts for defence materials. As a result production increased rapidly in the defence and allied industries and a wave of re-employment got under way. By the last quarter of the year there were indications that the bulk of the employable unemployed of the country might easily be absorbed by industry in the course of 1941. This hope drastically changed the whole labour outlook. The chances for the further growth of trade unionism looked more promising than at any time since 1936-37. Wages and working conditions began to reflect the influence of more favourable conditions of business. The relations of the government to organized labour assumed the forms usually associated with times of national emergency or war.

The course which the government's policy toward organized labour would pursue was indicated by the appointment of Sidney Hillman, president of the Amalgamated Clothing Workers of America and vice-president of the C.I.O., as a member of the defence advisory commission—the federal agency charged with administering the defence program. Aside from his general functions as a member of the commission, there devolved upon Mr. Hillman the special tasks of securing to industry an adequate

supply of labour and preventing strikes or lock-outs. He associated with himself a joint trade union committee, composed of the presidents of leading unions affiliated with the C.I.O. and the A.F. of L., to advise with him concerning matters of defence labour policy. Mr. Hillman's appointment greatly enhanced the influence of union labour in United States industry and added to his prestige in the labour movement. Due to the variety of duties which it was called upon to assume, Mr. Hillman's office superseded many of the functions of the permanent department of the government, notably those of the department of labour. In Jan. 1941 the position of organized labour was further strengthened when the president, in setting up a supreme defence council, the office of production management, designated Mr. Hillman as its associate director.

In spite of improving business, strikes during 1940 were comparatively few and brief. The number of strikes, the number of workers involved and the number of days lost were the smallest in many years. Only during the last quarter of 1940 did strikes appreciably increase, but even then they were speedily settled. The quiet of this period was unexpected and was variously attributed to the effects of the National Labor Relations act, prompt and effective intervention in threatened disputes by agents of Mr. Hillman's office, and the broadened facilities of the conciliation service of the department of labour. However, public concern with the defence program and its opposition to delays or interruptions in production doubtless played a leading part in preserving the peace.

This decline in labour trouble did not prevent the development of serious issues of labour policy and industrial relations. The letting of vast government contracts for defence, estimated to reach some \$20,000,000,000, made the government virtually the largest employer of labour in the country. The unions, appreciating the significance of this new relation between government and industry, hoped to use it for their own advantage, persuading the government to deny contracts to firms refusing to recognize organized labour and to make agreements with it. In particular, the unions sought to employ this method to force leading nonunion firms, such as Bethlehem Steel and Ford, to sign contracts with the labour organizations claiming jurisdiction over their employees. As one of its earliest acts, the defence advisory commission advised government purchasing agencies that they should observe the labour laws of the country in awarding defence contracts. This action was generally interpreted to mean that firms found to be violating the federal labour law, especially the National Labor Relations act, would be denied government contracts. The announcement of this decision aroused widespread public discussion because many of the companies affected by it were among the most important suppliers of defence products and because of prevailing dissatisfaction with the ways in which the Labor Relations act was being administered. The questions thus raised were made the subject of hearings by a committee of the house of representatives which had been set up to investigate the Labor Relations act and its administration. At these hearings it was disclosed that there was no legal sanction for withholding orders from violators of the Labor Relations acts, and contracts, therefore, continued to be awarded to companies able to meet the requisite specifications. Pressure by the unions, however, was not abated and it was expected that this question would become one of the most controversial issues of the next years.

At the same time organized labour utilized its forces in other directions to extend the boundaries of its jurisdiction and to increase its membership. With increasing production and expanding employment, the unions began to make demands for higher wages, better working conditions and concessions, such

ie closed shop and check-off, aimed to strengthen their holds
their members. Successful drives for higher wages in the
defence industry of aeroplane production and in the machine-
industry, which was expanding its capacity many times over
asons of defence business, resulted in the unionization of
y industries and a considerable growth in membership. Wages
ned their upward course, which was interrupted by the de-
sion of 1938, and stood by the end of 1940 at their highest
t for all time.

od business, combined with favourable political conditions,
er raised union membership during the year. While it is
difficult to obtain accurate records of membership, it may be
ated that the aggregate membership of all components of
United States labour movement was approaching 8,000,000
le last months of 1940. This figure exceeds the previous
of 1920 by close to 3,000,000. Many political factors con-
ted to these gains. The National Labor Relations board
nued to rule in favour of the unions and thereby brought
hitherto nonunion firms under union contracts. Strong
ts to amend the National Labor Relations act were defeated
he opposition of the administration, and the powers of the
r Relations board remained uncurbed. The United States
eme court, reconstructed through the new appointments made
President Roosevelt, consistently sustained the decisions of
board. Thus in the famous Republic Steel case the supreme
t upheld the board's decision ordering the Republic Steel
pany to reinstate some 5,000 former employees discharged
ng the strike of 1937. This verdict did much to pave the
for the unionization of that part of the steel industry which
still unorganized. As in former years, the representatives of
ral mediation agencies used their influence and prestige to
itate union recognition, and the new defence agencies, deal-
with labour disputes, began in the course of 1940 to accom-
the same purpose. The almost unanimous support by
nized labour of President Roosevelt's candidacy for a third
made the results of the November election of great im-
ance to the labour movement. For the re-election of the
dent was, under the circumstances, almost a guarantee of
continuance of the benevolent labour policies which have
red his administrations since 1933.

the year's advances the two competing federations, the
merican Federation of Labor and the Congress of Industrial
nizations, shared. The greatest single gain made by the
of L. arose out of the reaffiliation of the International
es' Garment Workers which, five years before, had been one
ne founding unions of the C.I.O. This action brought the
ration 250,000 members, a gain which was partially offset by
suspension of the International Typographical union, with a
bership of less than 100,000, for failure to pay per capita
s into a special assessment fund. A more consistent, though
spectacular, source of gain was the increasing recognition by
Labor Relations board of the right of employees to be repre-
ed by craft unions. Although the A.F. of L. lost its fight
mend the Labor Relations act, it substantially gained its
ctives by persuading or forcing the board to deal more
ally with the claims of craft organizations. The federation
won a signal victory in blocking the reappointment of J.
ren Madden as chairman of the Labor Relations board.

ne C.I.O. profited mainly from decisions of the Labor Rela-
s board and the expansion of the defence industries. Its
test victory of the year was won in the General Motors'
ions, held in April 1940. The employees of all but a few of
plants voted to be represented by the United Automobile
kers, affiliated with the C.I.O. With the exception of the
l company, the automobile manufacturing industry was thus

JOHN L. LEWIS bolted Roosevelt in a national broadcast Oct. 25, 1940, and declared his support of Willkie. In the event of Roosevelt's election, he said, he would retire from the C.I.O. He resigned and was succeeded by Philip Murray Nov. 22

brought under the control of a C.I.O. union. In the numerous
elections held throughout the year, C.I.O. affiliates were more
successful than their rivals in the A.F. of L. or among independ-
ent unions. Due to the great growth of defence industries, most
of which are under the jurisdiction of the C.I.O., these indus-
tries became the largest source of new C.I.O. membership.

As in previous years, the conflict between the C.I.O. and the
A.F. of L. defied solution. Internal dissension within the C.I.O.,
arising out of John L. Lewis' attacks on President Roosevelt
and his support of Wendell Willkie, the Republican candidate for
president, coupled with reactions against communist influences
in many C.I.O. unions, raised hopes of a popular demand for
peace in the labour movement. But the internal difficulties were
resolved, temporarily at least, by the resignation of John L.
Lewis and the election of Philip Murray as president of the
C.I.O., and a merger of the two movements seemed, at the close
of 1940, as far away as ever. Although the A.F. of L. was dis-
turbed by charges of racketeering against the officers of several
of its unions and by a series of government anti-trust suits
against some of its leading affiliates, its position with the public
and the administration in Washington was apparently improved
by reason of the decline in the prestige of John L. Lewis and
the fear of communist power in the C.I.O. This change in opin-
ion probably accounts for the appointment of D. W. Tracy,
president of one of the largest A.F. of L. unions, the Brotherhood
of Electrical Workers, as assistant secretary of labour. (See also
AMERICAN FEDERATION OF LABOR; CONGRESS OF INDUSTRIAL
ORGANIZATIONS; LAW [CASE]: *Labour*; STRIKES AND LOCK-
OUTS.) (L. Wo.)

Great Britain.—At the end of 1939 the trade unions in Great
Britain had a total membership of 6,234,000, of whom 5,258,000
were men and 976,000 women. The largest groups included in
this total were transport (road and docks) and general labour
(1,319,000), metal and vehicles (936,000), coal mining (707,000),
railways (470,000), national government (428,000) and building
and public works (420,000). In comparison with 1938 the largest
percentage increases in membership were in the clothing trade

(16.2%), the metal trades (9.8%), national government (6.7%) and agriculture (6.7%). The average increase in all groups was 3%, as compared with increases of 10% in 1936-37 and 3.6% in 1937-38. The Trade Union congress, to which most of the important unions belong, except those in the government service (which are precluded from joining by the Trade Union act of 1927), had in 1940 a total membership of 4,867,000, as compared with 4,669,000 in 1939. The figures for 1939 and 1940 are affected by the calling up of men for the armed forces. Some trade unions, especially in the skilled trades, retain such members on their books; but in many cases they drop out.

The war involved a large-scale redistribution of labour between trades and also between different parts of the country; but no figures showing the extent of these changes were published. Industrial migration was at the expense of the trades producing consumer goods into the metal and engineering trades in particular; while geographical migration was chiefly out of the eastern coastal areas into the midlands and northwest. The policy of the trade unions was from the outset to give the fullest possible support to the war effort; and in the war trades they willingly agreed to accept the temporary abrogation of trade union regulations and the dilution of skilled labour by the upgrading of less skilled workers, with or without a period of preliminary training. The unions further agreed to a system of arbitration in industrial disputes and to the suspension of strikes during the period of the war in all essential trades. The state, however, did not impose any general system of wage-regulation, and wage rates and conditions continued for the most part to be settled by the same processes of collective bargaining as in times of peace. The trade unions were represented, together with the principal employers' organizations, on a National Joint Advisory council over which the minister of labour presides; and this body was consulted in all matters affecting the formulation of general labour policy under war conditions, and also about other matters, such as war finance.

In view of the general support given by trade unionists to the war effort, there was an almost complete absence of serious industrial troubles. Strikes were few and small, and concerned almost exclusively with grievances arising in particular establishments. The work of the ministry of labour in organizing the supply of workers for the essential trades was facilitated, after Ernest Bevin became minister in May 1940, by a Labour Supply board, on which the trade unions had two out of the four seats.

Upon the collapse of France, the trade unions collaborated fully in the intensive effort which was made to speed up war production, waiving rules limiting hours of labour and encouraging the maximum amount of overtime work consistent with health and safety. They pressed hard for improved canteen and air-raid shelter arrangements in the factories and for better transport facilities to and from work which had often to be undertaken far from home. They also acquiesced in the taking by the government of power to order skilled workers to work in a particular factory, when their services were specially needed, though in normal times any such order would have been regarded as a form of "industrial conscription." The Trades Union congress of Sept. 1940 fully endorsed the policy followed by the trade union leaders in aiding the war effort to the full, but urged that steps should be taken at once to repeal the Trade Disputes and Trade Unions act of 1927 (passed after the general strike of 1926), which was widely resented by trade unionists as an unfair and vindictive measure limiting legitimate trade union activities.

France.—In France, the Confédération Générale du Travail was sinking in membership before the war began from the peak reached under the Front Populaire. In view of the communist opposition to the war, the C.G.T. took steps to expel the communist elements; and this involved a further fall in membership. No figures were available; but in any case they would give no indication of the position at the close of 1940, since under the Pétain government the old trade union movement was liquidated and an attempt was being made to replace it by some sort of corporative organization modelled rather on the Italian fascist unions than on the German Labour Front.

Lacrosse. The 1940 lacrosse season revealed the continued top strength of the University of Maryland as well as the return to power of Johns Hopkins and the fall of the mighty 1939 Navy team. Maryland, completing an undefeated season, inflicted the only loss Johns Hopkins suffered by beating them 7-6.

Navy, losing its best players by graduation, played one of the poorest seasons in its history. Its decline was climaxed by a defeat at the end of the season by its traditional rival, the cadets from West Point.

As in previous years, the strength of the college teams depended on the talent sent from the various prep schools. Consequently, Maryland, Johns Hopkins and Princeton, in getting the cream of the crop, were at the top of the heap. Princeton, though losing to Maryland and Johns Hopkins, beat all other rivals. Swarthmore, playing nearly in its class, was undefeated and won the Pennsylvania league championship. Duke and North

Carolina were the best in the Dixie league.

The All-Star Northern team beat the All-Star Southern team for the first time in the history of this annual meeting. King and Turner, both of Princeton, starred for the north, while Brown of Duke and Litz of Loyola sparked the southerners' attack.

Princeton and Maryland each placed two men on the 1940 American Lacrosse team; King for in home and Turner for goal, both of Princeton made the squad as well as Maryland's two stars, Mulitz for cover point and Nevares for out home.

During 1940 it was quite obvious that the season's teams were stronger and, as a result, there were more close games than ever before.

Lagerlöf, Selma (1858-1940), Swedish novelist, was born in Marbacke, Nov. 20, and died there March 16. For a biographical sketch see *Encyclopædia Britannica*, vol. 13, p. 592.

Laidlaw, Sir Patrick Playfair (1881-1940), English bacteriologist, was born Sept. 26. He was educated at St. John's college, Cambridge, and Guy's Hospital medical school, where he later served as demonstrator in physiology and lecturer on pathology. He was internationally noted as one of the leading students of viruses. In the course of his studies of the virus causing distemper in dogs he conceived the idea that influenza in human beings was a kindred disease, and in 1933 he isolated the germ. At the Harvard university tercentenary celebration in 1936 it was reported that his vaccine foreshadowed the final conquest of influenza. He died in London March 20.

Land Banks: see FEDERAL LAND BANKS.

Lansbury, George (1859-1940), British labour leader and pacifist, was born in Suffolk, Feb. 21, and died in London, May 7. See *Encyclopædia Britannica*, vol. 13, p. 706.

Latin America, also called Hispanic America, is that portion of the western hemisphere deriving its culture and institutions from Spain and Portugal. It includes the republics and the United States dependency of Puerto Rico. The language is Spanish, except in Brazil and Haiti, where Portuguese and French, respectively, are spoken, and in Puerto Rico, where English is on a legal parity with Spanish. Indigenous tongues are still used by large numbers in some regions, notably in Mexico, Guatemala, Ecuador, Peru, Bolivia and Paraguay. The area is approximately 8,050,000 sq.mi. The population is white, mestizo and Indian, with negroid elements predominant in Haiti and the Dominican Republic, and prominent in Brazil and Cuba, and along the coast of the Caribbean countries. The population (1938 est.) is about 115,000,000. The chief cities are: Buenos Aires, 2,364,263; Rio de Janeiro, 1,848,758; São Paulo, 1,322,600; Mexico City, 1,451,616; Santiago de Chile, 875,790.

During 1940 no political changes were effected by force; serious but abortive revolutions were attempted in Ecuador and Bolivia, however, and quasi-dictatorships replaced more constitutional governments in Panama and Paraguay. Presidential elections during the year brought changes in Cuba, Mexico, Costa Rica, Ecuador, Panama and Bolivia. As a consequence of the European war, serious economic dislocation was generally experienced.

With the exception of Bolivia, every country has important cultural resources. Coffee dominates the economy of Brazil; most of the Caribbean states; meat and wheat are the mainstays in Argentina and Uruguay, sugar in Cuba. Venezuela, Mexico, Colombia, Argentina, Ecuador and Peru are important for petroleum. Mexico and the Andean countries of South America, especially Bolivia, Chile and Peru, are leading metal producers. Manufacturing was developing rapidly, especially under the stimulus of European war conditions, but is generally quite inadequate for domestic needs. Argentina and Brazil have made the greatest industrial progress. Manufactured goods and foodstuffs were in 1940 the chief imports. Most of the foreign trade was with the United States and Europe, although there was an increasing interchange of goods between the temperate and tropical regions. In 1938 and 1939 the United States led in the trade with most countries, with Great Britain usually second, and Germany a close third. The United States' share of Latin American foreign trade was considerably larger in 1940 than in previous years.

Communication was generally inadequate, but highways, especially, and air transport service were being rapidly improved and extended. The Roman Catholic faith is predominant in all countries, with, however, a varying degree of relationship with the church itself. Argentina and Costa Rica have the highest rate of literacy. (See the articles on separate countries, and PAN-AMERICAN UNION; HISPANIC AMERICA AND THE EUROPEAN WAR.)

Latvia. Baltic country of north-central Europe, bounded N. by Estonia, S. by Lithuania and Poland, E. by Russia; area, 25,016 sq. mi.; population (est. Jan. 1, 1939), 1,994,500. Chief cities (population, 1935): Riga (capital, 385,063), Liepaja (57,000). Language: Latvian; religion, Christian (Protestant, 56%; Roman Catholic, 24.5%; Greek Catholic, 9%; Greek Orthodox, 9.5%).

History.—Like its neighbours, the small Latvian ship of state was shattered in 1940. The first breach occurred when it was made to sign a mutual assistance pact with the U.S.S.R. on Oct. 5, 1939, leasing to Russia the use of naval and military bases at Ventspils and other places. At that time its independence was guaranteed, but rapidly changing developments in the Baltic region soon made it impossible for the corporate authoritarianism led by Karl Ulmanis to withstand the march of the great powers and the division of eastern Europe between Germany and the soviet union.

Latvia went to the polls on July 14 to vote on the question of union in the soviet union, the election campaign for union being managed by the soviet commissar, Andrey Vyshinsky. The result came out as expected and a few days later a delegation left for Moscow. President Ulmanis, who had helped write the constitution of 1918 and had then made himself dictator by an army coup in 1934, was removed. Into the leadership of the new autonomous soviet state came a 68-year-old veterinarian and bacteriologist, Prime Minister Kirchenstein. The parliament immediately moved to nationalize banks and large industries. Meanwhile, Britain held Latvian ships in its ports, and the United States froze the available assets of all Latvians (the total such assets of the three Baltic states amounted to about \$2,000,000). American consular and consular offices were closed on demand of the U.S.S.R.

PIERRE LAVAL, shown here at his castle near Vichy, was generally considered the "strong man" of the French government after his appointment July 12, 1940, as vice-premier and ultimate successor to Marshal Pétain, but Pétain abruptly dismissed him from all offices Dec. 13.

Laval, Pierre (1883–), French statesman, was born June 28 at Châteldon, Puy-de-Dôme. For a brief biographical sketch, see *Encyclopædia Britannica*, vol. 13, p. 774. Laval had remained in comparative obscurity after the start of war in 1939 until he was delegated by Marshal Pétain to draft a new constitution July 5, 1940 after the downfall of France. A week later Pétain named him his successor as well as vice premier. During the succeeding weeks Laval, who had obvious pro-Nazi inclinations, made several visits to Paris and occupied France to consult with Hitler (Oct. 22 near Compiègne), Goering and other high German leaders. As early as September a rift was reported between Pétain and Laval, and on Dec. 13 the latter was abruptly dropped from the Vichy cabinet and temporarily interned. The Germans, through High Commissioner Otto Abetz, then apparently intervened on behalf of Laval and secured his release, though Pétain did not restore him to his former high offices. Pétain declared in a broadcast on Dec. 14 that he had dismissed the vice premier "for high reasons of interior policy" which had "in no way any connection with our relations with Germany." This statement tended to support rumours that Laval had attempted to engineer a coup d'état. Prior to his dismissal Laval had also been foreign minister and minister of information. In an interview prior to his conference with Hitler, Laval was quoted as having declared his belief that democracy was dead and that the victory of the axis was only a matter of time.

Lavedan, Henri Léon Émile (1859–1940), French dramatist, was born in Orleans and died in France in August. For a biographical sketch see *Encyclopædia Britannica*, vol. 13, p. 775.

Law (Case). The year 1940 was characterized by the concentration of efforts in behalf of national defence. The government undertook more widespread regulation. Trust-busting under the leadership of the attorney general succeeded in decentralizing many major monopolies. The achievements of labour outnumbered those of any prior year; its feuds

with management gave rise to a clear statement of the scope of freedom of speech and civil rights in general and their application to the realm of industrial disputes in particular. Control was continued over key industries such as agricultural products, coal, motion pictures, utilities and corporate endeavour generally.

Administrative Law.—An Illinois act delegating to administrative officers the power to prescribe the wage rate without setting a standard therefor was held unconstitutional, since it deprived the taxpayer of the benefit to be derived from the right of the employer and employee engaged in public work to contract freely (*Reid v. Smith*, Ill. Sup. Ct., Oct. 11). In another case an appeal was sought from a ruling of the Civil Service commission discharging the overseer of a municipal park. The supreme court of Iowa, holding for the plaintiff, ruled that the commission could not act as both prosecutor and judge (*Sandahl v. City of Des Moines*, 227 Iowa 1310, 290 N.W. 697). Further representative cases are considered in sections in this article dealing with labour and trade regulation.

Agriculture.—Agricultural regulation has been predominantly concerned with the milk industry. The supreme court of Michigan invalidated the state's Milk Marketing act because it provided for an administrative board composed of persons having pecuniary interest in marketing orders. (*Johnson v. Michigan Milk Marketing Board*, Mich. Sup. Ct., Dec. 10.) The Utah Milk Control act was declared unconstitutional as an undue delegation of power, for, in fixing prices, the board was directed to consider the cost of "producing, handling, pasteurizing and distributing" the milk to be sold (*Rowell v. State Board of Agriculture*, 99 P. [2nd] 1). The Pennsylvania Milk Control law was held not to apply to milk received by dealers on consignment, for the act nowhere refers to consignment, and administrative boards may not go beyond the zone permitted by the statute (*Green v. Milk Control Comm. of Pennsylvania*, Pa. Sup. Ct., Oct. 28).

Aliens.—Conduct of a woman in permitting her name to be included in her husband's certificate of naturalization as a German citizen, and holding herself out as a German citizen since that time, was held evidence of a renunciation of her United States citizenship. Accordingly, the attorney general denied her application for a passport as an American citizen (*Opinion No. 109*, vol. 39, of attorney general, Jan. 25). A child born in the United States and taken by parents to Canada during minority

did not lose American citizenship by making, shortly after attaining majority, application for Canadian land patent claiming Canadian citizenship by virtue of his father's naturalization. His election to retain United States citizenship may be inferred from facts showing that he returned to the United States immediately after filing such application, took up residence there and voted (*Doyle v. Ries*, Minn. Sup. Ct., Aug. 23).

Anti-Trust.—The latest technique used by the attorney general is to avoid litigation by compelling the defendants to sign a consent decree agreeing to abstain from certain practices and to comply with others.

By the consent decree method the government has undertaken through an intensive drive, to eliminate the unreasonable strains effected by labour union activity designed (1) to prevent use of cheaper material, improved equipment or more efficient methods; (2) to compel the hiring of unnecessary labour; (3) to enforce systems of graft and extortion; (4) to enforce illegal fixed prices and (5) to destroy an established system of collective bargaining.

The attorney general successfully procured the following consent decrees affecting: (a) military optical instruments (*U.S. v. Bausch & Lomb Optical company*, July 9); (b) the building trades (*Long Island Sand & Gravel company*, Aug. 22; *Southern California Marble association*, Nov. 12; *the Tile Contractors Association of America, Inc.*, June 10); (c) the milk industry (*U.S. v. Borden Co.*, Sept. 16); (d) the motion picture industry (*U.S. v. Paramount Pictures, Inc., et al.*, Nov. 20; *U.S. v. Fox West Coast Theatres, et al.*, Nov. 27); and (e) labour (*Arthur Morgan Trucking company*, Dec. 3).

Civil Rights.—**Freedom of Speech.**—A circuit court held that the lower court should have dismissed an indictment charging such a conspiracy to injure and oppress an editor of newspaper in the exercise of his right and privilege to write in the newspapers editorials exposing and condemning various forms of illegal gambling and calling on officials of a city to suppress the gambling and punish the offenders. The right of free speech and of free press, said the court, is guaranteed by the 14th amendment, "but this effect of the 14th amendment on state action is not enough to bring conspiracies of individuals within the punitive power of congress" under the statute (*Powe v. U. C.C.A.* 5th, Jan. 17).

Contempt.—It is not always simple to determine when freedom of speech ends and contempt begins. In one case a daily newspaper of wide circulation published an editorial approving the verdict of guilty in a criminal prosecution of sit-down strikers. It praised the jury and the court, discussed the importance of the verdict and its effect upon industrial strife being waged. In holding the paper for contempt the court noted that reference to "union terrorism and racketeering" can only be construed as implying that the convicted defendants had been engaged in such activity. (*Times-Mirror Co. v. Superior Court of California*, Jan. 31.) In another case it was held that a federal court had jurisdiction in summary proceedings to adjudicate a person in contempt for refusal to answer questions as a witness before a grand jury. (*Camarota v. United States*, C.C.A. 3rd, April 6).

Libel.—The extent to which freedom of the press is still cherished is reflected in a libel action by the president of the Worker's Alliance of California for an alleged charge that the officers of the alliance were diverting relief funds, collected by the individual members from the state, to further communist agitation under direct orders from the Third International. Although the plaintiff argued that he was one of the alliance's unpaid officers, that the defendant publisher and the chairman

EDITOR RALPH COGHLAN (extreme right) of the *St. Louis Post-Dispatch* was sentenced to 20 days in jail and a \$200 fine April 3, 1940, for contempt of court in criticizing a judge's disposal of an extortion case

Senatorial Investigating committee making the charge intended to refer to the plaintiff, and that many newspaper readers reasonably believed that the plaintiff was designated, the complaint was dismissed substantially on two grounds: (1) that publication did not defame an ascertainable person and (2) that freedom of the press should not be unduly restricted where no harm would result from comment upon matters involving public policy is concerned.

Privacy.—In *Sidis v. F-R Publishing Corp.* (113 F. [2nd] 806, 2d Cir. 1942), the plaintiff had been a greatly publicized child prodigy. Upon reaching maturity he suffered a general breakdown and thereafter went to great efforts to live in complete privacy, with comparative success until defendant printed an article reviewing in intimate detail plaintiff's life history and the facts and circumstances of his present humble existence. Plaintiff's action for violation of his right of privacy was dismissed on the ground that a quondam public character is still of interest to the public, justifying the probing of his privacy.

Obscenity.—The United States Circuit Court of Appeals for the District of Columbia decided that an imported book entitled *Disgrace in Modern Life* is not subject to confiscation and destruction on the ground that it is obscene within provisions of the Tariff act of 1930 by reason of the presence therein of three photographs in which appear full front pages of nude male figures, and two photographs in which nude male and female figures appear together.

Nudity. the court ruled, is not obscene *per se* and under all circumstances. "Civilization has advanced far enough, at least, to permit picturization of the human body for scientific and educational purposes."

Constitutional Law.—A discriminatory salary schedule fixing a higher minimum wage for white teachers than for Negroes of equal qualifications and experience, and performing the same duties, was held unconstitutional (*Alston v. School Board of City of Norfolk*, 112 F. [2nd] 992 [C.C.A. 3rd]). The state of Virginia, which levies a tax on the sale of securities, may not also issue bonds within its debt limits, for military appropriations (*in re Opinion of the Justices*, 13A [2nd] 33 [Maine]).

Copyright.—A three-judge federal court invalidated a Florida statute which outlawed combinations of composers, authors and publishers constituting a substantial number of those having interests in musical compositions thereof. The combination purported to fix prices for the rights to perform copyrighted music. The court pointed out that it sought to impose on copyright holders restrictions which had no reasonable relation to the public policy the act was designed to further, that of disclosure of the protection of the public against fraud and imposition (*Wick v. Gibbs*, U.S.C.C.N. Fla. Aug. 5).

Evidence.—Where the search for evidence was illegal, the evidence is inadmissible (*United States v. Thompson*, 113 F. [2nd] 888, C.C.A. 7th). Parties to a contract cannot alter rules of evidence precluding judicial inquiry into the facts (*Shultz v. American Nat. Ins. Co.*, 142 S.W. [2d] 275). Blood test to determine intoxication, being taken without the subject's consent from one having no authority, was held inadmissible as illegally obtained evidence (*State v. Weltha*, 292 N.W. 148 [Iowa]). Telephone records may not be admitted into evidence if there is an interception unauthorized by the sender (*United States v. Akoff, et al.*, 112 F. [2nd] 888 [C.C.A. 2nd]).

Labour.—The National Labor Relations board vastly enhanced jurisdiction through the doctrine of integration, that is, if any part of a company's operations affect interstate commerce,

any other part of the same business may be subject to the Wagner act (*Virginia Electric & Power company v. NLRB*, 115 F. [2nd] 414, C.C.A. 4th). In *Montgomery Ward and Co., Inc., v. NLRB* (C.C.A. 8th, Dec. 2), the court held that a system of surveillance of employees, although initiated by the employer for purely legitimate purposes, may become unlawful when utilized for the additional purpose of securing information regarding union organizations and intimidating union members. In another case (*The Press Co. v. NLRB*, Ct. of App., D.C., Dec. 9) it was held that there was no authority under the Wagner act to outlaw employer surveillance of employees in and of itself, even if union activities are covered by it. The court, however, did support the Labor board because it found the information was secured as a basis for discriminating against union members. In short, the test of whether such surveillance or labour espionage will be permitted is the use made of such findings.

Among the rights of labour determined are: (1) *Freedom of Speech.* The circuit court held that "the constitutional right of free speech is just as clearly a right of employers as of employees" and that "the employer has the right to have and express a preference for one union over another so long as that expression is the mere expression of opinion in the exercise of free speech and is not the use of economic power to coerce, compel or buy the support of the employees for or against a particular labour organization." (*Continental Box Co. v. NLRB*, 113 F. [2nd] 93, C.C.A. 5, June 27); (2) *Right to Organize.* The circuit court of appeals in New Orleans held that the law flatly prohibits the formation of employees' associations which though "ostensibly independent" are in fact really "influenced, though ever so slightly, by the management." Such an association of employees, the court ruled, may not be recognized as representing the employees under the Labor act (*NLRB v. Lane Cotton Mills Co.*, 108 F. [2nd] 568, C.C.A. 5th). The circuit court of appeals in San Francisco, on the other hand, decided that employees have vital "civil rights" freely to organize themselves if they so desire into "inside" associations; that it is as much the duty of the Labor board to protect such an association as it is to destroy an employer-dominated union (*NLRB v. Sterling Electric Motors, Inc.*, 114 F. [2nd] 738); (3) *Right to Picket.* As anti-picketing ordinances mounted in number, courts have manifested a distinct trend toward invalidating them as unconstitutional curbs on the inviolate right of assembly and free speech. An appellate court in California (*California v. Garcia*) and the supreme courts of Nevada (*City of Reno v. Second Judicial District court*, LRR 671) and Oregon (*American Federation of Labor v. Bain*, LRR 563) invalidated anti-picketing ordinances. These courts rely upon the United States supreme court's decision in *Hague v. C.I.O.* reiterating the constitutional guarantee to the right of assembly and freedom of speech. The Michigan supreme court has been the latest to join the ranks in declaring peaceful picketing to be lawful (*Book Tower Garage, Inc. v. Local No. 415, International Union, United Automobile Workers of America*, Dec. 10); (4) *The Right to Counterproposal.* Under this doctrine an "illusory" counterproposal may likewise be charged a refusal to bargain collectively. Where, however, the employer's refusal to offer counterproposals is indicated by insubstantial evidence, his refusal will not be deemed lacking in good faith (*Easton Publishing Co.*, 19 NLRB No. 43); (5) *Reinstatement and Back Pay.* Employers were required to reinstate union employees with back pay, even though the only reason for the discharge was that all other employees, members of a rival union, struck against working with them, and the employer's only alternative was discontinuing operations entirely (*Cape Cod Trawling Corp.*, 23 NLRB No. 18). Under the ruling of the circuit court

ROBERT H. JACKSON was nominated U.S. attorney-general Jan. 4, 1940, to succeed Frank Murphy

of appeals in Boston, the Labor board was supported in its order for "back pay" and "instatement" for disappointed applicants for employment who were discriminated against because of their union activities. (*NLRB v. Waumbe Mills*, 114 F. [2nd] 226, C.C.A. 1st.) A contrary view was taken by the New York Circuit Court of Appeals in *NLRB v. Yale & Towne Mfg. Co.* (114 F. [2nd] 376, C.C.A. 2nd). In *Hamilton Brown Shoe Co.* (E.D. Mo., May 6) a federal district court held that the Labor board may make no claim for back pay in a bankruptcy proceeding on the theory that it was a provable debt based on an implied contract owing to the government for the benefit of the employees. The court ruled that the board's power to order affirmative action is limited to orders against going concerns; (6) *Elections and Representation*. In *Easton Publishing Co.* (19 NLRB No. 43) the Labor board ruled that employees hired to replace strikers are barred from a collective bargaining election even though the strike was not caused by any unfair labour practice by the employer and was more than ten months old; (7) *Agreements in Writing*. An employer may not refuse to embody an agreement with the union in writing merely because of his desire to continue certain practices on a voluntary basis (*in re Singer Mfg. Co.*, NLRB No. C-1336, June 6).

Among the practices declared unfair were: (1) Refusal to recognize a certified union as exclusive bargaining agent of employees after a rival union claimed that it represented the majority of employees (*Valley Mould Iron Corp. v. NLRB*, C.C.A. 7th, Dec. 17); (2) Speeches and notices that union membership was not required for continued employment (*in re Blue Bell-Globe Manufacturing Co.*, 24 NLRB No. 3). The dissemination of anti-union propaganda was held not to "interfere with, restrain or coerce employees" (*NLRB v. Ford Motor Co.*, 114 F. [2nd] 905, C.C.A. 6th).

Social Security.—A person filling positions of general manager and sales manager, with authority in both capacities to hire and discharge, who received no salary but was paid separate commissions on volume of sales and selling price, paying salesmen therefrom, is not an employee. (*Beaverdale Memorial Park, Inc. v. Danaher*, Conn. Sup. Ct. Err., Aug. 14.)

Solicitor of orders on a commission basis, who sells trade-ins and accessories on his own account and also does repair work in connection with sales activities is an employee under Oregon Unemployment Compensation law, although working from home at his convenience and paying all expenses. (*Singer Sewing Machine Co. v. State Unemployment Compensation Comm.*, Ore. Sup. Ct., June 25.)

A purported partnership agreement between employer (conducting painting and decorating business) and painters, which the effect of employer receiving profits and standing losses, business in certain maximum amount and other "partners" receiving payment for work actually performed, does not destroy employer-employee relationship (within meaning of New York unemployment insurance law) (*in re Scott*, N.Y. App. Div., Dept., Oct. 31).

Taxation.—A municipality may properly expend funds to attract a new industry under a charter authorizing the city to expend for general welfare (*City of Fernandina v. State*, 197 454 [Fla.]). A shareholder's income from an insurance policy the president of the corporation was held taxable as dividend (*Golden v. Commission of Internal Revenue*, 113 F. [2nd] 4 [C.C.A. 3rd]). Trust income, even though made available to beneficiary, was held taxable to the settlor if he retained a right to that income (*Helvering v. Mercantile-Commerce Bank & Trust Co., et al.*, 111 F. [2nd] 224 [C.C.A. 8th]). A Wisconsin statute taxing the declaration of dividends, held invalid by the state court (*J. C. Penney Co. v. Wisconsin Tax Comm.*, 298 N.W. 6 [Wis.], was declared constitutional by the United States supreme court [Jan. 1941]). The state of Pennsylvania could tax a resident's equitable interest in personal property even though the property was located in another state (*Commonwealth v. Stewart*, Pa. Sup. Ct., March 25).

Trade Regulation.—The Federal Trade commission's role in trade regulation has been a large and varied one, charged as it is with the enforcement of the Robinson-Patman act and Federal Trade Commission act. From the numerous rulings and decisions we select a few broadly indicative of the manner in which the commission is policing industry.

Robinson-Patman Act.—The Robinson-Patman act condemns the receipt of commissions by a brokerage firm which controls the buyer or is controlled by the buyer, if the transaction is in interstate commerce. A seller cannot pay brokerage to persons who in fact act for and represent the buyer in making the purchase. The fact that the brokerage firm renders services to the seller is immaterial (*Webb-Crawford Co. v. Federal Trade Commission*, 109 F. [2nd] 268, cert. den.; *Great A. & P. v. F.T.C.*, 106 F. [2nd] 666, cert. den.).

Unfair Competition.—In the few cases decided by the court the Federal Trade commission was upheld in its rulings in Robinson-Patman cases. It enjoyed similar successes in the field of unfair competition. In its significant case against Fashion Organizers Guild of America, the Federal Trade commission ordered that the trade association of dress manufacturers cease and desist from its efforts to suppress style piracy. The 2nd Circuit Court of Appeals, upholding the commission, read into the guild "a combination seeking to exclude outsiders from a market which they have as lawful access as it has itself." The fact that the guild sought to remedy an evil practice did not change the character of the boycott.

Fair Trade.—With the establishment of the constitutional basis of the Fair Trade laws in 1936, efforts have been made to circumvent the rigid controls of such resale price maintenance. In one case a retailer sought to sell such products at less than minimum resale price fixed in contracts made under the New Jersey Fair Trade act. New Jersey chancery court decided that the marketing of such a combination package constituted an abandonment of the fair trade contract and denied an injunction to the manufacturer restraining the retailer from selling such products at less than minimum resale price (*Bathasweet Corp. v. Weiss Bros.*, N.J. Chanc. Ct., Oct. 2).

Loss Leader Laws.—Loss Leader laws have not fared as well as their companion, the Fair Trade laws. One such illustration

Wisconsin Unfair Practices act which limited localities to which the act could be made applicable. This discrimination was denounced by the court as an improper classification of counties, cities and towns by population, a differentiation which the court was not warranted by the objectives of the act and hence unconstitutional (*State of Wisconsin v. Neveu*, Wis. Sup. Nov. 20).

On the other hand, the provisions of the Connecticut statute which prohibited wholesalers and retailers from selling, offering for sale and advertising for sale merchandise at less than cost was upheld, the court ruling that the act was not a penal statute nor was it a price fixing law (*Carroll v. Schwartz*, Conn. Sup. Ct. Aug. 7).

The provisions of the California Unfair Practices act have been held inapplicable to sales to the federal government. (*Metropolitan District Material Dealers' Assn. v. Eastside Bldg. Materials Co.*, Calif. Super. Ct., Los Angeles City, Aug. 26.) (See also *KRUPTCY*; SUPREME COURT OF THE UNITED STATES.)

Lead. The nine chief lead-producing countries, with outputs in excess of 50,000 tons, supply nearly 90% of the world's lead, the remaining 10% being scattered among a large number of minor producers, only five of which, France, Italy, Poland, United Kingdom and Japan, produce amounts in excess of 50,000 tons. World production declined 33% from 1929 to 1932, but in 1939 had recovered to 98% of the former high; the 1939 output increased by 1%, to 1,722,700 tons, while preliminary estimates for 1940 indicated some increase.

United States smelter production increased 9% in 1940, to 1,500 metric tons, but the refinery output, which includes scrap lead series, made a better showing, the total for the first 11 months being 475,000 tons, or 5% more than for the whole of 1939.

World Production of Lead
(In thousands of metric tons)

	1929	1932	1937	1938	1939
Australia	177.3	189.2	234.4	235.7	252.4
Belgium	62.2	61.5	88.0	90.5	96.0
Canada	148.0	116.1	186.4	185.7	177.9
Germany	97.9	95.2	162.4	171.7	181.4
France	81.5	72.3	78.9	81.4	78.6
Mexico	248.8	130.3	231.2	242.7	215.7
U.S.A.	133.3	109.8	30.0	36.0	27.0
U.S.S.R.	6.2	18.7	55.0	69.0	75.0
United States	624.2	251.7	426.3	344.4	381.4
World Total	1,756.8	1,179.7	1,719.6	1,704.2	1,722.7
Ex. U.S.	1,132.6	928.0	1,293.3	1,359.8	1,341.3

Shipments to consumers at the end of November were 1,500 tons, 7% over the figure for the same period in 1939. At the end of July, Mexico was 10% behind 1939. No 1940 shipments were available from other producers.

Through the occupation of France, Belgium and Poland, Germany secured control of some 160,000 tons of smelting capacity, since most of this was operated on imported ores, it resulted in little relief to the German shortage, beyond such stocks as were on hand in the plants. Great Britain was even more dependent on imports than Germany, and while no sources of lead were lost, access to the remote empire sources (Australia, Canada and Burma) was made more difficult. (G. A. Ro.)

League of Nations.

The work of the League of Nations, an organization concerned with the development of co-operation and the improvement of relations between states, was bound to suffer by the temporary ascendancy of the league's antithesis—war, a state of enmity and disunity.

But the league was making one big contribution to the future—it was keeping alive a centre of international collaboration and sanity, where men's efforts are co-operative.

Up till the collapse of France, many of the league's organizations at Geneva were able to carry on important work in spite of depleted staffs and budget. For example, the league co-ordinated the nonmilitary assistance of many governments to Finland, in her resistance to Russian aggression. The value attached to this may be gathered from the earnest appeal of Finland to the league for its continuance and increase after her surrender. The health organization carried on. The Singapore bureau worked as efficiently as ever, to the advantage of all, belligerent or neutral. Turkey was given essential serums when a series of earthquakes menaced the health of thousands.

League experts kept on helping China to fight against diseases caused by the war, especially in the northwest provinces. At Geneva research work was published on social and medical plans for the transfer of large populations, and more was in hand regarding nutrition.

The various league committees dealing with the control of the drug problem held their normal sessions, with the support of the big majority of civilized states. It was vital to keep the machinery of control in being, for war increases the menace of illicit traffic. This was already a major danger in the far east, where the Japanese military authorities would seem to have encouraged drug addiction to destroy the stamina of the Chinese. Above all, initial steps were taken, at the Hague and Geneva, to create a new committee (arising out of the 1939 Bruce report) to guide and control all the nonpolitical work of the league. It was to be the aim of this committee, on which states not members of the league will sit, to apply the results of scientific study to the problems of human life and social security. The remarkable work of the International Labour organization (*q.v.*) was encouraged by the warm support of all the American states.

But with the overrunning of the neutral states by Germany, and the sudden surrender of France, this record of work was abruptly checked. Switzerland became an island in a sea of totalitarian or pro-totalitarian states. Communications with the world were precarious. War made effective membership of the league by the Scandinavian states, the Baltic provinces, Belgium and France a question mark. German occupation closed the Hague Court of International Justice in the middle of its work. No sessions of the council of the assembly, or of the larger committees, could be held at Geneva. If the league machinery was to be kept in being, large-scale changes had clearly to be made. In July 1940, the secretary-general, M. Avenol, sent in his resignation, and in September his place was temporarily filled by the deputy secretary-general, Sean Lester, who had won a big reputation as league commissioner at Danzig, under almost impossible conditions. Decentralization began. A portion of the league's work might go on at Geneva; but at least two of its most creative and dynamic bodies, the International Labour organization and the Economic and Financial committee, found a home across the Atlantic. McGill university, Montreal, housed the former, and Princeton university, U.S.A., the latter. Here, with welcome American and Canadian assistance, programs of research work on vital problems arising out of the war and likely to arise out of postwar reconstruction, were under way.

The catastrophes of 1940 inevitably affected league finance. When meetings of assembly or council became impossible the supervisory commission, whose normal business is finance, was invested with wide general powers. It managed to meet at Lisbon in September.

New factors had to be taken into account. In the Palais des Nations, the secretariat, under Sean Lester who had succeeded

M. Avenol, still operated with a staff of about 100 as compared to over 600 in peacetime. All departments and services still worked, if only in skeleton.

And war had made many of the league's problems, economics, finance, health, child welfare, the drug traffic, refugees, more important than ever. In addition the economic and financial department by the autumn had a new operating centre at Princeton, N.J.

The supervisory commission stressed the wide scope there still was for the league in technical, social and humanitarian activities, but in view of the facts decided to halve the normal league budget. War and enemy occupation had made the situation of several countries uncertain. Temporary suspension of contributions accordingly was sanctioned for Albania, Belgium, Denmark, Estonia, Latvia, Lithuania, Luxembourg, Norway and Poland. The contributions of China, Finland, France and Holland were halved. The league thus could, it was expected, count on an income of about £500,000, of which one-third goes to the International Labour organization. In case of unforeseen events the reserves established by previous wise financing could be drawn on. But prompt, regular payment by league members was, the commission reported, the best way in which to support the league. Finance was the key to the future. (See also MANDATES; PACIFISM; REFUGEES.)

"Lease-Lend" Bill (H. R. 1776): see DEFENCE, NATIONAL; INTERNATIONAL LAW.

Leather. An advisory organization enumerated, with reference particularly to the leather industry of the United States, eight objectives as most worthy of research. These were the devising of more rapid tannages for heavy leathers, the development of leather dyeing formulas capable of a more uniform and exact reproduction of colours, a chemical or process that would eliminate iron from solutions of tanning materials, a means to prevent discolouration of leather on exposure to light, improvement in the washability of leather gloves, a material to combat greasy spew that affects certain types of leather, a satisfactory process for tannage of white leather and measures to increase the weight, or heft, of leather.

Concerning the foregoing subject, British research workers reported a white leather made with formaldehyde without preparatory tannage with another material. The leather is full and has a strong grain. It is washable with soap and water and does not become tender upon storage, as was found to be true with former formaldehyde tannages.

It was recommended that cleaners for white shoe leathers should be fortified with lubricating oils. Sulphonated coco-nut oil was proposed with the suggestion that a small bottle of it be furnished with each pair of shoes, with instructions for its application after every ten cleanings.

The removal of chromium from chrome-tanned leather, a treatment applied frequently to scrap leather in making glue, can be done in a variety of ways. Among the acid dechroming agents, the organic acids are more effective than the inorganic. Salts of these acids whose negative ions are good penetrating agents like-wise dechrome. Alkaline and alkaline-oxidizing agents, such as borax, sodium bicarbonate, sodium hydroxide, triethanolamine and sodium perborate, also exert a pronounced dechroming action.

To promote research in the production of leathers of greater resistance to atmospheric decay, a standardized gas chamber for accelerated ageing was developed. The unique feature of this apparatus is that the pollution of the atmosphere within it is produced and controlled through the burning of a fuel comprising methyl alcohol containing known concentrates of *n*-amyl sulphite.

Experimental work indicated that the retanning of vegetable-tanned leather with alum imparts to the leather exceptional resistance to acid rot. Use of alum salts appeared to possess several advantages over the similar use of chromium compounds and alum does not produce the bluish to greenish undertones often resulting from chrome.

Appreciable attention was given to the production of a pig leather of sufficient durability, resistance to tearing and pliability to serve for shoe uppers. Promising developments in this direction were attributed primarily to a new method of removing grease from the skins, necessary before they can be tanned.

War activity resulted in marked changes in world production and international trade in leather during 1940. Many of the important European leather producing centres were partially or entirely destroyed, while others were invaded and their raw materials and finished products removed as spoils of war. The output of leather in Europe was believed to have been considerably above normal in the first half of 1940 but to have declined sharply in the following six months as a result of war activity.

In virtually all countries engaged in fighting and in most of the others where military preparedness was in full sway, there were efforts to increase or maintain production of heavy leathers even at the expense of reduced output of the light varieties. Where domestic supplies of suitable hides were not sufficient and foreign stocks could not be obtained readily, the use of heavy leathers was restricted generally to the armed or defence forces and in all of the countries at war there were regulations governing the use of leather.

Because of the increased demand for military leather in several countries and the difficulty of obtaining sufficient supplies for civilian use, mainly in Germany and Italy, authorities in these areas fostered the production of suitable substitutes. With the use of genuine leather restricted by regulations, consumers found it necessary to use the substitutes and producers benefited from the opportunity of accomplishing considerable research for improved products at minimum costs. Many different types of leather substitutes were developed in Europe since the middle of 1939 and new materials continued to appear on the market regularly.

One of the important aftereffects of the war of 1914-18 was the development of tanning industries in many countries that previously obtained almost all their requirements from foreign sources. Such areas were forced to develop domestic tanning industries.

ause war conditions did not enable them to import the desired quantities and varieties of leather.

The indications were that the war of 1939 would result in the opening of a much wider range of leathers in many countries for the same reasons. The fact that so many of the important European tanning centres suffered from the effects of this war would not be in a position to operate again for many years corroborated this opinion.

Legislation. **Federal.**—Events abroad vividly pointed out the necessity for preparedness. In response to the call of war congress enacted legislation designed to enlist manpower, industry and wealth.

Selective Training and Service Act.—See SELECTIVE SERVICE. **Soldiers' and Sailors' Civil Relief Act: National Guard Act.**—The Soldiers' and Sailors' Civil Relief act of 1940 was passed to protect the economic position of the conscript by certain statutory provisions, suspending the enforcement of civil liabilities in certain cases to enable persons engaged in the military service of the United States to devote their entire time to the defence and needs of the nation. The most important provisions designed to mitigate the economic hardships due to loss of employment. Re-employment provisions require that the conscript receive a guaranty that his job will be restored to him with reparation for any loss caused by the employer's unlawful refusal to rehire him on his return. The statute does not, however, require employment where it is "impossible or unreasonable." Thus, for example, reinstatement would hardly be obligatory in the case of necessary reduction in employment or discontinuance of the business.

The benefits of insurance shall apply to any person in military service who is the holder of a policy of life insurance, when the holder shall apply for such benefits on a form prepared in accordance with regulations which shall be prescribed by the Administrator of Veterans' Affairs. The benefits of this act shall

be available to any person in military service in respect of contracts of insurance in force under their terms up to but not exceeding a face value of \$5,000, irrespective of the number of policies held by such person whether in one or more companies, when such contracts were made and a premium was paid thereon before the date of approval of this act or not less than 30 days before entry into the military service. In no event, however, shall the provisions of this article apply to any policy on which premiums are due and unpaid for a period of more than one year at the time when application for the benefits of this article is made or in respect of any policy on which there is outstanding a policy loan or other indebtedness equal to or greater than 50% of the cash surrender value of the policy.

The provisions of this section shall apply when any taxes or assessments, whether general or special, falling due during the period of military service in respect to real property owned and occupied for dwelling, agricultural, or business purposes by a person in military service, or his dependents at the commencement of his period of military service and still so occupied by his dependents or employees, are not paid.

Nationality Act.—This act codifies all the laws of the United States dealing with citizenship, nationalization and expatriation and amends many of the previous laws concerning national defence and subversive activities.

Persons who served honourably in the army, navy or marine corps or coast guard for an aggregate of three years are relieved from complying with the five-year period of residence, declaration of intention, certificate of arrival and residence within the jurisdiction of the naturalization court.

For the commission of any act of treason, the penalty is loss of citizenship, but only after conviction by a court martial or a court of competent jurisdiction. Citizenship may also be lost by obtaining naturalization in a foreign state, taking an oath of allegiance to a foreign state, serving in a foreign military force when such service may only be rendered by its nationals, or voting in a foreign political election. Citizenship may further be lost by a naturalized citizen who resided for two years in a foreign state, of which he was a national, or where he was born, if he acquired, through such residence, the foreign nationality, or for three years otherwise. In the case of other foreign coun-

THIS SUPPORT of the U.S. draft bill, Sen. Claude Pepper of Florida drew the wrath of a group of women anticonscriptionists who proceeded to hang an effigy Aug. 21, 1940, on the capitol lawn

tries, expatriation would result from a residence of five years.

National Defence: Sabotage.—The act of April 20, 1918 (40 Stats. 533) provides a penalty of \$10,000 fine or imprisonment for 30 years, or both, for wilful injury to or destruction of war materials, war premises or war utilities, whenever the United States is at war. Three new sections are added to the statute which provide a penalty of \$10,000 fine or 10 years' imprisonment, or both, for attempt at or wilful injury to or destruction of premises, facilities, materials used for national defence purposes, and which are defined as "national defence" materials, premises and utilities in language similar to that used in the 1918 act to define war materials, premises, etc. The penalties provided also apply to any attempt to make up national defence procurement orders—tools, machines, etc.—in a defective manner.

The amendments provide penalties for acts of sabotage in connection with national defence while the nation is not at war, the original act of 1918 providing only wartime penalties. The definition of the United States is to include the Philippines as well as the Panama Canal Zone.

Industrial Mobilization.—In view of the emergency, congress authorized the mobilization of U.S. industry into a pre-war economy. This was ordered to expedite and co-ordinate the procurement of contracts and to establish methods of vesting the government with priority control and the power to commandeer manufacturing facilities and order the expansion of production facilities.

Excess Profits Tax (Second Revenue Act of 1940).—The excess profits tax, according to its sponsors, was enacted principally from a desire to prevent profiteering. It is imposed on net income in excess of a certain sum which is called, in the language of tax laws, "the excess profits credit." It is applicable only to corporations or such organizations as may be classified as associations taxable as corporations; only to corporations whose "excess profits net income" for the taxable year, placed on an annual basis, exceeds \$5,000; to corporations whether engaged in defence work or not.

The act increased the tax on normal income of corporations earning net profits of more than \$25,000 a year from 19%, as provided in the Revenue act of 1940, to 24%. (Both the 1939 rate of 18% and the 1940 rate of 19% have thus been superseded before going into effect.)

It imposed the following additional graduated rates on "excess profits" on all corporations not specifically exempted:

On excess profits not exceeding \$20,000	25%
On the next \$30,000	30%
On the next \$50,000	35%
On the next \$150,000	40%
On the next \$250,000	45%
On all over \$500,000	50%

It defines excess profits according to two formulas, of which the taxpaying corporation may take its choice:

(a) *Average earnings.* All profits in excess of 95% of the average earnings for the base period 1936 through 1939, inclusive, not more than one deficit year to be counted as zero in computing the average earnings of the base period.

(b) *Invested capital.* All profits in excess of 8% of the taxable invested capital, including all "equity" capital and 50% of "borrowed" capital.

Except for corporations which have resulted from certain types of mergers and consolidations, the average income method may be elected only by those corporations which were in existence before Jan. 1, 1940 and which make the election in their returns.

All corporations subject to the tax are allowed initial excess profits of \$5,000, to be exempted from the levy. Corporations with normal net incomes of \$25,000 or less are permitted to carry over the unused portion of the excess credit for a period of one year, provided the income during the second year does not

exceed \$25,000. Parent corporations owning 95% of all class of stock of affiliates (except non-voting preferred) are allowed to file consolidated returns. The commissioner of internal revenue is given authority to make necessary adjustments of abnormalities relating to income or capital. Corporations building plant facilities, certified by proper governmental authorities as necessary for national defence, are permitted to amortize the total cost of such facilities out of tax-free earnings over a period of five years, provided such facilities are completed at or before June 10, 1940. The taxpayer may elect either method in determining his "excess-profits credit." Once having made an election, however, he is bound and cannot subsequently adopt the other method for that tax year.

Failure to file a return when one should have been filed in the opinion of the treasury department, subjects the delinquent taxpayer to a 25% penalty and deprives it of the full advantage of the statute of limitations. Filing an incomplete return is equivalent of failure to file.

Alien Registration Act.—Some of the provisions of this act, neither restricted to aliens nor involving the mere formality of registration, make unlawful influences designed to obtain the overthrow of any government in the United States by force or violence, or "in any manner cause insubordination, disloyalty, mutiny, or refusal of duty" by a member of the armed forces.

Of the various factors indicating whether particular influences are to be classified as undesirable, foreign origin has been accorded increasing weight. Reliance has been placed mainly on three sources of proving the origin of influences:

1. Taking orders or advice from foreign principal.
2. Accepting gratuities or compensation from foreign principal.
3. Membership limitation in organizations.

Revenue Act of 1940.—The principal provisions of the Revenue act of 1940, approved June 25, are as follows:

Personal exemptions were lowered from \$1,000 to \$800 for single persons and from \$2,500 to \$2,000 for married persons. The 4% normal tax on individuals was not changed, but surtax rates have been increased in all the brackets from \$6,000 to \$100,000. Rates on the bracket from \$4,000 to \$6,000 and on all brackets in excess of \$100,000 are unchanged.

In addition to the above changes, which are permanent in character, a defence tax amounting to 10% of the income tax is imposed for the next five years. There is a limitation upon the supertax. It is provided that "in no case shall the effect of this section be to increase the tax computed without regard to this section by more than 10% of the amount by which the net income exceeds such tax." For example, if the permanent income tax amounted to 60% of the net income, the supertax would be 4% of income (that is, 10% of the amount by which the net income exceeded the tax) instead of 6% of income (which would be the amount that 10% of the tax would equal).

Returns must be filed by single persons with a gross income of \$800 or over, and married persons with a gross income of \$2,000 or over.

The changes in rates provided for in the Revenue act of 1940 will not go into effect as these rates have been superseded by the 1940 act. The 18% general rate on corporations with income of more than \$25,000 has been increased to 19%. Upon small incomes the normal tax rates are as follows:

Net incomes not in excess of \$5,000—	13½%
More than \$5,000 and not more than \$20,000—	15%
More than \$20,000—	17%

A defence tax of 10% of the tax computed at the above rates is superimposed on the normal tax. A 10% defence supertax is also applicable to the surtax on improper accumulations, and

STORIC PIECE OF U.S. LEGISLATION. The first American military conscription in peacetime came into effect Sept. 16, 1940, as President Roosevelt signed the Burke-Wadsworth Selective Service bill

tax on personal holding companies.

Investment Company Act.—The Investment Company act of 1940 was passed to cure alleged abuses existing in investment companies, among them: (1) Removal of funds from control of the person who supply them, (2) conflicting interests of management, (3) pyramiding, (4) excessive management charges and hidden fees, and (5) management's use of control. The sponsors, or organizers, of investment companies and investment trusts usually retained management in their own hands and constituted a group of "insiders" who had obtained control of the fund.

A further provision delimiting the control of management and providing for a degree of control by the investing public is made in section 15. Subdivision (a) states that investment advisers must be under a contract approved by a majority vote of the holders of voting securities. Further, this contract must clearly state the compensation, but be for only a two-year period, may not be renewed with the annual approval of a majority of such security holders, must be terminable on 60-day notice by the board of directors or by a majority of the shareholders, and must automatically terminate on assignment. Section 15(b) requires that contracts with principal underwriters be for a maximum of five years, be non-assignable and renewable only by the annual approval of the board of directors or a majority of the security holders, and subdivision (c) requires the approval by a majority of the disinterested directors or stockholders of any contract

with an investment adviser or principal underwriter.

The act contains certain provisions aimed to meet the abuses of "excessive charges for management" and "hidden fees." Section 18(d) prohibits the issue of purchase warrants except ratably to a class of shareholders, and provides that they must expire after four months; section 22(b) prohibits the sale of redeemable securities to an underwriter or dealer at a discount except in accordance with certain rules; and section 22(c) gives the commission power to prevent or remedy exorbitant sales loads.

Other safeguards contained in the legislation are: section 12, prohibition of margin purchases, authority to Securities and Exchange commission to regulate short sales and dealing in and distribution of own securities; section 19, requirement of disclosure of sources of dividends and prohibition of dividends unless there would remain certain prescribed asset coverage for the remaining securities; section 32, requirement of financial statement certified by a public accountant chosen or approved by the security holders.

The Securities and Exchange commission is empowered to issue rules and regulations and to enforce certain penalties for non-compliance. Provision is also made for appeal to the United States circuit court of appeals from such orders and findings of the commission.

Transportation Act.—The text of this act alters many provisions of the present Interstate Commerce act while adding a new part III to regulate water carriers. It is the most important piece of transportation legislation enacted since the passage of

the Transportation act of 1920. The act is set up in three titles. Title I—Amendments to existing law, covers various changes in part I, the railroad part of the Interstate Commerce act, and in part II, the Motor Carrier act; Title II—Regulation of Water Carriers in Interstate and Foreign Commerce, is the Interstate Commerce act's new part III; and Title III—Miscellaneous, covers such matters as the investigation of various modes of transportation, conditional repeal of land-grant rates, and the liberalizing amendments to the Reconstruction Finance corporation's railroad-loan provisions.

Section 1, paragraph 14, is rewritten to increase the ICC's power with respect to equipment rentals paid by the railroads. It will hereafter be able to inquire into arrangements for the use of privately owned rolling stock; *i.e.*, "whether or not owned by another carrier." Also, it becomes unlawful for any railroad or express company to enter any contract for the furnishing of protective service against heat or cold, or to continue, after April 1, 1941, as a party to any such existing contract unless the arrangements have been approved by the commission. The commission is authorized to extend the aforementioned April 1, 1941 deadline until Oct. 1, 1941. A new paragraph makes it unlawful to bribe any railroad employee with intent to influence his action with respect to the distribution or movement of cars; while paragraph 18 is amended by adding a new sentence to stipulate that railroads may without commission approval enter contracts with each other "for the joint ownership or joint use of spur, industrial, team, switching, or side tracks." A new paragraph provides "that shippers of wheat, cotton and all other farm commodities for export shall be granted export rates on the same principles as are applicable in the case of rates on industrial products for export"; and the commission is directed "on its own initiative or on application by interested persons, to make such investigations and conduct such hearings, and, after appropriate proceedings, to issue such orders as may be necessary to carry out such policy." Still another provision gives the commission the task of investigation of inter-territorial freight rates. The act makes the beneficial owner liable for freight charges on reconsigned or diverted shipments which are refused or abandoned at ultimate destination. If, however, the reconsignor or diverter has given erroneous information as to the beneficial owner, such reconsignor or diverter is made liable for the charges. It relieves a consignor of liability for charges on collect shipments wherein carriers have failed to carry out instructions to deliver to another party only upon payment of all transportation charges. It further eliminates the equidistant clause and makes remaining provisions—the long-and-short-haul clause and the aggregate-of-intermediates provision—applicable to water carriers as well as to railroads.

Section 5, which covers pooling, unifications, mergers and acquisitions of control, is rewritten to make it applicable to all carriers subject to the act. The commission employs minimum as well as maximum powers over all rates subject to the act. The commission may prescribe through routes and joint rates without reference to the short-hauling of any carrier—if it finds such routes "necessary to provide adequate, more efficient, or more economic transportation." However, "reasonable preference" must be given to the railroad which originates the traffic; and no through route can be established for the purpose of assisting any carrier to meet its financial needs.

State.—Among the states that met in ordinary and extraordinary session, the following were selected, and a brief review of a few of the more important laws passed by them is set forth below:

Economic Legislation.—Kentucky enacted a Fair Trade law for distilled spirits and wine, providing for a fair trade contract with minimum resale prices from resident producers, processors

and vintners to wholesalers; from wholesalers and importers to retailers; from non-resident producers, processors and vintners on brands sold in this state to wholesalers and importers. It also established an Aeronautic commission in the interest of public safety and aeronautic progress, and regulated operation of rural electric co-operative associations organized under laws of contiguous states through a corporation subject to supervision of the Public Service commission of Kentucky. Louisiana enacted an Unfair Sales act banning sales below cost, also an act regulating securities dealings throughout the state. In New York discrimination by labour organizations was prohibited under penalty of not less than \$100 nor more than \$500 to be recovered by the person aggrieved. For a period of one year a corporation may contribute for betterment of social and economic conditions in any community. But no funds paid by a public utility company subject to the jurisdiction of the department of public service for any such purpose shall be deemed a part of the expense of operation of the business of the corporation and chargeable as such. The Fair Trade act, protecting trademark owners, distributors and the public against uneconomic practices in distribution, was amended so that the law does not apply to or fix or limit prices at which any commodity may be sold or offered for sale to the state of New York or any administrative department of the state government, to any political subdivision of the state, any municipality, public corporation or authority created by the legislature, to any college, university or public library, or department of education. It banned untrue and misleading advertising of merchandise, real estate, securities, services, whether through circular, newspaper, magazine or radio; also, omitting to label drugs or labelling them wrongly will make the offender guilty of misdemeanour. Virginia enacted a law to encourage the co-operative marketing of farm products, authorized the incorporation of industrial loan associations for the purpose of making small loans to industrial classes on security and at low rate of interest; prohibited fraud or unfairness in the sale or disposition of securities; amended its Unfair Sales act; provided for regulation of the produce market authorities and regulated outdoor advertising outside of corporate limits of cities and towns in sight of public highways.

Social Legislation.—Kentucky passed a law requiring all applicants for a marriage license to be examined for venereal disease. Another law required that every physician and surgeon or other person, legally permitted to engage in attendance upon a married woman, shall take a blood specimen for serological test for syphilis from such woman as soon as he is engaged to attend the woman and has reasonable grounds for suspecting that pregnancy exists. In New Jersey the division of old age assistance was continued; also, no benefit rights accruing to any individual prior to or after such individual's induction into a branch of the military or naval service, or any organization affiliated therewith of the United States or of New Jersey, shall be prejudiced by reason of the induction into such service for the duration of such service.

Whenever 50% or more persons employed by a board of education shall indicate in writing their desire to participate in any hospital service plan or group insurance plan, or both, and such board of education, by majority vote of the entire board approve such participation, proper disbursing officers of the board empowered to deduct specified fees or premiums from the payment of their salaries. These constitute voluntary payments by an employee. In another statute child labour was regulated so that no minor under 16 may work in a factory. He may, however, engage in agricultural pursuits, although not before 7.00 A.M. or after 6.00 P.M. (if 16–18 not before 6.00 A.M. or after 10.00 P.M.). Combined hours of work and at school of children under

must not exceed a total of eight hours per day.

In New York a law ordering the support of a stepchild by persons legally chargeable therewith up to the age of 17 was passed. Also enacted legislation declaring that whoever prints, publishes or circulates, or causes to be printed, published or circulated any advertisement in pamphlet, card, handbill or newspaper notice to advise on laws of any foreign state, nation or jurisdiction for the purpose of procuring or aiding in procuring divorce, annulment or offering to appear or act as attorney counsel in suit for alimony, divorce or annulment of any marriage in the state or elsewhere is guilty of a misdemeanor. Through another measure it declared that no claim for medical or surgical treatment will be valid and enforceable as against an employer, unless within 48 hr. notice was furnished by the physician attending the treatment, to the employer and the Industrial Commission on forms prescribed by the industrial commissioner.

Hospitalization services by licensed physicians and surgeons under the supervision of the State Corporation commission are authorized in Virginia. Anyone wilfully and maliciously tampering with or tapping telegraph or telephone wires in Wisconsin is guilty of a misdemeanor and is punishable by a fine of not more than \$50 nor more than \$500 or imprisonment not exceeding one year or both. This state also provided for determining prevailing rates of wages and establishing legal work day and legal work week on public works contracts.

Taxation.—Mississippi and Kentucky enacted chain store taxes modeled after the Louisiana type (*i.e.*, determined by the total number of stores—wherever located in the chain). The rates applicable to Kentucky stores range from \$25 to \$200, and to Mississippi stores from \$10 to \$300; the maximum rates in both states apply when there are more than 350 stores in the chain. The Mississippi act grants a concession in reducing the rate by one-fifth for stores in cities with less than 3,000 population. Massachusetts also imposed a tax on the privilege of operating one or more stores or mercantile establishments. The rates applicable range from \$10 to \$300, with maximum rate applying to one or more stores.

Liquid fuel used for propelling vehicles over the highways is not coming within the terms of existing definitions of tax. Motor fuel was made taxable by Alabama, Louisiana, South Carolina and Virginia at 6, 7, 6 and 6 cents respectively. New York allows a refund for gasoline consumed in vessels used exclusively for Sea Scout training. New York continued the two emergency gasoline taxes of 1 cent each for another year. A Mississippi act provided for exemption of certain street-paving materials, added certain definitions, regulated handling of gasoline for export, etc. Virginia required all motor carriers to purchase within Virginia, motor fuel in amount to that necessary for their operation in Virginia. The Virginia tax applicable to gasoline purchases in Virginia for use in aircraft in intrastate commerce, was extended to apply to interstate commerce as well.

The District of Columbia amended its act to exclude from its income all payments of benefits made to or on account of a beneficiary under veterans' legislation.

Kentucky provided that dividends must include distributions of current and accumulated earnings or profits, that stock distributions were not considered as dividends, but they were to be treated as gain from securities when the shareholders secure different interest in the corporation.

The Louisiana income tax rate range lowered the several brackets so that the maximum rate will apply on income (in excess of credits) over \$8,000 instead of over \$5,000. It also provided for a tax of 5% on the net income in excess of \$5,000

derived from the sale or lease of certain unimproved lands, mineral rights, leases, etc.; deleted a provision which required exclusion from gross income of interest received upon obligations of the United States, and excepted from exclusion from gross income interest paid on amounts paid by reason of the death of the insured under a life insurance policy; set up a "percentage of premium paid" method of determining the income tax cost of annuities, and declared that the basis for property converted from personal use to use for profit shall be the fair market value at the time of conversion.

Mississippi prescribed a schedule ranging from 3% to 8% (the maximum applying on all over \$10,000) in lieu of a 3% to 6½% graduation (the maximum applying on all over \$15,000). The act also brought all corporation dividends within the taxable list. A credit for taxes paid on income from sources outside the state was provided for, which further prescribed, however, that if the tax paid in the other state exceeds the amount that would be due in Mississippi, only the latter amount will be allowed as a credit.

New York continued its emergency 1% tax on personal income, and also the tax on unincorporated business. Returns in New York no longer will be required to be made out under oath, but the statute provided that penalties shall accrue for failure to certify, instead of to verify, any return. Another New York act provided for joint returns by husband and wife providing that the income of each, even though one had no gross income or capital gain, may be included in a single return made by them jointly, in which case the tax shall be computed on the aggregate income, and the liability with respect to the tax shall be joint and several; it also provides that a name signed to a filed return shall be prima facie evidence that the return was signed by such individual.

The 3% to 5% South Carolina intangibles tax on income from dividends and interest was repealed. The repeal, however, was made not effective until after the tax for the calendar year 1940 had been collected. Federal employees were brought within the terms of the state income tax laws in Louisiana, Mississippi and Virginia.

California sales tax exempted sales of livestock, poultry, newspapers and publications. These exemptions also apply to the use tax.

Louisiana repealed its general sales tax. New York city continued its retail sales tax and gross receipts tax, and adopted a use tax.

Numerous amendments were made in New York by the first two laws; one that should be noted is the provision exempting sales of fuel oil, ships' stores, etc., for ships not operated within the limits of the city.

Kansas City, Mo., imposed a municipal use tax as complementary to the state sales tax.

(B. WE.)

Leland Stanford Junior University: see STANFORD UNIVERSITY.

Lemons and Limes. The 1940 crops of lemons and limes in the United States were, as reported by the department of agriculture: lemons, all produced in California, 13,430,000 boxes; limes, all produced in Florida, 80,000 boxes. The 1939 production of lemons was 11,963,000 boxes (about 76 lb. net to the box) and the ten-year (1929-38) average was 8,233,000 boxes. The 1939 crop of limes was 95,000 boxes and the ten-year average 28,000 boxes. The Australian crop of lemons in 1940 was 300,000 boxes, about 77% of the 1939 crop and about 75% of the average. The Mexican lime crop in 1940 was reported about 20% less than the record crop of 897,000

boxes in 1939. The table shows United States imports of fresh limes from different countries in the 1939-40, the 1938-39 and in the five-year (1931-35) average of seasons.

U.S. Imports of Fresh Limes from Certain Countries

	1939-40 Boxes	1938-39 Boxes	1931-35 Boxes
Mexico	110,362	104,930	75,601
Dominica, B. W. I.	7,614	6,239	11,718
Jamaica, B. W. I.	3,354	3,402	5,994
Cuba	2,107	1,370	644
Trinidad	0	303	1,345
St. Lucia, B. W. I.	885	1,252	8,079
Dominican Republic	96	507	499
Honduras	28	4,329	193
Haiti	27	0	119
Others	27	37	2,857

The Trinidad and Tobago Lime association asked the government in 1940 to establish compulsory co-operative marketing of lime oil in order to protect the quality of shipments to the United States, which in 1939 imported 134,000 lb. of lime oil.

(S. O. R.)

Leopold III

(1901-), king of Belgium, born Nov. 3, was the son of King Albert I, whom he succeeded Feb. 17, 1934. He was married Nov. 10, 1926 to Princess Astrid of Sweden, who was killed in a motor car accident in 1935. At the first onslaught of the German invasion May 10, 1940 Leopold assumed command of his armies, issued a proclamation to his people and appealed to France and Britain for aid. His unconditional surrender of May 28 caused a storm of indignation among sympathizers with the Allied cause throughout the world, and many of his own subjects branded him as a traitor. The Belgian rump parliament controlled by Premier Hubert Pierlot formally voted to depose him and continue the struggle against the nazis. But later authenticated reports absolved Leopold of treasonous action. One of his staunchest defenders was U.S. Ambassador Cudahy, who declared that the surrender was completely justified. On Dec. 5 the Belgian-American Educational foundation, of which Herbert Hoover is chairman, published a booklet entitled *The Belgian Campaign and the Surrender of the Belgian Army* which branded as false the charge that Leopold had not notified France and Britain of his intention to capitulate. On July 1 Leopold was reported to be under German custody at Laeken castle, Brussels.

Leprosy.

A knowledge of the current incidence of leprosy is so essential to an understanding of the problem created by its presence that records and estimates of its prevalence are continued from year to year. Thus, in the British Isles 78 cases have been observed during the past 30 years. Among those upon which information was obtained there were four which developed apparently within the islands while the remainder originated abroad. Thirty-two of the cases have been seen recently, among which five were under hospital supervision. In Nigeria the number of lepers is estimated at 400,000 among a total population of 24,000,000. In the year 1938 there were 104,000 on record and an estimated number of 170,000 among a population of approximately 50,000,000 scattered through the French overseas territories, though in the province of M'Bomon of French Equatorial Africa it is believed that 9% of the 145,000 population is affected. The provisional incidence recorded in different sections of Brazil ranges from 0.2 to 2.5 cases per 1,000 population, with a total number of 35,241 of which 10,545 are in São Paulo. In Argentina there are about 4,500 cases recorded of which approximately 84% are in the littoral areas of the eastern provinces.

Further observations were made of the great frequency with which leprosy has developed among children born in the Lepro-

saria of Colombia; and studies of the history of a few cases in North America and of their family connections in Canada and the United States have led one author to conclude that hereditary factors play a major role in the propagation of leprosy.

An investigation of the basal metabolic rate (physiological change of energy) among 318 leprosy individuals revealed that 75.4% of them were within the range of normal rates and variations were without correlation between the types or stages of the disease. The appearance and course of leprosy manifestations within the skin has given rise to a nomenclature which includes the designations simple leprids, tuberculids, tuberculo changes, reactive phase (leprosy fever) and the presence of one or another of these manifestations has been variously interpreted as representative of a special form of leprosy, and reflection of the resistance of the tissues to infection. Investigators have concluded from the microscopic structure of the changes in the skin that simple leprids are characterized by commonplace chronic inflammation in which the leprosy bacilli are concentrated mainly in the small peripheral twigs of the nerves. It is also that the existence of gradual transition forms between one type of lesion and another is evidence against the concept that tuberculoid leprosy is a special form of the disease; and the tissue changes which occur in tuberculoid leprosy and in the reactive phase are expressions of allergy (an exaggerated susceptibility, or response of the tissues to the presence of the bacillus and the products of its degeneration) similar to that which occurs in the course of other diseases. It has also been concluded that the reaction induced in tuberculoid leprosy by the injection of Leprolin is an expression of allergy and that this test is therefore specific for leprosy. However, it is to be noted that these interpretations are not universally accepted.

The frequency with which various organs of the body may be affected by leprosy processes is indicated in a review of 1,200 protocols of necropsies performed on leprosy persons. The liver was involved in 811 instances, the spleen in 754, the adrenals in 640, the testis in 582, and the cranial bones in 39. The causes of death of the individuals examined were attributed to tuberculosis in 38% of the number and to diseases of the kidneys in 20%.

Research leading to the detection or diagnosis of leprosy proceeded continuously, and it was reported that a confirmatory test was accomplished by injecting an alcoholic extract of the fresh urine of leprosy patients into the skin. Fever, and a papule of more than one centimetre diameter surrounded by redness at the site of injection occurred in 199 leprosy patients and a smaller papule without redness or fever developed in 91 healthy individuals tested.

The general and specific therapeutic value of the administration of vitamins through diets and by other methods was receiving comparatively widespread interest. The substitution of whole wheat for rice in the diet of a group of East Indian patients during a period of three to four months was accompanied by some relief from pain in their bones and nerves but did not affect the course of the disease. Relief from pain following intra-muscular injection of vitamin B is again reported, and under similar circumstances the value of vitamin C is discounted. The local application of ointments in which the content of vitamin A is naturally or artificially great is believed to have been specifically conducive to the healing of leprosy ulcers.

Among the therapeutic drugs it was found that the intra-dermal administration of histamine is more effective than recognized analgesics in relieving painful complications. Modern compounds of antimony and arsenic such as Fuadin and Soluseptasine are considered of value in treating leprosy fever and ulcers; and degeneration of bacilli in the skin and the progression of the lesions of 50 patients in Thailand (Siam) has been attributed to the injection of diphtheria toxoid (detoxified toxin).

The possibility that toxic principles in some plants used as food may contribute to the development of leprosy was tested by feeding monkeys colocalia for periods of two or more months, and by supplementing the feeding in some instances by injections of sapotoxin. Subsequent inoculation of these animals with leprosy material was followed by the development of leprosy-like nodules at the site of inoculation, bacilli in the ears and nasal secretions, marked changes in pigmentation of the skin and thickening of areas of the face and of other parts of the body, including the nerves.

Renewed efforts to reproduce leprosy in the lower animals were made in one instance by the inoculation of rabbits with cultures of bacteria obtained from leprosy material; and in other experiments by introducing leprosy material into chickens. Some animals developed leprosy-like nodules under the conditions of each set of experiments.

Further observations were made on the similarities in the comparative pathology of leprosy and the leprosy-like disease of rats. Experimental attempts to transmit rat-leprosy from mother to young through the placenta were made by inoculating the females during pregnancy or before conception. Acid-fast bacilli were reported in the tissues of a few of the young which were separated from the inoculated mothers some time after birth. Among inoculated rats fed diets which were deficient in vitamin B₁ content the incubation period of the disease was shorter and it exhibited greater tendency to disseminate through the internal organs. Under the conditions and criteria of these experiments an interrelation also appeared.

active between dietary deficiency in vitamin B₁ and calcium salts.

Lettuce. The area sown to lettuce in the United States in 1940 was reported by the department of agriculture as 162,010 acres compared to 171,420 acres in 1939 and a ten-year (1929-38) average of 156,840 acres. Five crops of lettuce are grown commercially in the United States. The table shows

Lettuce Acreage, Production, Yield and Prices, 1940, 1939 and 1929-38

Crop	Commercial acreage			Yield per acre, crates		
	1940	1939	1929-38	1940	1939	1929-38
Early	41,150	37,000	44,140	173	180	116
Mid early	52,040	70,150	49,400	133	107	110
Intermediate	4,340	4,130	4,850	225	194	195

acreage, yield, production and average prices of these five crops in 1940, in 1939 and in the ten-year average as reported by the department of agriculture. (S. O. R.)

Levene, Phoebus Aaron (Theodore) (1869-1940), U.S. biochemist, was born in Sagor, Russia, Feb. 25, and was graduated from the Imperial Military Medical academy in St. Petersburg in 1891. He went to the United States in 1892 and continued his studies at Columbia university while practising his profession. In 1896 he became associate in chemistry in the Pathological Institute of New York, and in 1905 he joined the staff of the Rockefeller Institute, serving until 1939 when he retired. He was a member of several chemical societies in Europe and the United States as well as the American Philosophical society and the National Academy of Sciences, and was the author of many papers on technical phases of his specialty. He died in New York city, Sept. 6.

Lewis, Francis Park (1855-1940), U.S. ophthalmologist, was born in Hamilton, Canada, May 1877 and was graduated from the New York Ophthalmic hospital in 1877 and later studied in London, Berlin and Vienna. He began practice in Buffalo in 1876. For many years he was head of the New York State School for the Blind at Batavia. He received a gold medal in 1928 for his work in the prevention of blindness and the same year he founded the International Association for the Prevention of Blindness. He died in Brookhaven, N.Y., Sept.

Liberia, an independent Negro republic on the west coast of Africa, bounded N.W. by Sierra Leone and in the hinterland and E. by French West Africa. Area, c. 46,000 sq.mi.; pop. (est. Dec. 31, 1937), 2,500,000. Chief town: Monrovia (cap., 9,700). President: Edwin Barclay; language, official: English; religion: Christian (Protestant).

History.—The constitution of this independent West African state is modelled on that of the United States, which, however, owing to Liberia's faulty administration, was not able to accord its government recognition until 1935. Traffic in slaves is entirely abolished; the "Human Leopard" and other native secret societies have been brought definitely under government control; but, though increasing attention is being paid to health and education, complete absence of railways and inefficiency of such roads as exist act as a brake on progress. A main arterial road was in course of construction in 1940; since 1938 selected students from the high school have been sent to the Achimota agricultural college for training; and the proposal of United States Senator Bilbo for the voluntary colonization of Negroes has, for the time, remained in abeyance. The chief products are rubber and palm kernels; large deposits of iron and other ores are known to exist, but they have not been worked.

Banking and Finance.—In 1938: revenue, \$1,247,626; expenditure, \$983,887; public debt (Aug. 31, 1938), \$1,943,793. Currency: Liberian dollar, exchangeable at a fixed rate of \$4.80=£1 sterling.

Trade and Communication.—Overseas trade, 1938: imports, \$2,241,792; exports, \$1,990,255. Communications, 1938: roads suitable for motor traffic, c. 150 mi.; shipping cleared, 1,761,715 tons.

Agriculture and Mineral Production.—In 1938 (export figures) (in metric tons): rubber, latex, 1,457; rubber, crepe, 1,456; piassava, 5,008; coffee, 892; cocoa, 549; palm kernels, 462,682 bushels; gold, 1,902 troy oz.; ivory, 9,147 lb.; palm oil, 162,757 imperial gallons.

Libraries. During 1940 libraries gave a good deal of attention to the part they can take in the preparation for national defence, and also to the effect of the emergency upon their normal service. In 1917-19 the American Library association collected and spent more than \$5,000,000 for library war service both in the United States and abroad. That experience proved the need for books in the military establishments, not only for recreation and general vocational education, but for military training. Since then the army and navy have maintained library service on a reduced scale. Camp libraries will be established by the war department at government expense under the supervision of the morale division of the adjutant general's office. The present library organization in the navy, directed by the bureau of navigation, will be expanded with the increase of ships and personnel.

The resources of research libraries in the fields of science, technology and economics are likewise of importance. Late in the year the preliminary edition of a *Guide to Library Facilities for National Defense* was published. This was the work of the joint committee on library research facilities for national defence, of which R. B. Downs is chairman, in co-operation with the various libraries represented in the survey. Another obligation of libraries is to provide books that will help in understanding the grave problems confronting the world, and in preserving democratic government and intellectual freedom. (See "The Librarian and the Democratic Process," by Archibald MacLeish, in *A.L.A. Bulletin*, June 1940.)

A meeting of representatives of publishers and libraries was held in New York on Jan. 29 to discuss the proposal of certain pub-

lishers to restrict library discounts to a maximum of 25%. This would seriously affect library book purchases. As a result of the meeting the president of the A.L.A. appointed a special committee whose first step was to work for amendment to state fair trade acts which would exempt libraries from their operation. In April the Field-Crawford act (New York) was so amended. (See *Library Journal*, Feb. 15, 1940, p. 149.) Efforts were being made to obtain books and periodicals needed for research from continental Europe. Shipments from Great Britain, although irregular, were coming through safely. Some libraries want foreign publications as promptly as war conditions permit; others, preferring safety and completeness of periodical files, arranged that their orders be stored abroad until they can be shipped with less risk.

The Harrison-Thomas education bill, which includes provision for federal aid for libraries, did not come up for action by congress as was hoped. Whether or not it could be introduced in 1941 was uncertain. A new copyright bill (S. 3043), drafted by the committee for the study of copyright, was introduced by Senator Thomas (Utah) on Jan. 8, read twice and referred to the committee on patents. Under the new bill, which represents a great advance over present legislation, copyright will exist on creation, and will be for the term of life and 50 years.

In the spring the librarian of congress appointed a committee of librarians, consisting of Dr. Carleton B. Joeckel (chairman), Paul North Rice and Dr. Andrew D. Osborn, to examine and report upon the organization and methods of those divisions of the library having to do with the acquisition of books and their preparation for use. The Library of Congress on Sept. 1 made the first annual award of five fellowships to young scholars on leave of absence from their universities. The fellows will study the library's collections in their particular fields and will aid in handling difficult reference problems.

Bibliography.—The celebration in 1940 of the 500th anniversary of the invention of printing with movable type was an event of special significance for libraries. With the aid of the Carnegie corporation the printing anniversary committee of the American Institute of Graphic Arts (New York) was organized to give advice and suggestions. Exhibitions were arranged in many libraries in all parts of the United States. In New York, for example, 19 libraries and museums co-operated in preparing a series of co-ordinated exhibitions. The celebration was opened by a special convocation at Columbia university on Jan. 19. The Carnegie corporation granted \$35,000 to the Pacific Northwest Library association for the establishment of a bibliographic centre at the University of Washington library in Seattle. Both the Carnegie corporation and the General Education board made grants to colleges in the south and southwest for the purchase of books and for other library purposes. Dr. Albert A. Berg of New York presented a valuable and significant collection of English and American literature in rare editions to the New York Public library in memory of his brother, Dr. Henry W. Berg. The original gift, a collection of nearly 3,500 volumes made by the two brothers, was increased in September by the purchase of the notable collection of 15,000 books and manuscripts from the estate of W. T. H. Howe, for many years president of the American Book company. The special room, designed for the collection and presented by Dr. Berg, was dedicated Oct. 11.

Incunabula in American Libraries; a Second Census of Fifteenth Century Books in the United States, Mexico, and Canada, edited by Margaret Bingham Stillwell, was published by the Bibliographical Society of America in November. The first *Census*, issued in 1919, recorded 13,200 copies; the second *Census* lists 35,247. The Pierpont Morgan library published, late in 1939, a *Check List* of its 15th-century printing containing 1,991 items. A *Short-Title List* of the valuable Chapin library at Williams col-

BERG MEMORIAL ROOM of the New York Public library, designed for the Berg and Howe collections in English and American literature, was dedicated Oct. 11, 1940

lege, compiled by Lucy Eugenia Osborne, was also issued in 1939.

Library Training and Personnel.—The 1939-40 report of the board of education for librarianship (A.L.A.) lists 30 schools of various types accredited by the board as meeting its standards. All are connected with teaching institutions. The total enrolment on March 1, 1940, was 2,159, including 228 advanced and 267 special students. On July 1 Professor Rudolf H. Gjelsness succeeded Dr. W. W. Bishop as head of the department of library science at the University of Michigan. There was little change as regards unemployment among professional librarians; there was perhaps a slight improvement in salaries, but beginning salaries were probably lower than they were a few years before. Except for positions at the top, experienced librarians over 35 years of age were finding it increasingly difficult to obtain positions, or to change positions.

Size of Collections or Statistics of Libraries.—Eighteen libraries contain more than 1,000,000 volumes each according to the latest available statistics: the Library of Congress, 5,828,121 volumes (June 30, 1939); the New York Public library, 4,256,900 volumes (comprising reference department, 2,758,062 volumes; circulation department, 1,406,842 volumes; and Municipal Reference library, 92,000 volumes) (Dec. 31, 1940); Harvard university, 4,159,606 volumes (June 30, 1940); Yale university, over 2,920,000 volumes (June 30, 1940); Cleveland (Ohio) Public library, 2,186,908 volumes (Dec. 31, 1939); Chicago (Ill.) Public library, 1,810,520 volumes (Dec. 31, 1939); Boston (Mass.) Public library, 1,701,166 volumes (1939); Columbia university (New York city), 1,715,263 volumes (June 30, 1940); Los Angeles (Calif.) Public library, 1,601,447 volumes (June 30, 1939); University of California, approximately 1,395,151 volumes (comprising 1,081,151 volumes at Berkeley and more than 314,000 volumes at Los Angeles) (June 30, 1940); University of Chicago, 1,300,785 volumes (June 30, 1940); Carnegie library of Pittsburgh (Pa.), 1,293,549 volumes (Dec. 31, 1939); Cincinnati (Ohio) Public library, 1,258,033 volumes (Dec. 31, 1939); University of Illinois, 1,217,675 volumes (June 30, 1940); Brooklyn (N.Y.) Public library, 1,161,145 volumes (June 30, 1939); University of Michigan, 1,098,197 volumes (June 30, 1940); University of Minnesota, 1,061,965 volumes (1940); Cornell university (Ithaca, N.Y.), 1,063,203 volumes (June 30, 1940).

Such figures are very uncertain standards of comparison because of differences in methods of counting and because public libraries with many branches contain many copies of new and standard books.

Library Buildings.—Plans for the new central building of the

Washington, D.C., Public library, first authorized in 1938, were in shape. The building, which will form a part of the new municipal centre, will have its main façade on Pennsylvania avenue opposite the new National (Mellon) Gallery of Art. It will be necessary to erect the building in sections, and it was hoped that the first unit would be ready for occupancy in 1942. The cost of the entire structure is estimated at not less than \$3,500,000. Construction was begun on a new library for Tulane university, New Orleans, on the Newcomb college section of the campus. The building will cost about \$500,000 and will house the Howard Memorial collection as well as the university libraries. Harvard university began work on a new library for its rare books and manuscripts. The new building, made possible by the support of an anonymous alumnus, adjoins the Widener library and will have a capacity of 250,000 volumes. Other buildings completed or dedicated late in 1939 or during 1940 were: Toledo (Ohio) Public library, main building (cost \$1,000,000); University of Alabama, Tuscaloosa (Amelia Gayle Morgan library; cost \$600,000; capacity 450,000 volumes); Pennsylvania State college (cost \$500,000); Illinois State Normal university (Milner library; cost \$556,000); Chattanooga (Tenn.) Public-University library (cost \$300,000); George Washington university, Washington, D.C. (gift of Abraham Lister; cost \$290,000; capacity 155,000 volumes); Eastern Washington College of Education, Cheney (cost \$286,000; capacity 120,000 volumes); Concord (N.H.) Public library (cost \$250,000).

Librarians.—Claribel R. Barnett, for many years librarian of the United States Department of Agriculture library in Washington, D.C., retired Sept. 1. She was succeeded by Ralph R. Shaw, librarian of the Gary (Ind.) Public library. George F. Bowerman, librarian of the Washington, D.C., Public library since 1904, retired Sept. 30. His successor was Clara W. Herbert, a member of the library's staff since 1907, and assistant librarian since 1920. John Ridington, for 25 years librarian of the University of British Columbia, Vancouver, Can., retired Aug. 31. W. Kaye Lamb, provincial librarian of British Columbia, was appointed to the librarianship. Marilla W. Freeman, librarian of the main library of the Cleveland (Ohio) Public library since 1922, resigned July 1.

Arthur A. Houghton, Jr., was appointed curator of the rare book collection in the Library of Congress on April 1; Alfred D. Baker, since 1928 librarian of the Reading (Pa.) Public library, became director of the Pennsylvania State library and museum at Harrisburg on July 1. John R. Russell was appointed to the librarianship of the University of Rochester (N.Y.). Caroline L. Elliott, for many years reference librarian of the Chicago (Ill.) Public library, died on Jan. 14, aged 82. Arthur L. Bailey, librarian of the Wilmington (Del.) Institute Free library since 1904, died on Feb. 17. Martin A. Roberts, chief assistant librarian of the Library of Congress, died on June 15. His service in the Library of Congress began in the copyright office in 1903; from 1923 to 1927 he was chief of the accessions division, and from 1927 to 1937 superintendent of the reading rooms. John H. Finley, editor-in-chief of the *New York Times*, a trustee of the New York Public library and a devoted friend of libraries died on March 7. In 1939, at the San Francisco conference, the American Library association had elected Dr. Finley to honorary membership in recognition of his services to libraries and adult education. (See also AMERICAN LIBRARY ASSOCIATION.)

Great Britain.—The impact of war on British institutions was immense and on libraries no less than on any others. Before three months of war had passed, the service rendered to the community by public libraries throughout the country had come to be regarded by a great many people as one of the necessities of life and as an undoubted blessing at a time when many other forms of community-service and entertainment had been severely restricted if not actually suspended. As the first year wore on and grave news came from the war-fronts followed by all the preparations for the defence of Britain itself and the gradually increasing air-attack, the public libraries rose to the occasion. Encouraged by government announcements that their services were regarded as of national importance, they expanded their activities in such a way that by the closing months of 1940 they had attained a degree of popularity never before reached. A lively appreciation of the part they could play in the national effort led them to extend the service to meet demands from all directions. The supply of books to civil defence units such as Air Raid Precautions and Auxiliary Fire service posts and depots, and to H.M. forces wherever they were placed, were typical forms of extension work. The promotion of study and play-reading circles, listening (radio) groups, gramophone and philatelic clubs were among other forms. In addition they were continually assisting the authorities by special displays concerning such things as food-growing at home, salvage and national savings, and also by developing to a great extent their information service especially to help citizens with their war-time problems of every kind.

War-damage was done to some libraries, notably those of University college, London, and the Inner Temple, and the destruction of valuable books and buildings cannot be minimized. On the other hand new libraries were opened in many places including Edinburgh, Leeds, Sheffield, Huddersfield, Newcastle, Oxford, London and the London suburbs.

Towards the end of 1939 a Service Libraries and Books fund was instituted by the lord mayor of London and this was responsible for the distribution in 1940 of hundreds of thousands of books and magazines to H.M. forces in every theatre of war at home and abroad.

A notable retirement was that of Dr. Arundell Esdaile, from the post of secretary to the British museum. Happily this retirement did not affect Dr. Esdaile's close association with the library world and profession to which, as president of the Library association for the second year in succession, he was devoting much of his time. (D. C. H. J.)

Lie, Jonas (1880–1940), U.S. artist, a nephew of Jonas L. E. Lie, Norwegian novelist, was born in Norway, April 29. He was taken to the United States by his parents in 1893 and entered the Ethical Culture school in New York from which he was graduated in 1897. While working as a designer of patterns for printed fabrics in Plainfield, N.J., he studied art at night at the National Academy of Design and the Art Students league in New York. As early as 1903 he had won recognition as an artist of distinction. He became interested in the construction of the Panama canal and painted a series of pictures of the work in progress and completed. Although a member of the American Academy of Design, of which he became president in 1934, he was opposed to the policy of its juries which rejected paintings offered for exhibition by non-members and associated himself with a group of independent artists. He resigned the presidency of the academy on Oct. 19, 1939, because the duties of the office made too many demands on his time. His paintings are in the Louvre in Paris, and in the great art museums of the United States. The King of Norway made him a Knight of the Order of St. Olaf and his fellow artists elected him to many of their organizations.

He died in New York city, Jan. 10.

Liechtenstein, an independent but tiny European State, north-east of Switzerland, to which it is united by a customs union. Area 65 sq.mi.; pop. (est. 1940) 11,500. Chief town, Vaduz (capital, pop. 1,710). Ruler: Prince Franz Joseph II, b. 1906, was given ruling authority by his 84-year old uncle, Prince Franz I, on March 30, 1938 and after the latter's death was crowned prince on May 29, 1939. Language, German; religion, mainly Roman Catholic; products: corn, wine, fruit, wood and marble; revenue (1939) 2,099,300 Swiss francs (nearly \$500,000), 31% of which was derived from the sale of postage stamps to collectors all over the world. Lightning War

(blitzkrieg) is the term used to indicate the technique employed by the German army in the warfare in Europe beginning in 1939. The military principles of surprise, mobility and encirclement seeking the total destruction of an opponent are as old as the profession of arms. However, General Hans von Seeckt, the head of the German reichswehr, during the post-Armistice period, advocated the adoption of a lightning war principle as the only basis for employment of the German forces, in view of the limitations placed on the size of the army by the treaty of Versailles. He claimed that a small army well trained and equipped with modern weapons could defeat a near-by enemy before the opponent could mobilize its maximum strength.

Force of circumstances, therefore, brought about the adoption of the lightning war principle.

Subsequently, the theory was applied to the whole conception of war, including the national attitude and preparedness, as well as the conduct of battle.

The characteristics of lightning war relate first, to the nation as a whole, and secondly, to the conduct of battle. To the nation as a whole, these characteristics are: (a) the creation of a monopoly of power within the state for the purpose of waging intense warfare; (b) the preparatory "war of nerves"; (c) secrecy of preparations; (d) surprise in opening hostilities.

To the conduct of battle these characteristics are: (a) creation of opportunities for the encirclement and destruction of enemy forces; (b) co-ordination of air, mechanized and motorized units with the older ground forces to exploit these opportunities; (c) utilization of speed and range of air and ground motors to concentrate forces for surprise blows of great intensity; (d) utilization of small combat teams operating against weak spots of the enemy defences to extend the battle in depth and to create openings for the advance of speedy mechanized units; (e) secrecy in conception of the battle plan, training of all individuals and units and concealments in the production of new weapons, including combat aviation, the heavy tank and mobile artillery; (f) application of the principles of economy of force, terrain features and the historic role of infantry to assure victory.

DIAGRAM of a typical German break-through, illustrating the tactics used at Sedan May 13-14, 1940, and showing areas prepared by aircraft and artillery before advance of a Panzer (mechanized) division on a railroad junction. All enemy pillboxes have been mopped up, the regular infantry advances and dug trenches to hold the area against counterattack

The creation of a monopoly of power within a state for the purpose of waging intense warfare is a prerequisite for the employment of the technique of lightning war. All political, social and economic elements within the state are co-ordinated to gain the maximum effort in support of the national war aims.

The preparatory "war of nerves" creates apprehension in the ranks of a potential enemy. False rumours, defeatist propaganda, encouragement of belligerent minorities, spies and fifth columnists are allied activities which weaken enemy morale.

Secrecy of preparations for war approximates the appearance of peacetime pursuits. Cultivation of large fields strategically located and designed for actual use as wartime airports, distribution of industrial plants in agricultural areas to gain disposition of industry, the construction of superhighways and strategic railroads, all these, classified as peacetime cultural or social advantages, are actual preparations for eventual combat.

Surprise applies not only to the national effort but also to the conduct of battle. As to the nation, secrecy and surprise are employed to hide the real objectives or the intended opponent. As to the conduct of battle, secrecy and surprise mask the extent and size of forces engaged and methods to be employed in combat.

The creation of opportunities for the encirclement and destruction of enemy forces depends upon complete success of the preliminary steps leading to hostilities. Between the early and first battles in the World War of 1914-18, large offensives were initiated with large-scale artillery preparations followed by the slow movement of the infantry-light artillery mass. The size of armies, numbered in millions, the strength of defensive weapons principally the machine-gun and field artillery, and the strength of organized defensive positions resulted in enormous losses. These circumstances remained true until the advent of the tank near the close of the war, and further, because aviation had not been developed as aerial artillery support for ground forces. Germany employs air, mechanized and motorized forces in close co-ordination with the older infantry-light artillery forces. All arms are designed and used to approximate "mobile weapon

A FIRST PRINCIPLE of the German blitzkrieg as practised in 1940 is the rapid break-through of mechanized forces

In 1940, the dive-bomber weakened enemy morale and destroyed old artillery and ground defences. Parachutists and air infantry landed in rear areas to join local sympathizers and hold tactical features such as bridges until main forces arrived. The time interval between the old artillery preparations and the arrival of ground forces was eliminated by moving up heavy armoured and mechanized units, delivering enormous fire power in support of motorized infantry. Air forces attacked hostile air fields, air-ground installations, reserve locations, supply bases, communication lines and civilian centres. Armoured and motorized infantry with air support exploited gaps to great depth until organization and destruction were complete.

Victory resulted from the speed and range of air and ground forces permitting concentrated forces to launch surprise blows of great intensity.

Although small combat teams operated independently of the main body, each supported the principal mission. They were employed to create openings for the advance of the speedy mechanized units. Their success should not be overrated nor considered a decisive factor. They played an important but preliminary role in the final plan calling for use of larger forces.

Combat engineers and mobile supply services up front with armoured and mechanized columns is a development essential to the sustained action of these weapons. Heavy German columns were, as far as practicable, self-sustaining in their composition. Each contained all essential arms, supplies and aerial support to accomplish the main mission.

The conception of the battle plan, the training of individuals and units and the production of weapons insured that the enemy would be unprepared to meet these conditions.

Lightning war emphasizes the principle of economy of force. The maximum effort was delivered with the main force against the principal objective. Speedy victory was gained with less aggregate loss of life to both sides. In 1914-18, for a long period, battle was based upon a policy of attrition-relative losses. Lightning

war proves that the objective can be gained in a short period. It reintroduces the principles of war of the Napoleonic era applied, of course, with great speed and larger numbers.

From a tactical viewpoint, commanders grasped opportunities created by small independent forces and pushed through large forces which gained great depth and accomplished great destruction. Information in 1940 indicated that just such a situation existed on the French-Belgian border north of Sedan, where the German high command rushed through large mechanized forces which eventually reached the coast along the Somme river.

Outstanding in this lightning war is the historic role of infantry. This arm is charged with the main combat in battle and its action decides the final issue. Its mission is the principal mission of the entire force. Marches of 20 to 25 mi., repeated two and three days in succession exploited opportunities created by shock action of armoured and mechanized air and ground forces.

Blitzkrieg or lightning war has captured the imagination of the world and suggests that some "secret weapon" is responsible for the spectacular successes. There appears to be no "secret weapon" other than the German monopoly of power within the state for the purpose of waging intense warfare and conducting battle by continuous co-ordination of all arms to secure surprise, mobility and the eventual encirclement and destruction of the opponent. (See also AIR FORCES; ARMIES OF THE WORLD; EUROPEAN WAR; MUNITIONS OF WAR; STRATEGY OF THE EUROPEAN WAR; TACTICS IN THE EUROPEAN WAR.) (H. A. DR.)

Lime. The popular conception of lime is primarily as a building material, but this is not the case; of the 4,254,000 short tons produced in the United States in 1939, only 24% was used in the building industry, and even in predepression days, when building was much more extensive, the proportion was well under one-half. Agriculture used 9%, and of the remainder 35% went to chemical, 18% to metallurgical and 16% to refractory uses. Of the total sales, about one-third is as hydrated lime and two-thirds quicklime. In Canada production dropped from 674,100 short tons in 1929 to 320,700 tons in 1932, increasing to 550,342 tons in 1939; with a 10% increase in prospect for 1940. (G. A. Ro.)

Limestone: see STONE.

Lindley, Ernest Hiram (1869-1940), U.S. educator, was born in Paoli, Ind., Oct. 2, was graduated from the University of Indiana in 1893, and became an instructor there the same year. In 1917 he became president of the University of Idaho and in 1920 he was elected chancellor of the University of Kansas, a post he held with a short intermission until he resigned in 1939. He died Aug. 21 on board a steamship on the way from Shanghai to San Francisco.

Linen and Flax. War, in the first five months of 1940, closed to the flax and linen consumers of the world every customary source of supply but the British Isles. As Holland and Belgium followed Scandinavia, Russia, Poland, Latvia, Estonia and Lithuania into closed trade area, the principal world consumers, United States and Great Britain, turned anxiously to plans for finding new fields of production. The British government offered cash bounties of £2 for each acre of grassland plowed up for flax. Canadian producers, with an increase of 100% in 1940 over 1939 in flax acreage, were shipping substantial amounts to Scots and Irish mills, and New Zealand's 1939 production from 100 acres showed gratifying results, including a world record in one section. In ten English counties and in

Northern Ireland and Scotland, small acreages were started for extension of flax cultivation in the local areas. In Peru, the ancient land of the Incas, experimental plantings were under way with efforts by the Peruvian government agricultural school to purchase seed in the United States. In the United States itself, increasing quantities were grown in Oregon and cultivation in Pennsylvania was proposed. In the south, experimentation by engineers at the Georgia School of Technology developed a method of removing wood from flax fibre by machinery and for spinning the fibre on equipment now used in cotton mills, which was expected to enable southern farmers to grow flax at a profit. The research was conducted at the request of the Tennessee Valley authority to provide a new cash crop for the south, alternating with cotton and tobacco.

The potential supply of flax was of immediate concern to military equipment suppliers. Webbing and strappings for parachutes, bomber guns, etc., are customarily made of linen threads because of their superior strength when wet. In the United States, supply officers of both the army and navy were experimenting with materials of other fibres, cotton particularly, to determine whether they would serve in place of linen for all practical purposes.

In civilian use for linens, an interesting situation developed in Ireland. To provide American dollars for purchase of armaments and food supplies, the British government ordered the linen mills to concentrate their civilian linen production on export. The British board of trade reduced the supply of linen goods to domestic retailers to 50% of 1939 quantities. But high prices deterred American buying and resulted in an unprecedented unemployment situation in Ulster. The percentage of unemployed rose from 18.4% in March 1940 to 39.1% in September, with little relief in sight. In October it was reported that merchants and manufacturers were far from satisfied with the board of trade quota for domestic trade and felt that better overseas buying would develop only when prices could be reduced by decreased overhead costs resulting from increased production of home market goods.

A reflection of this situation was seen in the reports of the first eight months' business in 1940 between Northern Ireland and the United States, as reported by *Foreign Commerce Weekly*, issue of Nov. 9, 1940. The value of the linen fabrics exported increased from \$3,722,055 in 1939 to \$4,408,515 in 1940, but the volume decreased from 3,534,075 lb. to 2,932,975 lb. The average value per pound in 1939 was \$1.05 and in 1940 was \$1.50. Another indication of the trend away from luxury products is the change in proportion of plain and trimmed handkerchiefs exported. In 1939, 48,701 of the linen handkerchiefs exported were trimmed with embroidery or drawn work. In 1940 this had been reduced to 13,432, although the total export of handkerchiefs had remained fairly constant: 4,608,958 in 1940 against 4,695,904 in 1939. Linen napkins showed a sharp increase in quantity, about one and a half times the 1939 shipments. This last may be an indication that the announced promotion plans of the Irish linen guild, as emphasized at the end of 1939 and beginning of 1940, were showing some results in the U.S. market. The American women may have responded to the suggestion that linen tableware is a more prized possession than the rayon and cotton combinations that were threatening to usurp the more expensive linen product.

Of historical interest is the part played by the Irish linen industry in the manufacture of war materials for Great Britain during 1940. On government work, was 20% to 25% of the linen industry, many working on cotton or cotton and linen mixtures for tent duck, canvas cotton for respirator haversacks, cotton denim to make one-piece service uniforms, and linen dowlas, used for bedding and mattresses. This last also is used for stretchers. Parachute cord and tapes, aeroplane cloth and damasks of various

kinds were among the other products. Linen thread for ball cordage, parachute webbing for gas masks and electrical equipment employed 1,800 people in one plant alone. Some thread, however, substituted hemp for flax, especially in stretcher canvases and awnings. In general, there was one great difference between the war demands of 1940 and those of 1914-18: In 1940 the coarse fabrics were in demand. Before, most of the production was for the fine linen fabric used on aeroplane wings. Today metal planes at least conserved that much flax. This change affected most of the fine goods mills as represented by the Ulster section of the industry, but they were reported to have adapted their equipment satisfactorily to the new requirements.

Lions Clubs, International Association of. The International Association of Lions clubs is an association of service clubs composed of business and professional men, founded by Melvin Jones and formed in Chicago, Ill., on June 7, 1917. The 1939-40 international convention was held in Havana, Cuba.

There are approximately 4,000 Lions clubs in the association with a total membership of 150,000 in eight countries: Canada, China, Colombia, Costa Rica, Cuba, Mexico, Panama, United States.

Lions clubs are nonpolitical, nonsectarian. Their purpose is to recognize community needs, and meet those needs by independent effort or through co-operation with other agencies. Their activities are supervised by club committees, under eight classifications: boys and girls; citizenship and patriotism; civic improvements; community betterment; education; health and welfare; safety; sight conservation and blind. During the 1939-40 fiscal year, Lions clubs reported 50,304 separate activities to their international office.

The association's official publication, *The Lion Magazine*, is issued monthly. International president for the 1940-41 term is Karl M. Sorrick. Headquarters, directed by Secretary-General Melvin Jones, are at 332 South Michigan avenue, Chicago, Ill. (M. Jo.)

Lippincott, Joshua Bertram (1857-1940), U.S. publisher, was born in Huntingdon Valley, Pa., Aug. 24, the son of Joshua B. Lippincott, founder of the publishing firm of J. B. Lippincott & Co. He was educated at the Episcopal academy in Philadelphia and the University of Pennsylvania. He left college in 1875 to work for his father, and received training in all the branches of the publishing business. He became vice-president of the company in 1886 and president in 1911, serving in that capacity until 1926 when he became chairman of the board of directors. He was a director of the American Philosophical society and several Philadelphia institutions. He died in Philadelphia, Jan. 19.

Liquors, Alcoholic. The United States is the country of greatest production and consumption of potable spirits. Whisky is the predominant beverage. In the fiscal year ending June 30, 1940, about 99,000,000 gal. of whisky were produced. The apparent consumption of all whiskies was 114,732,000 gal. Of these 104,189,000 gal. were of domestic origin and 10,543,000 gal. were imported, largely from Scotland and Canada. The consumption of gin was 13,130,000 gal.; of rum, 2,430,000 gal. (of which 345,000 gal. were imported) and of brandy 2,450,000 gal., of which 882,000 gal. were imported. Most of the whisky is produced in the United States, next are Scotland, Can-

a and Ireland. Considerable quantities are turned out in Australia and a few other countries.

Gin or geneva had its origin in Holland. English gin, which was first a copy of the Dutch product, is known to the trade generally as London dry gin. It dominates not only the British but the general world market. However, the production of gin in the United States is far greater than in England.

Brandy, or more specifically "grape" brandy, was recognized for long time as almost an exclusive product of France. In particular, the product originating from the Charente district, and which one is entitled to the designation "cognac," has been considered a standard for this type of beverage. However, a quite fine quality of grape brandy has been produced in California.

World conditions have brought about considerable changes in the world supply of alcoholic liquors. Exports of brandy and cordials from France and gin from Holland, have practically ceased. For the time, Britain is maintaining its exports of scotch and gin, at least to the United States. (A. J. LI.)

Literary Prizes.

Following is a partial list of the awards made in 1940.

International.—NOBEL PRIZE: Not awarded.

United States.—AMERICAN CIVIL LIBERTIES UNION (\$50 each in addition to royalties): Philo Higley, *First Freedom*; Noel Houston, *According to Law*. AMERICAN HISTORICAL ASSOCIATION PRIZES: GEORGE LOUIS BEER PRIZE (\$240), Richard Heathcote Heindel, *American Impact on Great Britain, 1898-1914*; HERBERT BAXTER ADAMS PRIZE (\$200), John Shelton Morris, *Church and State in Russia*; JOHN H. DUNNING PRIZE (\$100), Richard William Leopold, *Robert Dale Owen*. AMERICAN TRACT SOCIETY PRIZE BOOKS: First prize (\$1,000), Samuel Marinus Zwemer, *The Glory of the Manger*; second prize (\$500), Clarence E. N. Macartney, *Christianity and the Spirit of the Age*; third prize (\$250), Wick Broomall, *The Holy Spirit*. JOHN ANISFIELD AWARD (\$1,000): E. Franklin Frazier, *The Negro Family in the United States*. ATLANTIC NOVEL PRIZE (\$10,000): Anna Fedorova (Mrs. Antonia Riasanovsky), *The Family*. CARL M. HENNENBERGER MEMORIAL MEDAL (Southeastern Library association), Harry Lee, *Fox in the Cloak*. BROSS FIFTIETH ANNIVERSARY PRIZE (\$5,000, Bross fund, Lake Forest university): Harris Franklin Rall, *Christianity*. COMMONWEALTH CLUB OF CALIFORNIA AWARDS TO CALIFORNIA AUTHORS: Gold medals: John Steinbeck, *Grapes of Wrath*, and Franklin Walker, *San Francisco's Literary Frontier*. Silver medals: Agnes Newton Keith, *Land Below the Wind*; Robin Lamson, *Death Loses a Pair of Wings*; Donald Culross Peattie, *Flowering Earth*; Mary Virginia Provines, *Eight Heritage*; William Saroyan, *The Time of Your Life*. DIAL PRESS AWARD FOR TEACHERS (\$1,000): Sophia Belzer Engstrand, *Miss Munday*. ROCK STREET THEATRE'S (Charleston, S. C.) NATIONAL PLAYWRIGHT AWARD (c. \$200): Albert Carriere, *Danbury Fair*. DODD, MEAD-REDBOOK PRIZE NOVEL (\$10,000): Harlow Estes, *Hildreth*. DODD, MEAD RED BADGE DETECTIVE STORY: David Keith, *A Matter of Iodine*. JULIA ELLSWORTH FORD FOUNDATION CHILDREN'S BOOK CONTEST (\$2,000): Lucy Embury, *The Listening Man*. FRIENDS OF AMERICAN WRITERS' MIDWESTERN PRIZE (\$1,000): Elgin Earl Groseclose, *Ararat*. GUGGENHEIM FELLOWSHIPS (c. \$400 each): Herman J. Broch, Ward Allison Dorrance, John Dos Passos, Fred Frankenberg, Lewis Galantieri, Alfred Kazin, Edwin M. Lanham, Andrew Nelson Lytle, Delmore Schwartz, Christine Weston, Howard Wolf. OWNEY HOWARD AWARD (Playwrights' company): Robert Ardrey, *HOWELLS MEDAL FOR FICTION* (American Academy of Arts and Letters): Ellen Glasgow. ALFRED A. KNOPP FELLOWSHIPS (\$1,200 each): Wallace M. Wally, Wheaton J. Lane, Henry Ladd Smith. LEAGUE OF AMERICAN WRITERS FELLOWSHIPS TO EXILED WRITERS (\$100 each): Oskar Maria Graf, Will Schaber, Bodo Uhse. ROY COOPER MEGRUE PRIZE (\$500, Dramatists' guild): Howard Lindsay and Russel Crouse, *Clarence Day's Life with Her Made into a Play*. NATIONAL BOOK AWARDS FOR 1939 (American booksellers association): Elgin Earl Groseclose, *Ararat*; Antoine de Saint Exupéry, *Wind, Sand and Stars*; Dalton Trumbo, *Johnny Got His Gun*; John Steinbeck, *Grapes of Wrath*. NATIONAL INSTITUTE OF ARTS AND LETTERS GOLD MEDAL: Robert Emmet Sherwood. NATIONAL POETRY CENTER MEDAL OF HONOR: Jessie Belle Rittenhouse, *Moving Tide*. JOHN NEWBERY MEDAL (most distinguished children's book, American Library association): Frances Daugherty, *Daniel Boone*. NEW YORK DRAMA CRITICS' AWARD: William Saroyan, *The Time of Your Life*. NEW YORK HERALD TRIBUNE CHILDREN'S SPRING BOOK FESTIVAL CONTEST (\$250 each): Lucy Herndonockett, *That Mario*, and James Douglas Adams, *Cap'n Ezra, Privateer*. HENRY MEMORIAL AWARDS (best short stories): first prize (\$300), Stephen Vincent Benét, *Freedom's a Hard-bought Thing*; second prize (\$200), Roderick Lull, *Don't Get Me Wrong*; third prize (\$100), Edward Ravill, *The Kill*. PARENTS' MAGAZINE MEDAL: Mrs. Sidonie Matsner Uenberger, *We, the Parents*. POETRY (magazine) PRIZES (\$100 each): Annette Sewell Davis, Kenneth Fearing, Robinson Jeffers, Louis MacNeill, Ariel Rukeyser, David Wolff. POETRY SOCIETY OF AMERICA: medal, draic Colum; first prize (\$100), Helen Morrow, *Marcus Aurelius in hemia*; second prize (\$50), Harold Vinal, *Impossible Rendezvous*. LITZTER PRIZES (\$1,000 in each class): fiction, John Steinbeck, *Grapes of Wrath*; drama, William Saroyan, *The Time of Your Life*; history, Carl

Sandburg, *Abraham Lincoln: the War Years*; biography, Ray Stannard Baker, *Woodrow Wilson: Life and Letters*, vols. vii. and viii.; poetry, Mark van Doren, *Collected Poems*. SOCIETY FOR THE LIBRARIES at NEW YORK UNIVERSITY GOLD MEDAL: Katherine Anne Porter, *Pale Horse, Pale Rider*. SOUTHERN AUTHOR'S AWARD (\$100, Southern Women's National Democratic organization): Hamilton Basso, *Days Before Lent*. TEXAS INSTITUTE OF LETTERS SILVER MEDAL: Dora Neill Raymond, *Captain Lee Hall of Texas*. YALE SERIES OF YOUNGER POETS: Norman Rosten, *Return Again, Traveler*. YOUNG PEOPLE'S CHOICE AWARD (Pacific Northwest Library association): Dell J. McCormick, *Paul Bunyan Swings his Axe*.

Great Britain.—A. C. BENSON MEDALS (Royal Society of Literature): Frank Laurence Lucas, Andrew Young. A. E. MEMORIAL AWARD (£100): Patrick Kavanagh. JAMES TAIT BLACK MEMORIAL PRIZES (c. £250 in each class): biography, David Charles Douglas, *English Scholars*; fiction, Aldous H. Huxley, *After Many a Summer*. CARNEGIE MEDAL (best juvenile book, Library Association of Great Britain): Eleanor Dooley, *Radium Woman*. HAWTHORNDEN PRIZE (£100): James Pope-Hennessy, *London Fabric*.

Canada.—GOVERNOR-GENERAL'S AWARD: Franklin Davey McDowell, *The Champlain Road*.

Bulgaria.—BULGARIAN MINISTRY OF EDUCATION: fiction, Fanny Popova-Mutafova, *The Master of Boyana*, and Ivan Karanovsky, *Suntown*; drama, first prize, Kyril Kristov, *The Master and the Devil*; second prize, Nicholas Ikononov, *Khan Tatar*; third prize, G. Karaivanov, *Winged Horseman*; history and travel, Angel Karalichev, *The Land of the Bulgarians*; poetry, first prize, Latchezar Stanchev; second prize, Emanuel Dimitrov.

France.—BEST TRANSLATION OF THE YEAR (10,000 fr.): Pierre Francois Caillé, *Autant en Emporte le Vent* (translation of Margaret Mitchell, *Gone With the Wind*). GONCOURT PRIZE: not awarded. GRAND PRIX LITTÉRAIRE DE L'EMPIRE: François Bonjean. PRIX DU ROMAN POPULISTE: Jean Paul Sartre, *Le Mur*. PRIX FEMINA-VACARESCO: Bertrand de La Salle, *Alfred de Vigny*. RALPH B. STRASSBURGER PRIZE (\$1,000): Max Lambert, *Les Etats Unis Bilan*.

Italy.—PREMI FONDAZIONE FUSINATO: Riccardo Chiarelli, *Mamma Italia*, and Ettore Fabbietti, *Vita Eroica di Antonio Locatelli*. PREMI SAN REMO: Italian authors, Ernesto Caballo, Bruno Fattori, Giampaolo Callegari, Marcello Pilati, Enrico Ribulsi, Cesare Bonacassa; foreign author, Alessandro Marcu. PREMIO MUSSOLINI OF THE CORRIERE DELLA SERA: Quirino Maiorana.

Portugal.—CAMOENS PRIZE (20,000 escudos): John Gibbons, *I Gathered No Moss*.

Spain.—CORTINA AWARD: Jose M. Peman, *Trilogía Dramática*. SPANISH NATIONAL PRIZE FOR LITERATURE: García Mercadal, *Aire, Tierra y Mar*. (See also CHILDREN'S BOOKS.)

BIBLIOGRAPHY.—For historical information, see: Charlotte E. Murray, *Famous Literary Prizes* (1934); Bessie Graham, *Famous Literary Prizes and Their Winners* (1939); *Books Abroad* (University of Oklahoma). (M. A. W.)

Lithuania, Baltic country of north-central Europe, N. of Poland. Area 22,959 sq.mi. (as of July 1, 1940); population (Jan. 1, 1940) 2,879,070. Chief towns: Vilnius (Vilna, capital, 207,750 approx.); Kaunas (still the real seat of government, 152,365).

History.—Territorial disintegration had begun in 1939 with the cession of Memel (March 22), and the forced withdrawal of all Lithuanians from the city in November.

On Oct. 10, 1939, Lithuania signed a pact with the U.S.S.R. by which she gained most of the long-coveted city and district of Vilnius, the ancient capital (Vilna, with total population of 457,500), and granted to soviet Russia rights of garrisoning certain forces in the country.

Precariously she maintained independence until, in June 1940, Premier Antanas Merkys went to Moscow "to conduct negotiations" and was joined by the foreign minister, Juozas Urbysys, on June 10. A month later Lithuanians went to the polls to vote on the question of inclusion in the soviet union (July 14). A number of protective arrests helped to quiet opposition, the proposition won, and on Aug. 3, 1940, Lithuania was accepted by the soviet supreme council as the 14th republic of the soviet union. Some 82,000 additional people in the Vilna district were added to the new republic.

President Smetona fled the country, and some 12,000 Jews and war refugees sought to get to Japan in an attempt to continue on to Dutch New Guinea. The Lithuanian ministers in London and Washington went on Aug. 3 deprived of citizenship and their prop-

 "THE PIED PIPER OF MOSCOW" had an assistant in persuading the three small Baltic republics to apply to the U.S.S.R. for admission July 21, 1940, according to Elderman of the *Washington Post*

erty confiscated by the new Lithuanian government. The new order of things was not recognized by Great Britain, which held Lithuanian ships in its harbours. Nor was it recognized by the United States, which froze all American assets of the overthrown government and people. Nevertheless, early in September the U.S.S.R. forced the closing of American diplomatic and consular offices in Lithuania as well as in the other Baltic states.

Education and Religion.—(1938-39) 2,335 primary schools, 298,429 scholars; 27 secondary schools, 2,633 scholars; 56 gymnasias, 16,906 scholars; university at Kaunas, 3,041 scholars. Part of the university was moved on Jan. 15, 1940, to Vilna.

Roman Catholics, 80.5%; Jews, 7.3%; Protestants, 9.5%; Greek Orthodox, 2.5%.

Banking and Finance.—Budget est. 1939: revenue, 341,785,274 litas; expenditure, 341,785,274 litas.

BIBLIOGRAPHY.—J. Krikščiūnas, *Agriculture in Lithuania* (Kaunas, 1938); *The Baltic States* (London, 1938). (F. D. S.)

Little Entente. The Little Entente, a defensive alliance of Czechoslovakia, Rumania and Yugoslavia, against Hungarian aggression, ended without any formal declaration in 1939 by the extinction of Czechoslovakia, perhaps the leading partner in the entente.

Of the two remaining states, which, in an informal way, seemed inclined to continue their defensive co-operation against Hungary in 1939, Rumania in 1940 was forced to submit herself to dismemberment by Hungary; the existence of the defensive alliance with Yugoslavia was of no avail to Rumania because Hungary did not declare war, but received a part of Rumanian territory by negotiation and arbitration, although under duress and violent protest on the part of Rumania. On the other hand, Hungary did not press her territorial claims against Yugoslavia, and at a visit

of the Hungarian foreign minister, Count Stephen Csaky, to B grade in Dec. 1940, a permanent treaty of peace and friendship was concluded between the two countries. In such a way Little Entente, which had come into being on Aug. 14, 1920, the conclusion of a Czechoslovak-Yugoslav defensive treaty alliance and by a similar treaty between Czechoslovakia and Rumania on April 23, 1921, followed by a Rumanian-Yugoslav treaty on June 17, 1921, came definitely to an end in 1940. (also CZECHOSLOVAKIA; HUNGARY; RUMANIA; YUGOSLAVIA.) (H. Ko.)

Livestock. The greatest change in the world's supply of meat animals in 1940 was in swine, a condition resulting from war interference with the normal processes of production and international trade. The supply of meat from hogs could be increased enormously in a single year, more rapidly than from cattle or sheep or any other practical source. As a consequence, countries at war and in urgent need of larger food supplies had deavoured to increase hog production, while in peaceful nations pork production created a surplus that could not be shipped because of war restrictions on international trade. In Canada, 1940 hog production broke all records. The spring pig crop of 5,100,000 head was 39% above 1939. The fall pig crop in 1940 was 4,500,000 head compared to 3,700,000 in 1939. Canadian output of pork products in 1940 (preliminary estimate) was 1,035,000,000 lb., not including lard.

Although the British government greatly increased its standard order for weekly shipments of pork to the United Kingdom, Canada had a surplus. In the United Kingdom the food minister raised the price of fat hogs July 1, 1940, from \$19.12 per 100 lb. dressed weight to \$21.13, marking a rise of \$7.06 per 100 lb. since prices were fixed Oct. 13, 1939. This price was reduced to \$19.12 Oct. 1, 1940. In France the government urged farmers to greater efforts in pork production, but here, as in other European countries, a shortage of feed and the necessity of using feed grains for food for refugees and an army of occupation kept production down. In Denmark, normally a large exporter of pork to the United Kingdom, hog numbers Nov. 1, 1940, were estimated at 2,500,000 compared to 3,230,000 a year earlier and it was reported that scarcity of feed would cut the number to 2,000,000 (report of the office of foreign agricultural relations, U.S. department of agriculture).

Germany apparently had approximately a normal hog supply of 29,100,000 head Jan. 1, 1940, including the Sudeten and Austria but in five important exporting countries supplies were down 13% in 1940 to 13,569,000 head (Hungary, Yugoslavia, Ireland, Denmark and Lithuania). In the United States curtailed European markets, an abundance of supplies and an unfavourable hog-corn price ratio caused substantial decreases in the spring and fall crops. Argentina also had a surplus because of lack of European outlets. (See Hogs.)

European countries generally made strenuous efforts to maintain dairy herds in 1940 owing to a shortage of butter and milk and despite scarcity of feeds. The number of cows and heifers two years old or over in 18 European countries, representing 70% of the European herds outside Russia, was reported as 42,084,000, an increase of about 10% since 1930. In Italy the marketing of beef cattle was put under government control Sept. 19, 1940. A previous regulation had directed cattle growers to reserve 30% of animals over 276 lb. for government use. In the United Kingdom the food ministry emphasized quantity production rather than quality production of beef in feeding operations. In the United States the total number of all cattle increased about 2,000,000 in 1940 and was approximately 70,800,000 head Jan. 1, 1941. The peak was 74,300,000 head in 1934, but the drought in that year

in 1936 was followed by a reduction in numbers to a low of 5,100,000 in 1938 (see CATTLE; DAIRYING). A number of European countries suppressed livestock and other agricultural statistics as a war-time measure. Neither comprehensive nor very recent figures were available. The U.S. office of foreign agricultural relations reported that there were about 10,000,000 head in German dairy herds Jan. 1, 1940, compared to 9,962,000 a year earlier. In 1940 figures were available from France, the United Kingdom, the Netherlands, Hungary, Sweden and Eire, but 1939 reports showed dairy herds of 8,732,000 (cows only) in France; 3,885,000 in the United Kingdom; 1,926,000 in Sweden; 1,566,000 in the Netherlands; 1,345,000 in Eire; 1,103,000 in Hungary. Denmark had 1,618,000 Jan. 1, 1940, compared to 1,625,000 a year earlier. No reports were available of what disposition the German army of occupation may have made of the prize purebred dairy herds on the Channel islands of Jersey and Guernsey where the famous Jersey and Guernsey breeds originated. Herds of purebred Jerseys and Guernseys, however, are so numerous in the United States and the United Kingdom that the Channel island stock could readily be replaced, American breeders pointed out. The world picture of livestock and livestock products in 1940 was a sharp contrast of plenty and the rationing of meat, dairy products, wool clothing and even leather shoes in Europe, while in the Americas, Australasia and South Africa there was an abundance of these supplies, even an unusable surplus of many. There was no material change in sheep production in 1940, except the universal problem of finding available markets for mutton and wool. For work animals, see HORSES. (See BACON; BUTTER; CHEESE; MEAT; MILK; SHEEP.) (S. O. R.)

Livestock Shows: see SHOWS.

Local Government: see MUNICIPAL GOVERNMENT.

Madge, Sir Oliver (Joseph) (1851-1940), English scientist. was born in Penkridge, England, June 12, and died at his home in Amesbury, Aug. 12. For a biographical sketch see *Encyclopædia Britannica*, vol. 17, p. 293.

London. Life in London during 1940 fell into two clearly differentiated portions, with mid-August as the dividing point. In the first, "behind-the-lines" conditions prevailed, and in spite of the black-out, the ubiquitous shelters and sandbags, the effects of evacuation, the presence of A.R.P. officials in full training and of soldiers, and latterly the home guard drilling in the parks, life went on much as usual. The winter had been severe, but the summer was very fine, and in their leisure hours Londoners thronged the parks or dug strenuously in their allotments and gardens. Several theatres and many cinemas were open, and there were even a few sporting events. In the second period, when the largest and commercially the most important city in the world, with a record of nearly 20 centuries of life unhindered by the foreign invader, was assailed from the air by an enemy armed with all that science and ingenuity could devise, London accepted her "front-line" position with all that that entailed. The A.R.P. services sprang into efficient action, and the civilians, while maintaining the work, business and efficiency of their city, proved that though her walls, her palaces, her churches and her homes might be reduced to rubble, her spirit could never be broken. During the whole period, though disorganization of communications was frequent and sometimes serious, no essential service was more than temporarily impaired. No cut was made in necessary expenditure on the social services; and public and private premises, except when irreparably damaged, were repaired as speedily as possible—latterly with the help of the royal engineers and the

pioneer corps. In that way thousands of business people determined to maintain their regular occupations were enabled to do so with delays of only hours. It was even possible to make a few additions to the Green Belt, but the improvements foreshadowed in the Bressey report of 1938 were perforce postponed. Among other works, the completion of Waterloo bridge with its proposed "roundabout" in the Strand, the development of the south bank of the Thames, the memorials to King George V and to Jellicoe and Beatty, and the University of London buildings were also held up.

In March, A. Emil Davies, economist and a leading member of the London County council, succeeded Mrs. E. M. Lowe as chairman, and in May Herbert Morrison, M.P., following his appointment as minister of supply, resigned the leadership and was succeeded by Charles Latham, chairman of the finance committee. The rate for 1940-41 showed a reduction of 3d. at 7s. 6½d., and the ratable value a slight increase at £62,880,000. The March estimates were £45,447,708 on maintenance account (including £1,250,000 as special provision for contingencies), and £7,794,000 on capital account; of the £9,407,500 budgeted for civil defence government grants covered all but £1,069,693. Owing to treasury restrictions and the wartime necessity to control capital outlay capital expenditure allowed for was only little over half that of the previous year; no provision was made, however, for the reparation of war damage, though an undertaking that such expenditure would be met if need arose was given. Shelters, black-out, etc., at County hall cost £18,000 (about £6,500 ranking for grant); staff evacuation, with hire of premises and incidental expenses, cost £39,675, the annual extra cost of maintenance being estimated at £23,000. The water supply was protected against air attack at a cost of £390,736, and the council's institutions, homes, casual wards, etc., at £40,000.

London had taken early steps to defend herself against attack. In April 1939, two regional commissioners, Sir Ernest Gowers, chairman of the coal commission, and Admiral Sir Edward Evans, had been appointed. In May 1940 they were joined by Captain D. Euan Wallace, M.P., as senior commissioner, and at the end of September two special commissioners were added: H. Willink, K.C., M.P., to supervise the care of the homeless, and Sir Warren Fisher, a former head of the civil service and lately commissioner in Manchester of the northwest area, to co-ordinate and facilitate reconstruction. In October Sir Edward Evans was put in charge of air raid shelters and Dr. Mallon, warden of Toynbee hall, was appointed by the minister of food as adviser on the catering problems connected therewith. A fund for the relief of distress caused by enemy action in London was opened by the lord mayor on Sept. 10. Contributions poured in from every part of the world in such profusion that on Oct. 28 its scope was extended to cover the whole of the United Kingdom and Northern Ireland. By the middle of December it had reached nearly £1,700,000.

Apart from one or two "alarms" in the early days of the war no sirens wailed in London till June 25, but from Aug. 23, when the "blitz" began, until Dec. 2 there was no 24-hour period without at least one "alert"—as the alarms came to be called—and generally far more, nine having been registered on three separate occasions. In the hundred days, Aug. 23 to Nov. 30, there were 368 alerts, and the nights of Nov. 3 and 28 were the only occasions during this period on which London's peace was unbroken by siren or bomb. After the first week of September, though night bombing on a large scale continued, the large mass attacks by day, which had proved so costly to the enemy, were replaced by smaller parties coming over in successive waves; on occasions forces consisting of as many as 300 to 400 machines would cross the coast by daylight and split into small groups, and a few planes would succeed in penetrating London's outer

Below: PICCADILLY CIRCUS STATION of the London subway during night air raids of autumn 1940

ences. Air-raid damage was widespread, and the raider was a respecter of persons or places. Hospitals, clubs, churches, museums, residential and shopping streets, hotels, public houses, theatres, schools, ancient monuments, maternity homes, newspaper offices, embassies and the zoo were bombed. While some of the poorer and more crowded suburban areas suffered severely, the mansions of Mayfair, the luxury flats of Kensington and Buckingham palace itself—which was bombed four separate times—fared little better; but such was the determination of the citizens and the high degree of efficiency attained by the A.R.P. and medical services that casualties, though sometimes heavy, at the time approached the estimates that had been made before the war broke out and only a fraction of the hospital and ambulance provision that had been made was ever requisitioned.

The following curtailed list identifies some of the better known places in inner London that have been damaged by enemy action. Some are a total loss; others are already under repair with little outward sign of the damage sustained:

Besides Buckingham palace, the chapel of which was wrecked, and Guildhall (the six-centuries old centre of London civic ceremonies and of great architectural beauty), which was destroyed by fire, Kensington palace (the London home of the earl of Devonshire, governor general of Canada, and the birthplace of Queen Mary and Queen Victoria), the banqueting hall of Eltham palace (dating from King John's time and long a royal residence), Lambeth palace (the archbishop of Canterbury), and Holland House (famous for its 17th century domestic architecture, its political associations, and its art treasures), suffered, the latter severely. Of the churches, besides St. Paul's cathedral, where at the time were five unexploded bombs in the immediate vicinity and the roof of which was pierced by another that exploded and shattered the high altar to fragments, those damaged were Westminster abbey, St. Margaret's Westminster, Southwark cathedral; fifteen Wren churches (including St. Bride's, Fleet St.; St. Lawrence Jewry; St. Magnus the Martyr; St. Mary-at-hill; St. Dunstan in the East; St. Clement (Eastcheap) and St. James's, Piccadilly). St. Giles, Cripplegate, and St. Mary Woolnoth, also in the city, were damaged, while the Dutch church of Austin Friars, dating from the 14th century and covering a larger area than any church in the city of London, St. Paul's alone excepted, was totally destroyed. Islington parish church, rebuilt Our Lady of Victories (Kensington), the French church by Leicester square, St. Anne's, Soho (famous for its music), All Souls', Langham place, and Christ Church in Westminster Bridge road (whose tower—fortunately saved—commemorates President Lincoln's abolition of slavery), were among a large number of others. Over 20 hospitals were hit, among them the London (many times), St. Thomas's, St. Bartholomew's, and the children's hospital in Great Ormond st., as well as Chelsea hospital, the home for the aged and invalid soldiers, built by Queen Victoria. The famous places damaged include the palace of Westminster and Westminster hall, the County hall, the Public Record Office, the Law Courts, the Temple and the Inner Temple library; Somerset house, Burlington house, the tower of London, Greenwich observatory, Hogarth's house; the Carlton, Reform, American, Savage, Arts and Orleans clubs; the Royal College of Surgeons, University college and its library, Stationers' hall, the M.C.A. headquarters, Toynbee hall and St. Dunstan's; the American, Spanish, Japanese and Peruvian embassies and the buildings of the *Times* newspaper, the Associated Press of America, and the National City bank of New York; the centre court at Wimbledon, Wembley stadium, the Ring (Blackfriars); Drury Lane, the Queen's and the Saville theatres; Rotten row, Lambeth Walk, the Burlington arcade and Madame Tussaud's. Stores whose names and goods are known all over the world were damaged in

Oxford street, Regent street, Piccadilly, Cheapside and elsewhere, and the new police station in Saville row was nearly demolished. According to official figures air-raid casualties in London to the end of October amounted to about 27,200, of which some 11,200 were fatal.

(L. H. D.)

London University.

At the beginning of the second year of war there was little new to be said about the university. The colleges remained scattered, though some minor geographical adjustments had been made. The wisdom of dispersal, however, could no longer be doubted, and it was remarkable how well the university functioned under difficulties which its organization in colleges made it possible to overcome. The number of students for degree examinations was not greatly below normal, and in engineering the number was slightly higher than usual. The quality of the work was noticeably good, evidence of the serious attitude of students in a time of national emergency.

Students, technical and non-technical, were interviewed by the university joint recruiting board and allocated to employment suitable to their training, experience and personality, in the services or in industry. Many were reserved from military service for the purpose of completing a technical or scientific qualification. An increasing number of teachers was engaged on work of national importance, but the remaining staff continued the basic work and, in addition, was taking an active interest in educational schemes connected with the services. In many ways the colleges were making important contributions, direct and indirect, to the war effort.

(S. J. W.)

Loree, Leonor Fresnel

(1858–1940), U.S. railroad president, was born in Fulton City, Ill., April 23, and died in West Orange, N.J., Sept. 6. For a biographical sketch see *Encyclopædia Britannica*, vol. 14, p. 393.

Los Angeles,

county seat of Los Angeles county, largest U.S. city west of Chicago, and fifth in the nation, has an area of 442 sq.mi., a 1940 census population of 1,504,277 (1,024,479 in 1900), a gain of 250,744 in a decade. The population of the county is given as 2,277,211. Mayor: Fletcher D. Bowron.

Fatalities from automobile accidents in 1940 were again high (above the 1,000 mark for the county), despite extraordinary endeavours for safety. John Dockweiler was elected district attorney over Buron Fitts, who served the county 12 years.

Tourists again brought much "imported wealth" to southern California. Building permits placed Los Angeles second only to New York, with upwards of \$63,000,000 for the first ten months. The 1940 fiscal year saw 85,027 carlots of produce unloaded in Los Angeles market. Lake Mathews (named for William Burgess Mathews), containing 30,000,000,000 gal. of water for 13 cities of the metropolitan district, was formally dedicated Nov. 17. Opening of the All-American canal to Imperial valley (Oct. 13), after six years of construction, is significant for all southern California. The beautiful William Mulholland memorial fountain, in commemoration of the man who pioneered the work of developing an adequate water supply, was dedicated Aug. 2 at Los Feliz boulevard and Riverside drive.

The 41st Encampment of the Veterans of Foreign Wars (Aug. 26) brought 60,000 visitors. The centenary of the appointment of the first Catholic bishop of California (Most Reverend Francisco Garcia Diego y Moreno) and the convention of the Confraternity of Christian Doctrine brought distinguished prelates and culminated (Oct. 13) in the city's largest religious gathering, in Los Angeles Coliseum.

New airliner service without change to New York was inaugurated Aug. 20, using interchange of equipment of United Air Lines and Western Air Express. Work progressed rapidly on the more adequate 640-acre airport at Inglewood. Ten coast-to-coast airliners daily bring mail to Los Angeles. Extraordinary activity was seen in the aviation industry as an integral part of national defence, with a backlog of unfilled orders amounting to hundreds of millions of dollars. Demand for petroleum and gasoline was heavy.

The open-air theatre for the University of California at Los Angeles will be completed for the 1941 commencement. The Hancock Foundation building for biological research added significantly to the equipment and resources of the University of Southern California. At Occidental college two new dormitories, Haines hall and Wylie hall, were dedicated Nov. 29. (R. D. Hu.)

Lothian, Philip Henry Kerr, 11TH MARQUESS OF (1882–1940), British diplomat, was born April 18 and was educated at the Oratory school, Birmingham, and New college, Oxford. He went to South Africa in 1905, serving in various capacities for the government until 1908, when he became editor of *The State*, a South African publication. He returned to London in 1909 and became editor of the *Round Table* the next year, holding the post until 1916, when he became secretary to Lloyd George, then prime minister. He was made director of United Newspapers, Ltd., in 1921, chancellor of the Duchy of Lancaster in 1931 and parliamentary undersecretary for India in the same year. When a vacancy occurred in the British embassy to the United States he was appointed ambassador in April 1939. His duty in the United States was to obtain all possible assistance for the British in the way of ships, warplanes and munitions. His last speech, read by an associate the night before he died, was a plea for assistance, with the assurance that the British with the help of the United States could successfully combat what he called the gangster menace that was endangering liberty throughout the world. He died in Washington, Dec. 12.

Louisiana, first state carved from the Louisiana purchase, is one of the west south central states of the United States of America. It was admitted to the union in 1812 and is popularly known as the "Pelican state" or "Creole state"; area 48,506 sq.mi.; population according to U.S. census of 1940, 2,363,880, of which 980,439 are urban, or 41.5%. Capital, Baton Rouge, 34,719. The only cities with larger population are: New Orleans, 494,537; Shreveport, 98,167. Of the total population of 2,101,593 in 1930, 1,318,160 were whites; 776,326 Negroes; 2,064,517 native born; 37,076 foreign born.

History.—In the presidential election official returns for the popular vote of Louisiana gave Roosevelt 319,751 and Willkie 52,446.

The public scandal exposures of 1939 provided the chief issue in the state Democratic primary election of Jan. 16, 1940. In the hotly contested campaign Governor Earl K. Long led the administration machine forces, while the other four gubernatorial candidates ran upon reform platforms. The first primary was indecisive and a second was held on Feb. 20, in which Sam Houston Jones defeated Earl K. Long for governor and the Long machine which had dominated state politics for 12 years was overthrown.

The new anti-Long legislature met on May 13 in regular 60-day biennial session and on the following day Sam Houston Jones was inaugurated as governor. A comprehensive program of reform legislation was enacted, designed to eliminate political graft and corruption, ensure economy and efficiency in the public service and prevent any recurrence of political dictatorship or public scandal. The chief reform acts provided for: a reorganized state ad-

ministrative system, centralizing authority and responsibility in a few key officials and boards; a revised state fiscal system to prevent extravagance and misuse of public funds; the elimination of recognized abuses in the electoral system; a state civil service system to end political jobbery and ensure efficiency in the public service; a revised state tax structure, repealing the unpopular sales tax and increasing taxation on those citizens and corporations most able to bear it; the creation of a criminal commission with sweeping powers to ferret out and punish persons guilty of peculation in handling public funds; the clarification of certain sections of the Civil Code and Code of Practice; the correction of defects in criminal law and procedure revealed

during the scandal investigations; and the removal of schools and other public institutions from political control and placing them on a basis of economy and efficiency.

Other notable progressive movements of 1940 were: continuation of federal and state investigation of public scandals; expansion of the industrial program; construction of additional farm-to-market roads as part of the state highway system; completion of the combined highway and railway bridge over the Mississippi at Baton

GOV. SAM JONES of Louisiana, Democrat, elected April 16, 1940

Rouge; enlargement of the soil conservation program; extension of the rural electrification system; establishment of additional trade schools and parish libraries; development of new petroleum fields; continuation of federal flood control; and the location of important federal military training camps within the state.

State officers: Sam Houston Jones, governor; Mark M. Mouton, lieutenant governor; James A. Gremillion, secretary of state; A. P. Tugwell, treasurer; L. B. Baynard, auditor; Eugene Stanley, attorney-general; John E. Coxe, superintendent of education.

Education.—Education is free and compulsory for all children. Separate schools are maintained for whites and Negroes. Over 500,000 pupils are enrolled in elementary and high schools, 10% of whom are in private and parochial schools.

Charities and Correction.—The state maintains the following: charity hospitals at New Orleans, Shreveport, Lafayette, Pineville, Independence and Monroe, under the social security program; insane hospitals at Jackson and Pineville; a tuberculosis hospital at Greenwell Springs; schools for the deaf and blind at Baton Rouge; training school for feeble-minded at Alexandria; soldiers' home at New Orleans. There are also numerous private and endowed hospitals and orphanages. The state maintains three prison farms for adult offenders, and separate training institutes for male and female juvenile delinquents.

Banking and Finance.—There are about 120 state and 33 national banks, with total assets of \$500,000,000, deposits of \$450,000,000 and capital, surplus and reserves of \$50,000,000. The state's bonded debt is approximately \$150,000,000; assessed valuation of property \$1,400,000,000; annual state budget \$60,000,000.

Agriculture, Manufactures, Mineral Production.—Cotton, sugar cane, corn, rice, sweet and Irish potatoes, and hay are the chief staple crops, valued at nearly \$200,000,000 annually. How-

er, severe freezes in January and a late, cold spring injured sugar cane and excessive summer rainfall damaged the cotton and rice crops, reducing the 1940 value of these three staple crops to \$24,000,000 below that of the preceding year. Dairying, stock-raising, citrus fruit culture and truck and vegetable gardening are also important agricultural activities. Louisiana ranks first among the states in lumber production. Nearly 1,700 industrial establishments, with 76,000 employees, receiving \$60,000,000 annually in wages, produce commodities valued at \$580,000,000.

Principal manufactures are lumber and other wood products, oil and other cotton-seed derivatives, rice products, paper, refined sugar, petroleum products, carbon-black, chemicals, ice, canned vegetables and sea-foods and tropical clothing. Petroleum, natural gas, salt and sulphur are the chief mineral products, with combined annual value of \$175,000,000. (W. Pr.)

Lumber. Production in the United States for 1940 was estimated at 28,000,000,000 board feet, or about 10% above that of 1939 and considerably above the 21,646,000,000 board feet reported by the United States census bureau for 1938. The leading species of lumber, in order of rank, continued as follows: southern pine, Douglas fir, ponderosa pine, oak, white pine, hemlock, red gum, cypress and maple. Altogether, about 100 species of trees enter prominently into commercial lumber production. Southern pine was produced from 21 southern and southeastern states of which seven cut more than 500,000,000 board feet each. One of the first states to be lumbered, North Carolina, produces more lumber than any other southern state. This is evidence of the recuperative and reproductive powers of southern pine. Douglas fir is cut throughout the Rocky mountain and Pacific coast states, but Washington and Oregon contribute about 95% of the total value of this species. Ponderosa pine is cut principally in Oregon and California. Lumber production is still well below the pre-depression level.

The European war and the subsequent development of a national defence program were responsible for a marked increase in lumber requirements for the nation. During 1940, it is estimated that approximately 1,500,000,000 board feet of lumber were produced for army and navy requirements. Much of this lumber was used for the construction of cantonments for troop housing; also for tanks in power plants, boxes for the shipment of munitions, food, etc., lockers, furniture and many miscellaneous items. In addition, the U.S. Housing authority arranged to build considerable defence housing.

It is estimated that the entire needs for the defence program approximate from 4,000,000,000 to 5,000,000,000 board feet over a period of two to four years or more. Increase in lumber demand for the defence program has affected industrial activity and the general use of lumber and timbers for construction throughout the country. Upward readjustment of prices resulted from this increased demand. This elevation of prices also resulted in a number of sawmills increasing their output by going on night shifts.

Lumber exports fell sharply due to the war in Europe. Normally the bulk of U.S. exports go to Great Britain. It is estimated that total lumber exports for 1940 were about 20% below those for 1939. Nearly all items of lumber exports, including logs, timbers, boards, cross-ties, and many other forms, suffered, with the exception of box shooks. On the other hand, substantial quantities of construction lumber, principally Douglas fir and southern pine, were purchased by the United Kingdom and shipped for war purposes.

It is believed that losses incurred by curtailment of the European market will be offset by gains in the Central and South American lumber trade. Exports of lumber and logs gained somewhat, but did not offset the losses due to the export situation.

The use of timber connector construction showed an appreciable gain in expansion during 1940. This was particularly true as applied to U.S. housing authority purchases, the construction of CCC camps, various defence projects, harbour and dock improvements, and railroads. Timber connector construction was widely extended to Canada and Great Britain for defence construction.

Simplified practice recommendations defining U.S. standards for softwood lumber were revised and published in 1940 by the U.S. bureau of standards. (N. C. B.)

Other Countries.—The timber industry underwent further drastic changes

in 1940. Poland and Finland, both leading timber export countries, were, of course, out of the picture at the beginning of the year, Poland having been overrun by Germany in the earliest stage of the European war, and Finland being later in conflict with Russia. Norway, another exporting country, though less important, was then involved, and subsequently Denmark, Holland and Belgium (all timber importing countries) were occupied by the Germans. Sweden, maintaining her neutrality, was alone in a position to export, but in her case opportunities were extremely limited since all her leading buyers, apart from Germany, were cut off.

When the Russo-Finnish conflict ended, Russia added greatly to her timber resources. The first estimates were that, as a result of the cession of territory to Russia, Finland lost saw mills and woodworking establishments with an aggregate annual production of 200,000 standards of timber, together with important forest areas and valuable yards at the shipping ports of Viipuri and Trangsund.

Later in the year Latvia, Estonia and Lithuania, which all had a substantial timber export business, became absorbed in the soviet union.

Great Britain, chief timber importing market, cut off from her usual European sources of supply, drew increasingly from the empire, notably Canada, and from the United States, and also developed greatly the felling and conversion of home-grown timbers. Forestry workers from Newfoundland were drafted into England and Scotland for work in the woodlands.

All countries ceased the issue of detailed timber trade statistics, so that comparisons are impossible. Aggregate figures in Great Britain, however, showed that timber imports in the first eight months of 1939—eight months of peace—totalled £27,090,265, and in the corresponding period of 1940 under war conditions totalled £23,201,657. The figures were not a true reflection of the market (freight rates had been much higher); even so, they indicate in a measure how well imports to Great Britain were being maintained.

The British government's timber control department was further developed. The timber controller was in the position of being sole buyer for the country, and of controlling disposal of the national timber supplies. Wartime stocks were being apportioned by means of quotas, and stockholders themselves were disposing of the wood to consumers only under licence. Canada, too, appointed a timber controller in 1940, the operations of his department, of course, being confined to the timber trade of the dominion itself. (See also FORESTS.) (N. F.)

Lundeen, Ernest (1878–1940), U.S. senator from Minnesota, was born in Beresford, S.D., and was graduated from Carleton college in 1901 and from the law school of the University of Minnesota in 1904. He was admitted to the bar in 1906 and began practice in Minneapolis. He served two terms in the Minnesota legislature and was elected to congress in 1916 on the Farmer Labor ticket, serving one term during which he voted against entering the war and against conscription. He was again elected in 1932, and after serving two terms was elected to the senate. He was killed in an aeroplane accident near Lovettsville, Va., Aug. 31.

Lutherans. The year 1940 was a year of great anxiety and responsibility for Lutherans throughout the world, on account of the war in Europe. Early in the year the invasion of Finland involved the whole population of that country in acute distress, in which the whole Lutheran church shared, since about 98% of the people of Finland are members of the Lutheran church. The policies of the government involved all church interests in Germany where a large percentage of the population is Lutheran. So with many members of the Lutheran church in Poland and other small countries involved in the war. Then followed the invasion of Denmark and Norway, known as Lutheran countries, and, later, portions of France, with a substantial Lutheran membership.

One result of these political disturbances was a condition which made communications between European and American groups practically impossible and led to the indefinite postponement of the Lutheran World convention, appointed to meet in Philadelphia in May 1940.

Another result of the European war was to place the responsibility for the support of foreign missions, previously supported by the European churches, upon the Lutherans in America. Some of the largest Protestant missions in the world are among these missions which have come under the care of the Lutherans in America. Such missions are located chiefly in Africa, China and India.

The year 1940 was a year of important conventions for the Lutheran bodies in America. The meetings of the United Lutheran

church in America, the American Lutheran church and the American Lutheran conference were the most significant, since they dealt with the questions of the union of all Lutheran bodies in America and with enlarged co-operation in common tasks, especially emergency provision for the foreign missions left without support on account of war in Europe. All Lutheran bodies in America recorded gains in membership and in contributions in 1940. (W. H. G.)

Luxembourg. Formerly an independent state, it is south-east of Belgium, with which it was connected by an economic union in 1922. The state was first created by the Treaty of London, April 19, 1839, and was ruled after the World War of 1914-18 by the Grand Duchess Charlotte. Area, 999 sq.mi.; pop. (1937) 300,732; chief town, Luxembourg (cap., 59,760); language, Luxembourgian (idiomatic), and (officially) French and German; religion, mainly Roman Catholic.

In 1939, just before the outbreak of the European war, Luxembourg received assurances of respect of her neutrality from Germany and France, and these assurances were observed for more than seven months. But on May 10, 1940 German troops suddenly swept into the country and occupied it, and the Grand Duchess fled, eventually to the United States. On Aug. 14 the constitution was declared void by Dr. Simon, German civil administrator, use of the terms "Grand Duchy" and "State of Luxembourg" was prohibited, and Luxembourg was soon incorporated into the German reich. (S. B. F.)

Lynchings. As 1940 drew to a close it was evident that no diminution of lynchings was in sight, as compared with 1939, despite the assertions of southern governors, senators and congressmen during debate on federal anti-lynching legislation that the states could and would prevent lynchings and punish lynchers. As contrasted with the five lynchings of 1939, it was found that as of Dec. 14, four lynchings had taken place in 1940; a fifth death, it was agreed should be classified as a lynching unless some evidence to the contrary developed, while at least four other cases bore many of the earmarks of lynchings but were classified as subject to further investigation.

These were the findings of a meeting at Tuskegee institute on Dec. 14 of representatives of various agencies which compile and publish lynching statistics. Two of the cases agreed upon as being lynchings occurred in Georgia, one in Tennessee and one in Alabama. The fifth case, which the conferees agreed should be classified as a lynching in the absence of any refutation of the evidence gathered to Dec. 14, occurred in Alabama. No one of the 1940 lynchings was punished or even arrested.

There was evident during 1940 a growth of manifestations of the lynching spirit, aside from these cases in which the victims came to their death, against members of unpopular religious and political groups. This tendency became more marked as tension over the European war and fear of U.S. involvement became more widespread.

Most publicized of 1940's lynchings was that of Elbert Williams at Brownsville, Tenn., in June. Williams and several other highly respected, law-abiding citizens, including a minister of the gospel, a business man and a farmer, went to the Haywood county courthouse to ascertain the requirements they and other Negroes would have to comply with to vote in the 1940 presidential election. Shortly afterwards mobs went to the homes of members of the committee late at night. Williams was taken to a swamp and his badly mutilated body was found a few days later floating in a near-by river, tied to a log. The Negro minister and other members of the delegation were forced to flee for their lives and as the year closed were still refugees from Brownsville. No action

had been taken, it is believed, to bring the lynchers to justice by the state of Tennessee or the authorities of Haywood county though it is charged the members of the mob were well known. Investigation by the National Association for the Advancement of Colored People having resulted in securing the names and evidence against ten members of the mob, which included two peace officers. The federal department of justice was still investigating the case as 1940 ended.

The Gavagan-Fish-Wagner-Van Nuys-Capper anti-lynching bill was passed by the house of representatives by a vote of 252 to 131 on Jan. 10, 1940. Opposition by southern senators and the weakness of the majority leadership of the senate combined to prevent a vote on the bill in the upper house of the congress though 72 of the 96 senators were pledged to vote for the bill.

Of the four authenticated lynchings in 1940, three were of Negroes and one a white man. These four deaths brought the total of lynchings in the United States, since 1882, to 5,128; 1,451 white and 3,672 Negro. In 99.2% of the lynchings no punitive action was taken by the state authorities against the lynchers. (See also NEGROES [AMERICAN].) (W. H.)

MacBride, Ernest William (1866-1940), British biologist, was born in Belfast, Ireland, Dec. 12. He was educated in Queen's college, Belfast, St. John's college, Cambridge, and London university. He was made a fellow of St. John's college in 1893 and received the Walsingham medal for biological research in the same year. In 1897 he became Strathcona professor of zoology at McGill university, Montreal, and remained in Canada until 1909. In 1913 he was elected professor of zoology in the Imperial College of Science, South Kensington, and was retired in 1934 as emeritus professor. He was one of the most eminent scientists of Great Britain and attracted wide attention in 1935 by challenging the Darwinian theory of evolution. He died in Alton, Hampshire, Nov. 19.

McClellan, George Brinton (1865-1940), U.S. publicist, son of Gen. George B. McClellan, was born Nov. 23 in Dresden, Saxony, while his parents were visiting in Germany. He was graduated from Princeton university in 1886, was admitted to the bar in 1892 and in the same year was elected president of the New York Board of Aldermen. In 1894 he was elected to congress and served five terms. He served as mayor of New York city from 1903 to 1909. He was professor and lecturer in Princeton university from 1908 until 1931 when he was made professor emeritus. He died in Washington, D.C., Nov. 30.

McGarrah, Gates W. (1863-1940), U.S. banker, was born in Monroe, N. Y. In 1898 he became cashier of the Leather Manufacturers national bank, New York city, and four years later was made its president. From 1923 to 1926 he was a director of the Federal Reserve bank in New York and in 1927 he was appointed to the Federal Reserve board in Washington. When the Bank for International Settlements was organized in Basle, Switzerland, he was nominated as the representative of the U.S. banks on its board and was its president from 1930 to 1933. After his return to the United States he was elected to the board of the New York Bankers Trust company. He was recognized as one of the ablest U.S. bankers and was a director of several corporations. He died in New York city on Nov. 5.

Machinery and Machine Tools. The war and the U.S. defence program had in 1940 a far-reaching effect on the machine tool industry. Normally machine tool builders do a business of only \$100,000,000

SKILLED MACHINE OPERATOR working on a torpedo part in the U.S. navy's torpedo station at Alexandria, Va., in 1940

NEW U.S. MACHINE which tapers holes in bases of six propeller blades at one time

ABOVE: WORKMEN ARE SMOOTHING DOWN a large screw for a U.S. warship in Bremerton, Wash., navy yards as the U.S. defence program got under way in 1940. Elsewhere in the United States an estimated 500,000 workers found jobs in munitions and related industries during the year

RIGHT: THIS HUGE HYDRAULIC TESTING AND FORGING PRESS demonstrated in 1940 can exert a pressure of 3,000,000 lb.

year. In 1940, however, the volume skyrocketed to \$425,000,000 because of the urgent needs of munitions and aeroplane makers. The inevitable result of preoccupation with getting out bigger production was to reduce or defer development programs. Even so, there were almost as many announcements of new and materially improved units during 1940 as during 1939. This is explained, in part, by the large number of new accessories and attachments that were made available.

As in 1939, most of the development during 1940 was in the field of equipment designed for producing fine surface finishes. One of the interesting developments in this field was the announcement early in 1940 of an improved hydraulic universal grinder which incorporates a new mechanical speed changing device in the headstock which eliminates the need for variable-speed motors. An infinite number of work speeds are obtained between 55 and 500 r.p.m. merely by rotating a small handwheel in front of the unit. The table feed on this machine is actuated hydraulically from a circuit which supplies pressure on both sides of the piston. Feed rates are infinitely variable from 3 to 240 in. per min.

Also made available for the first time in 1940 was a cutter grinder for automatically regrinding hobs and formed milling cutters in sizes up to 10 in. diameter and 12 in. face. Like many of the other machines developed, this machine features an hydraulic table drive which affords accurate control of traversing speed. With this drive, the length of stroke can be controlled to suit the face of the work and speed of traverse can be adjusted at any time, even while the machine is in operation. It has been found that the life of hobs between grinds can be increased materially by giving the faces of the teeth a finer finish. This is accomplished by slowing down the table speed on the last circuit of indexing.

In the high-production field, a 34-ton grinder built for snagging three surfaces, the bottom and both ends, of automotive cylinder blocks is of interest. Three operators put five blocks through this machine per minute. Four grinding heads are used, each pair being supported by a massive column. Upon the left-hand column are mounted two heads in line, each carrying an abrasive member for snagging the bottom surface of the block. The first head takes a roughing cut, while the second takes a lighter finishing cut. The two heads on the right-hand column are mounted one above the other so that the grinding members are parallel. A rotary work carrier having six stations is provided, each station carrying a quick-clamping fixture. During operation, a cylinder block is loaded by hand from a conveyor to a fixture, with the bottom surface up, and is carried beneath the first two grinding wheels. After leaving the second wheel it automatically is indexed 90°, so that when passing through the opposed wheels on the right-hand column the two end surfaces are ground simultaneously. Following this operation the block automatically is reindexed to its original position and manually unloaded to a conveyor.

A number of specially designed machines were placed on the market during 1940 for use in the production of such ordnance items as shells, bombs and fuses. These developments cover a wide range, from the simple, single-purpose machine to the multiple-spindle, multiple-tool machine designed for high-production operations. Also, in connection with these operations, carbide cutting materials, especially those suitable for machining steel, were finding increasing applications. Sometimes the increase in production rate made possible by these materials eliminated the necessity for installing additional equipment in a limited floor space. This is particularly helpful when delivery of new equipment necessarily is delayed because of the increased load being carried by the machine tool industry.

Production of military aircraft and aircraft engines at ever increasing rate naturally led to the development of a number of interesting units for operations either unnecessary on former types of aircraft, or done by hand when only a few parts were to be made. Among these developments was an hydraulic stretching press with 600 tons capacity for forming sheet metal by forcing a die upward into the work while the two edges of the sheet are restrained in clamps. Basically, the machine is made up of two separate units of similar design, each of which has two cylinders, two plungers and a common inclinable table. Each unit also has two motor-driven clamp supports with suitably swivelling sheet clamps. The unit quickly can be set up for a variety of shapes, such as are required for fuselage work.

In the aircraft engine field, a machine built during 1940 for contour milling of high nickel-chrome master rods for a foreign aircraft engine is of particular interest. The machine also is suitable for articulated rods and other contour milling operations of similar nature by merely changing the master cam located beneath the work-table fixture plate. The heat-treated master rod is located on the fixture through two drilled holes in the large and small bosses. After pressing a button, an automatic cycle involving four distinct movements, mills the contour of the rod with all cuts blended together. Both the cutter head and the table slide are operated by hydraulic cylinders, the cutter head advancing or retreating with the master cam outline. Another hydraulically operated unit developed during 1940 was a variable speed propeller twisting machine which corrects inaccuracies in pitch of 7- to 14-in. wide aeroplane propeller blades. Use of the machine permits the blades to be forged very nearly to the finished size, so that only a small amount of stock need be removed during the machining operation. It will maintain the angle of the twist upon the longitudinal centre line of the work piece. The machine may be adjusted to make twists between various lengths and will operate in either direction to increase or decrease pitch of the blade.

A mass production machine entirely new in principle and design, developed for cutting straight-tooth bevel gears, such as those used in automobile differentials, washing machines and textile machinery, was another one of the principal developments during 1940. Known as the "Revacycle" this machine provides an exceptionally fast method of cutting straight bevel gears, these are both roughed and finished in one operation with a single disk cutter. The cutter disk has a number of radially arranged roughing blades followed by a number of similarly arranged finishing blades, with a gap between the last finishing and the first roughing blade. This cutter is mounted on a reciprocating slide and as the cutter rotates in engagement with the gear blank it moves along the tooth, the action being similar to that of a milling cutter. As the cutter moves from the small to the large end of a blank, the roughing blade cuts out a tooth space. On the return stroke the finishing blades finish the tooth space which has just been roughed. The blank is held stationary during the cutting cycle and at the end of each return stroke of the cutter the blank is indexed at the gap in the cutter blade. Each revolution of the cutter completes a tooth space. Conjugate tooth forms are produced as a result of the cutter motion and the tooth shape used in the cutter blade. Except for chucking, operation of the machine is entirely automatic. There are no chucking delays, however, since the machine is provided with a rotary work-holding turret with three spindles. Thus, gears are removed and blanks loaded at two stations while cutting takes place at the third.

Among the interesting accessory units made available during 1940, was an easily portable head for making standard Brinell hardness tests, using a 3,000 kg. load on a 10 mm. ball. This unit weighs less than 26 lb., and is a precision hydraulic instru-

nt that indicates the load directly on an accurate hydraulic age. Overload is prevented by an inertia-free release valve. uge and valve are independently calibrated and check each er. The entire test head is easily detachable from the frame the instrument, so that by using a simple backing-up fixture ts of large size can be tested on any part of their surface. A croscope is used to measure the diameter of the impression. is microscope can be provided with a lamp and battery attach- nt fitted for portable service.

With the initiation of a mass-production program, such as was ssary in the aircraft and ordnance fields, shop personnel st be instructed in the operation and maintenance of new types equipment. In addition, a large number of new employees st be engaged and trained. One of the greatest obstacles in way of heavily increased production in 1940 was the lack of adequate supply of skilled men. Even though some of the chines were of semi-automatic and automatic types, they could be operated by wholly unskilled workers. The extreme pre- on required for many ordnance items, especially units like onautical engines, demanded a type of worker not easily pro- ed. Once the available supply of experienced workers was austed, the only course left open was to establish a training ogram for the unskilled. The development and application of h programs was a subject of major interest to a large number industrial organizations throughout the United States, Canada d Great Britain during 1940. Some plants set up training pro- ms in co-operation with local public school systems, others ensified their apprentice training program and put into opera- n short-term training plans for semi-skilled operators, while ers made use of a plan by which a helper was assigned to h machine. For a few weeks he did nothing but watch the lled operator perform his tasks. After this "watching" period, learner usually could take over some parts of the work and ually acquired sufficient skill to permit of his assignment to othor machine doing the same operation. (See also TEXTILE DUSTRY.)

(B. C. B.)

McNary, Charles Linza (1874–), U.S. candidate for vice-president on the Republican ticket in 1940, was born on a farm near Salem, Ore. June 12. After studying for two years at Leland Stanford university he gan law practice in 1898 and continued until he became justice of the state supreme court in 1913. In 1917 he was appointed S. senator to complete an unexpired term. He was elected to e senate for four succeeding terms (1919–42). On June 28 the republican National convention at Philadelphia nominated him e vice-president of the United States. McNary, who had never et Wendell L. Willkie prior to the convention, was a proponent TVA and other government power projects, and thus held ews diametrically opposed to those of the presidential candi- te. In his acceptance speech at Salem on Aug. 27 he declared e the public management and development of hydroelectric wer.

McNaughton, Andrew George Latta (1887 –), C.B.; C.M.G.; S.O.; born Moosomin (Sask.) Feb. 25; son of Robertuncan and Christina Mary Anne (Armour); educated Moosomin blic school, Bishop's college school, Lennoxville, P.Q., McGill iversity (1906–10), B.Sc., 1910, M.Sc. 1912, Senior Demon- ator in Electrical Engineering (1912–14); Honorary LL.D. 1920; married (Sept. 17, 1914) Mabel Clara Stuart Weir; chil- en, Christina Stuart, Andrew Leslie, Edward Dalzell, Ian Ar- ur, Leslie Stuart. General McNaughton served conspicuously the World War 1914–18, during which he commanded in suc-

cession the 4th battery, 2nd brigade, Canadian field artillery; the 21st howitzer battery; the 11th brigade C.F.A.; and next was appointed counter-battery staff officer of the Canadian corps. Wounded at the second battle of Ypres (April 1915) and again at Soissons (Feb. 1918) he was three times mentioned in despatches, awarded the Distinguished Service Order (1917) and made a Com- panion of the Order of St. Michael and St. George (1919).

Upon returning to Canada in May 1919 General McNaughton was appointed member of the committee for the reorganization of military forces of Canada, and in 1922 promoted to deputy chief of the Canadian general staff. In 1929 General McNaughton was again promoted, this time to chief of the general staff, a position which he held until asked to be president of the Canadian National Research council (1935). He served in this capacity until Oct. 6, 1939, when he was appointed to his present position, commander of the Canadian active service forces. As head of the National Research council, in addition to contributing numerous papers to technical journals, he particularly directed research in electrical and aeronautical investigations, and was joint inventor with W. A. Steel of the cathode-ray direction finder. At the close of the year (1940) General McNaughton was "somewhere in England" with the First Canadian Army corps by then consisting of two com- plete divisions together with ancillary troops. (J. T. C.)

McRae, James Henry (1863–1940), U.S. soldier, was born in Lumber City, Ga., Dec. 24. He was graduated from the United States Military academy in 1886 and rose through various promotions to the rank of major general. He commanded the 78th division of the U.S. army in the Meuse-Argonne offensive in the World War in 1918, for which he received the Distinguished Service medal. From 1924 to 1926 he was in command of the Philippine department of the army. For his services in the War of 1914–18 the British made him a Companion of the Order of the Bath. The French made him a Commander of the Legion of Honour and conferred on him the Croix de Guerre with palm. He died in Berkeley, Calif., May 1.

Madagascar: see FRENCH COLONIAL EMPIRE.

Magazines and Periodicals. The one great fact in the magazine and periodical business in the U.S. in 1940, as it was in 1939, was the war in Europe, with a definite quickening of interest in foreign and domestic affairs due to chaotic world conditions and national emergency. Magazine readership increased materially, with the biggest gains, as might be expected, in the news field. *Time*, *Newsweek*, *U.S. News* and especially *Life* showed formidable circulation gains.

According to *Advertising and Selling*, there were three main viewpoints taken by publishers on what people who were worried about cataclysmal events wanted to read.

First, as in the cases of *Cosmopolitan* and *McCall's*, was that men and women wanted respite from blood and thunder, wanted to read friendly fiction and pleasant home news. A directly opposite approach was the heavy emphasis on war news taken by many magazines—*Life*, *Look*, *Liberty*, for example. The third might be termed a neutral or halfway measure. This was emphasis on the reactions of individuals to the war and war conditions, and is exemplified by the articles of André Maurois and Quentin Reynolds in *Collier's*, Jules Romains in *The Saturday Evening Post*, René de Chambrun in the *Ladies' Home Journal*, and many others.

A new quarterly named *Common Ground* was founded in New York. Literal and cultural in nature, it was based on the develop- ment of mutual understanding among the many racial types found in the United States. The death of Heywood Broun brought to an

end publication of his *Nutmeg*, issued at Stamford, Conn., a periodical well known and especially admired by literary people and columnists.

The year 1940 showed the emergence as an important force of the accurate surveys on controversial subjects of national interest by *Fortune*. They were widely quoted by the press, and often carefully heeded by administrative and legislative leaders.

So far as classes and types of periodicals were concerned, there was very little change from the general situation which obtained during 1939. "News picture" magazines continued to enjoy great popularity; practically all of them increased their circulations, their size and the variety of their pictures and accompanying texts. A noticeable trend—perhaps due to the war—was an increase in the risqué, and a broader, more passive attitude toward it. The picture technique was not only used in the regular picture magazines but to an increasing extent in general magazines as well.

Light fiction, so-called pulp periodicals and the comic magazines also enjoyed continued popularity and increased circulations, probably also due to a general desire to "escape" the war. The amazingly successful *Readers' Digest* continued to spurn all offers to accept advertising and its circulation passed the 4,000,000 mark, the first time any weekly or monthly publication ever achieved such a figure.

The fact that a foreign language edition for South American consumption was inaugurated also attests to the great appeal of this magazine.

Although comparatively few new publications entered the field, those already there swelled circulations almost unbelievably. The creation of hundreds of thousands of new jobs and the promotions of thousands of men created tremendous interest in business, trade, industrial, technical, professional and specialized publications. Because there was more to talk about, and more to teach and educate about, editorial and advertising content jumped by leaps and bounds.

During the year the United States general public not only fully maintained but further increased its reputation as a reading public. This is reflected in the quantity and variety of the reading material it consumed. At the end of the year there were 6,468 periodicals being published in the United States, an increase over the previous year; 3,501 of these were monthlies, a gain of 35; and 1,366 weeklies, a loss of 33. (R. S. F.)

Great Britain.—The difficulties that beset the periodical publishing business of Great Britain during 1940 could scarcely be exaggerated—nor could the energy and persistence with which they were met and, to a large extent, overcome. Paper supply (see *NEWSPAPERS*), the loss of advertisement revenue, progressive increases in the cost of production led to changes in format, advance in selling prices and in advertisement rates, the banning of "returns," and to other economies. In May came the order prohibiting new issues and posters, and in September another order limiting paper supplies to one-third of pre-war normal, while the censorship and the threat of the purchase tax (happily averted) added difficulties of their own; but in spite of all this casualties were small, while there were even a few newcomers to record.

The following were among the periodicals that either succumbed or suspended publication: the *Grand Magazine*, *Humorist*, *Sunday Circle*, *Good Needlework*, *Anglo-German Review*, *Action*, *Courier*, *Twenty Story Magazine*, and the *Catholic Bulletin* of Dublin; among the trade and technical press—*Printing*, *Decorator and Painter*, *Dairy World*, *Art and Craft Education*, *Pianoforte Teacher*, *Sales Management*, *Credit World*, *Home Photographer* and *Photographic Dealer*; while of the sporting press the *British Motorist*, *Sports Car*, *Practical Motorist*, *Speedway World*, *Skating Times* and *Cyclist* failed to survive. A few trade papers amal-

gamated, as also did *Woman's Friend* and *Lady's Companion*, *Woman's Pictorial* and *Home Journal*, *Bystander* and *Tatler* (for "the duration"), *War Pictorial* and *War Weekly*, and *Stamp Collecting* and *Stamp Review*, among others. A large number of monthlies and weeklies increased their selling price, while some weeklies became fortnightly or monthlies—among them *Boxing*, *Practical Wireless*, *Wireless World* and the *Investors' Review*—and the fortnightly *Vogue* changed to once-a-month.

Turning to the other side of the medal there were among newcomers a revival of the last war's *Blighty*, which was circulated free to all troops overseas, and *Reveille*, a new and bright competitor with a growing circulation among the forces both at home and abroad; *Free Europe* (political and humanitarian); *Practical Engineering*, *Machine Shop Magazine*, *Aeroplane Maintenance*, *Wholesale and Export News* and *Goats*, a trade journal for the encouragement of the breeding of these animals in anticipation of a milk shortage. The *Strand* celebrated its jubilee with its Christmas number, the 600th issue.

In October the industry mourned the loss of Tibor Korda, killed in London as the result of enemy action, the brilliant Hungarian (naturalized British) who founded *World's Press News* (1929), *News Review*, *Parade* and other periodicals. (L. H. D.)

Maginot Line: see *EUROPEAN WAR*.

Magnesite.

Since the absorption of Austria and Czechoslovakia, Greater Germany heads the list of world magnesite producers, with a total close to 600,000 metric tons; intermediate producers, with outputs of 300,000–100,000 tons, include Manchoukuo, United States and Greece. Yugoslavia, Chosen, India and Australia range from 50,000 to 20,000 tons. Total output from these producers was about 1,250,000 metric tons in 1938. The Soviet Union reported increases in output of as much as 50,000–100,000 tons a year, reaching 482,000 tons in 1934, but these figures are so large in comparison with internal needs and visible exports that they have been received with considerable scepticism in the industry.

United States production of crude magnesite was 199,000 short tons in 1939, while sales included 1,100 tons of crude, 10,100 tons of caustic calcined, and 86,100 tons of dead-burned. This domestic supply was supplemented by 600 tons of crude, 2,200 tons of caustic calcined and 44,400 tons of dead-burned in imports, mainly from Austria and China, with smaller amounts from Czechoslovakia and a number of other producers.

British empire output is comparatively small, totalling about 50,000 tons in India, Australia and South Africa, plus an annual output of 25,000–30,000 tons of magnesitic dolomite in Canada. (G. A. Ro.)

Magnesium.

Although magnesium metal has been produced on a small scale for a limited number of uses for a long period of years, it is only since 1922 that its real commercial development began. The metal is now used extensively in a wide variety of light metal alloys, and plant capacity and production are expanding so rapidly that it is difficult to determine current outputs. The estimated 1939 output was 32,800 metric tons distributed as follows: Germany, 16,500; United Kingdom, 5,000; United States, 4,800; France, 2,500; Japan, 1,800; Switzerland, 700; Soviet Union, 1,200; and Italy, 300 tons. Practically the entire output is obtained by the electrolysis of magnesium chloride. Plans were under way in 1940 for the expansion of production in all important producing countries. (See also *METALLURGY*.)

(G. A. Ro.)

Magnetic Mines: see *BLOCKADE*.

Mail-Order Business, a commercial enterprise which carries on its retail transactions primarily by mail, and while found in other parts of the world, has reached its highest stage of development in the United States. The mail-order business had its inception during the era of rapid expansion following the Civil War. Due to geographical reasons, Chicago, Illinois, became the centre of this business, and remains so to this date. Montgomery Ward started in Chicago in 1892, and Sears, Roebuck and Co., now the largest mail-order house, started in North Redwood, Minnesota, in 1886, but moved to Chicago the following year. Other smaller mail-order companies got their start during this same period.

Isolation of farmers due to poor transportation facilities, high literacy of the U.S. public, increased earning power of the masses, inability of local retailers to meet consumer demands, prices charged by local retailers, convenience of the mail-order method, truthful advertising, guarantee of satisfaction, wide selection of merchandise offered by mail-order houses, combined with the popularity of the parcel post system, all were important contributions to the success of the mail-order method of selling. Although from its inception the mail-order method of distribution met with a measure of success, it was not until the turn of the century that the rapid expansion of mail-order sales got underway. For example, in 1900 the gross sales of Sears, Roebuck and Co. were \$11,000,000; by 1906 they had increased to more than \$20,000,000. Annual sales continued to increase until by the end of 1940 the combined sales of mail-order and retail operations had reached the huge sum of \$749,307,718, the largest in company history. The course of Montgomery Ward & Co., and other mail-order companies to a more or less degree parallels that of Sears.

The increased expansion noted above is to some extent attributable to large quantity purchases and to operating economies peculiar to the mail-order business, both of which have enabled these companies to raise the general standard of living by offering better quality merchandise at the same price charged elsewhere, or the same quality at a lower price.

Certain tendencies in the mail-order business are becoming more apparent. Examination of current catalogues reveals an increased emphasis upon private brands: *i.e.*, upon merchandise manufactured and sold under the proprietary trade names of the mail-order houses. Instalment account sales have also greatly increased, not from a lowering of credit standards, but by making available all kinds of merchandise to time payment purchasers. For instance, at the close of 1939 the Customers' Instalment Accounts balance of Montgomery Ward had reached the staggering sum of \$82,606,060 while that of Sears, Roebuck and Co. amounted to \$77,957,220.

Another factor which is said to have augmented mail-order sales is the maintenance of special booths in retail stores for the purpose of assisting customers in ordering mail-order items not carried in retail stock.

In the middle of the 1920s, the two largest mail-order houses, commonly known as Sears' and Ward's, entered the retail store field. This new activity was largely experimental until about 1928, when the two companies, apparently believing that they had learned enough about retail store operation to justify considerable expansion in this field, opened retail units in a number of communities. By the end of 1940 Sears' were operating slightly under 600 stores, and Ward's in excess of 600. By this time, too, it was clear that the original function of the two mail-order houses had been modified by the added function of acting as competitors to their own retail stores, whose sales it is estimated are running over 60% of total sales. (See also **MARKETING; RETAIL SALES.**) (J. G. ME.)

Maine, extreme northeastern state of the United States, admitted as a state in 1820 and popularly known as the "Pine Tree state," has an area of 33,040 sq.mi. Population (census 1940) 847,226, a gain of 6.2% for the decade. The capital is Augusta, 19,360; the largest city, Portland, 73,643.

History.—The *Bangor Daily News* carried further its 1939 attack on the state financial administration and claimed the credit for disclosures of irregularities and embezzlement after a private

firm of auditors was hired to check up on the work of the state auditing department. On April 1, shortly before he was to testify to private auditors, William Runnells, state controller, was found shot. The auditors are reported to have discovered shortages in his accounts totalling more than \$157,000. A sweeping investigation was subsequently carried out by a committee selected by a special session of the legislature.

SUMNER SEWALL, Republican governor of Maine, elected Sept. 9, 1940

Resignation of three high officials and the creation of a permanent legislative investigating and research committee, were results of the scandal. Committee reports disclosed widespread administrative inefficiency and disregard for the statutes. A defective administrative organization and the continuance of the spoils system appeared to be responsible for many of the difficulties, with public apathy and a one-party (Republican) system as contributing factors. Campaign charges of graft and inefficiency did not cause defeat of the well entrenched Republican party, although control was shifted from one faction to another. Senate president Sumner Sewall of Bath, member of an old ship-building family, aviator of the World War (1914-18) and businessman, was elected governor by a vote of 162,719 to 92,003 on a platform promising honesty, economy and efficiency in state affairs. In the same election (September), three Republican representatives and a senator were elected: James C. Oliver of Portland (1st district) re-elected, Margaret Smith of Skowhegan (2nd district) and Frank Fellows of Bangor (3rd district). Mrs. Smith had previously been selected at a special election to complete the term of Representative Clyde H. Smith, her deceased husband. Representative Ralph O. Brewster (3rd district) won the senate seat vacated by Senator Frederick Hale by defeating Governor Barrows in the June (Republican) primary. Fewer Democrats were elected to the state legislature than in 1938, but there was much new Republican blood, with over half of the house membership made up of "freshmen." An election surprise was the narrow Willkie margin of 163,951 to 156,478 votes over President Roosevelt in November, after the decisive Republican victory in September and large majorities for the Republican presidential candidates in 1932 and 1936. While Roosevelt carried all but Maine and Vermont in 1936, Maine was one of a few states where Roosevelt gained votes in 1940. The legislature met in special session in May, July and October, but passed no major bills. Several earthquakes were recorded late in the year, apparently centring in the neighbouring state of New Hampshire. A religious sect, Jehovah's Witnesses, was the victim of mob violence and property damage in several sections of the state. The disturbances culminated in the slaying of a deputy sheriff and the conviction of a Witness minister.

Education.—Maine continued to be low in its expenditures for rural schools compared with a majority of states. An annual "equalization fund" of \$200,000 has been in effect since 1937 and together with other state and federal assistance has furnished some relief. Colby college carried on construction of buildings on its new campus. The University of Maine completed a dormitory for women and built a chemistry laboratory.

Charities and Correction.—The population of state institutions for criminals and mental patients increased slightly, with existing buildings inadequate.

Banking and Finance.—Bank deposits continued at high levels during 1939 and 1940. Interest rates were variable and somewhat higher than in Boston and New York.

Agriculture and Manufactures.—Maine's largest source of income, the tourist business, was estimated at \$98,000,000, about the same as in 1939. Automobile registrations and gasoline taxes reached new high levels. Maine's potato crop for 1940 was estimated at 44,055,000 bu., an average yield, but larger than 1938 (39,600,000) or 1939 (37,260,000). The national crop in 1939 was 363,159,000 and as estimated for 1940, 397,722,000. The average Maine price per bushel for the 1939 crop was 74 cents; reports through November showed a 44-cent average for the 1940 crop, with large quantities being held and continued low prices in prospect due to above average national production. General business conditions in the state were better in 1940 than in 1939 or 1938 and near to the high figures of 1937. Most skilled and semiskilled workers found employment before the year ended. There was some migration of skilled labour, especially to other New England states. Maine textile and war industries began to feel a shortage of skilled workers as the year ended. Activity was lowest in September and October, with a vigorous rise thereafter, due to war orders. Bath and Kittery were active because of naval shipbuilding at the Bath Iron works and the Portsmouth navy yard, which is located at Kittery, Maine. Contracts were let for the building of 30 cargo ships for Britain, to be constructed at South Portland. Eighty men from Maine were inducted in the peacetime draft, national guard units were called to active service and defence airport construction hastened. Large numbers of unskilled workers remained unemployed and WPA rolls were only slightly below 1939 figures. (E. F. D.)

Malta: *see* BRITISH POSSESSIONS IN THE MEDITERRANEAN.

Manchoukuo (MANCHURIA), an empire, closely connected with Japan, located in northeastern Asia, bounded on the north and east by Siberia, on the west by Siberia, outer Mongolia and China proper, on the southeast by Korea. Its main outlet to the outside world is through the Kwantung leased territory, with its large port of Dairen, which is administered directly by Japan. The capital is Hsinking; the emperor, Kangte.

Area and Population.—The area is 460,383 sq.mi.; the population (Dec. 1937) 36,949,975, including 418,000 Japanese and 931,000 Koreans. Population of largest cities (June 1938): Mukden (772,017), Harbin (467,453), Hsinking (360,294), Antung (210,759).

History.—Manchuria formerly constituted the three northeastern provinces of China, Fengtien, Kirin and Heilungkiang. They were not under direct unrestricted Chinese sovereignty. Before the World War of 1914-18 Japan possessed extensive economic and extraterritorial rights in South Manchuria and Russia possessed somewhat similar rights in North Manchuria. Agents of

commercial and general economic penetration of the two countries were the Japanese-owned South Manchuria railway and Russian-financed Chinese Eastern railway. Chang Tso-lin and his son and successor Chang Hsüeh-liang ruled Manchuria as far as it was not under foreign influence as a virtually independent principality, reckoning very little with the central government. Following a series of political and economic disputes, the Japanese army overthrew the regime of Chang Hsüeh-liang in 1932. Manchoukuo was proclaimed an independent state on March 9, 1932, and Henry Pu Yi, scion of the old Chinese Manchu dynasty, was declared emperor under the name of Kangte on March 1, 1934. Japan quit the League of Nations because of the league's condemnation of its action in Manchoukuo and for several years Japan and El Salvador were the only powers who recognized the new self-styled empire. In recent years Germany, Italy and some of the smaller European states have accorded recognition. The United States and Great Britain maintain consular representatives who enjoy no official status but deal with the Japanese and Manchoukuo authorities on an informal basis.

Education and Religion.—At the end of 1938 there were 1,866 primary schools in Manchoukuo, with 1,429,805 pupils; 11 high schools with 31,323 pupils; 8 colleges with 1,854 pupils; 1 normal college with 525 students; and 1 university with 1,100 students. The principal religions were Confucianism, Buddhism, Taoism, Lamaism and Mohammedanism. There were a little less than 100,000 Christians in the country, of whom 64,200 were Roman Catholics and 32,192 were Protestants.

Armed Forces.—The strength of the Manchoukuo army was given as 80,000 in 1940. The country maintained 11 gunboats and 4 other vessels for river and coastal guard duty. Much larger and better equipped than the Manchoukuo army was the Japanese Kwantung army, the size of which was kept secret, and probably varied from time to time.

Finances and Banking.—The unit of currency, the Manchoukuo yuan, was maintained at parity with the Japanese yen (value as of Dec. 15, 1940, 23.48 U.S. cents). The budget for the calendar year 1939 was 403,377,000 yen, as compared with 304,555,000 yen in 1938 and 248,098,000 yen in 1937. At the end of 1939 there were 85 banks in Manchoukuo, of which the two most important local banks were the Central Bank of Manchou, which controls the note issue, and the Industrial Bank of Manchoukuo.

Trade and Communications.—Manchoukuo's imports in 1939 were valued at 1,505,011,000 yuan, while exports were 821,190,000 yuan. The corresponding figures for 1938 were 1,277,748,000 yuan and 725,454,000 yuan. Japan supplied about 83% of Manchoukuo's imports in 1939 and took about 62% of its exports. Manchoukuo has over 6,000 mi. of railway lines, of which over 2,000 were constructed after the creation of the new state. One of the most important of the new lines, from the economic standpoint, gave Manchoukuo a sea outlet to the east through the new port of Rashin, in north Korea. About 8,000 mi. of new roads have been built since 1932. There were 13 commercial air routes in Manchoukuo, with a total length of a little more than 3,000 miles.

Agriculture, Natural Resources, Manufactures.—The soybean was Manchoukuo's staple crop and the country also produced substantial quantities of kaoliang, millet, corn and wheat and smaller quantities of rice, tobacco and cotton. Efforts to introduce these last crops have met with an obstacle in the severity of the winter climate. In 1938 Manchoukuo produced 4,185,774,000 metric tons of soybeans, 4,152,406,000 tons of kaoliang, 3,049,291 tons of millet, 2,440,535 tons of corn and 854,326 tons of wheat. Important natural resources are iron, coal and timber. Reports of large gold deposits seem to have

en exaggerated. Japan was pushing the industrial development Manchoukuo and Mukden and its environs became an outstanding centre of heavy industry. Pronounced inflationary symptoms appeared in 1939. The note issue, for instance, rose from 426,000,000 yuan at the end of 1938 to 624,000,000 yuan at the end of 1939. Government borrowings in the same period increased from 109,000,000 yuan to 390,000,000 yuan, while the commodity price index in the summer of 1940 was 85.5% higher than in the period before the beginning of the Sino-Japanese war. This situation led to some curtailment of production and capital investment plans.

Mandated Pacific Islands: see PACIFIC ISLANDS, MANDATED.

Mandates. The 37th session of the mandates commission, which met in Dec. 1939, reported only on the situation in 1938. But it could not ignore the new situation already created by the war, which involved the whole question of the status of territories under the mandate of belligerent powers during war. The vicechairman, M. Rappard, summed up the situation. At least two states members of the League of Nations were then at war with Germany, and at the same time were administering as members of the league what were the former Ger-

man colonies. The question arose whether the league was to be regarded as in the exclusive service of these powers at war or whether it exercised on behalf of the international community a supervision independent of national influences. For the future of the league, of international government and of the whole problem of colonial administration, this was a matter of vital importance. The mandates commission accordingly adopted a resolution asking the mandatory governments to forward information in the 1939 reports on their stewardship, which would help the commission to judge how far the belligerency of the mandatory powers was affecting the status and administration of the territories involved.

But in 1940 the course of the war disrupted normal events. The mandates commission was unable to hold a session. No 1939 reports could therefore be published. The plain fact, it was clear, was that certain mandated areas were automatically involved in a state of war: noticeably Palestine, Syria, Tanganyika. Light could not be thrown on the extent to which administration of these areas had been affected and the legal and international issues involved until the written reports of the responsible governments became available. (See also LEAGUE OF NATIONS.) (M. FE.)

Manganese. World manganese production in 1937 rose to a new record figure, estimated at 6,000,000 metric tons, but declined about 15% in 1938 and 6% in 1939, each based

Mandated Territories

Territory	Area	Date of Mandate	Mandatory Power	Former Title	Former Administration
South-west Africa, including Caprivi Zipfel, formerly part of Bechuanaland protectorate.	317,725 sq.mi.	Dec. 17, 1920	Union of South Africa	German South-west Africa	German Empire
Togo, comprising: (1) Togoland, i.e. western section, excluding the seaboard (2) Togo, i.e. eastern section and seaboard	13,040 sq.mi. 20,000 sq.mi.	July 20, 1922	Great Britain France	Togo	German Empire
Cameroons, comprising: (1) Cameroons adjoining Nigeria (2) Cameroons adjoining French Equatorial Africa	34,081 sq.mi. 161,200 sq.mi.	July 20, 1922	Great Britain France	Kamerun	German Empire
Tanganyika. Ruanda-Urundi.	360,000 sq.mi. 21,200 sq.mi.	July 20, 1922	Great Britain Belgium	German East Africa	German Empire

Nauru.	8 sq.mi.	Dec. 17, 1920	British Empire, as represented by Great Britain, Australia, and New Zealand	Nauru	German Empire
Pacific Islands North of the Equator, comprising: (1) Marianne or Ladrone Islands (except Guam) (2) Caroline Islands, comprising the Eastern Carolines and Western Carolines, together with Yap Island and Pelew (3) Marshall Islands	811 sq.mi.	Dec. 17, 1920	Japan	No change	German Empire

on the preceding year. The status of the leading producers is shown in the accompanying table. The feature of the manganese industry in recent years has been the rapid rise of South Africa from a minor producer to third rank, following the soviet union and India; production in the first half of 1940 was 8% below the 1939 average, but exports were down only 6% and the third rank position apparently was lost to Gold Coast, where output in the first half was slightly higher. Brazil exported more ore in the first three-quarters than in all of 1939 and Cuba made a new record high, with shipments in 11 months 16% more than the former 1937 record and 49% above the 1939 total. The stocking program being carried on in the United States did not have much effect on output, shipments through Nov. 1940 having amounted to 36,500 long tons, against 29,300 tons in 1939. No production information is available from the soviet union, but both production and exports have been declining for several years.

The soviet union is the only important producer which is also a consumer on any appreciable scale and since production and consumption by other countries approximately balance, this means that, roughly speaking, the difference between the total output and the total consumer imports for any year is an approximate measure of the amount of the Russian output that has been retained within the country. Since 1934 this amount has been far in excess of any possible demand of the local steel industry, indicating that large amounts are being held in stock.

World Production and Imports of Manganese Ore
(In thousands of metric tons)

*The figure in parentheses was the number of months in the year for which import data were available.

Imports into the United States rose to a record figure in 1940, receipts in 11 months totalling 1,199,000 long tons, against a former high of 912,000 tons in 1937. A record steel output of over 60,000,000 tons would account for about two-thirds of the imports and the remainder went into either government or consumers' stocks. (See also METALLURGY.) (G. A. Ro.)

Manitoba, midcontinent province of Canada, the oldest and most easterly prairie province. Area, 246,512 sq.mi. (26,789 sq.mi. water); population (1939 est. dominion bureau of statistics), 727,000; urban, 44%. The 1936 census indicates British racial origin, 362,389; Ukrainian, 86,982; German, 52,450; French, 47,683; Polish, 35,136; Scandinavian, 21,504; Dutch, 25,521; others, 66,210. Total Canadian-born, 70%. Capital, Win-

ipeg, incorporated 1873; population (Nov. 1940), 223,735.

History.—The unicameral legislature of Manitoba consists of 55 members, with a nonpartisan government representing Liberal, Progressive, Conservative, Co-operative Commonwealth Federation and Social Credit parties, headed by Hon. John Bracken premier since 1922.

The lieutenant governor is Hon. R. F. McWilliams, K.C., appointed Nov. 1, 1940. Manitoba elects 17 members to the house of commons and has six representatives in the Canadian senate.

Education.—Public, elementary and secondary schools are maintained by general taxation, with the Manitoba university, including a faculty of agriculture, and affiliated colleges (including Brandon college) providing for higher education. There are also several other colleges and schools. Pupils in elementary grade, 114,822; in secondary, 22,408. Full-time students enrolled in university, 2,894.

Banking and Finance.—Winnipeg, financial centre of western Canada, is western headquarters of 8 of the 12 Canadian banks and of insurance, mortgage and financial institutions.

Agricultural, Mineral, Manufacturing, Other Production.—A consolidation of all agricultural organizations in Manitoba exists under the title Manitoba Farmers' federation.

Total gross value of agricultural production in Manitoba in 1939, \$94,309,000; manufactures (1938), \$131,770,280; mineral production, \$17,482,640; fisheries, \$1,627,212; f.o.b. Winnipeg furs, wild catch, \$1,352,598; fur farms, \$629,793; processed in Winnipeg, \$638,383; f.o.b. Winnipeg, including furs from other provinces, \$5,308,153.38.

Railways.—Canadian Pacific railway (Manitoba division), mileage, single track, 1,897; double, 633; yards and sidings, 976; total, 3,506. Canadian National railway, single track, 2,448; double, 29; yards and sidings, 547; total, 3,024. Hudson Bay railway, 510; Midland railway, 75; Greater Winnipeg Water district, 92.

Highways.—Surfaced, including trans-Canada, 8,734 mi. (gravelled, 8,228; bituminous, 489; concrete, 17). Government-owned telephone system has 73,383 telephones, 415 exchanges, total wire mileage 309,000, and operates two radio stations, one of 15,000 watts at Winnipeg and one of 1,000 watts at Brandon.

(J. L. J.)

Manly, John Matthews (1865–1940), professor emeritus of English, University of Chicago, was born in Sumter county, Ala., Sept. 2. He was educated at Furman and Harvard universities. He taught in the English department of Brown university from 1891 to 1898 and in the latter year became head of the English department of the University of Chicago, retiring in 1933. In 1909 he was an exchange professor at the University of Göttingen. He obtained a leave of absence for the duration of the World War of 1914–18 when the United States began to participate in it and was assigned to the military intelligence department. He wrote many books on English literature and specialized in the study of Chaucer. He edited an edition of *The Text of the Canterbury Tales* in eight volumes in 1938. He died in Tucson, Ariz., April 2.

Mannerheim Line: see EUROPEAN WAR; FINLAND.

Maple Sugar. Production of maple syrup increased in both the U.S. and Canada in 1940; in the States 2,583,000 gal. in 1940 compared with 2,515,000 gal. in 1939, and in the dominion 2,755,200 gal. in 1940 and 2,302,000 gal. in 1939. The United States produced 611,000 lb. of maple sugar in 1940 and 760,000 in 1939; Canada, 3,437,500 lb. in 1940 and 2,900,200 in 1939. In the United States 10,111,000 trees were tapped in 1940 against 10,520,000 in 1939. Between 20,000,000 and

100,000 trees are tapped annually in Canada. About one-fourth Canadian production is exported to the United States.

(S. O. R.)

Marble and Granite. The production of marble in the United States in 1939 rose 39% to 1,700 short tons, valued at \$6,305,000, 75% of which was building stone and 25% monumental stone. Most of the crushed broken marble sold is waste from the dimension stone branch of the industry; this increased by 20% in 1939, to 104,300 short tons, valued at \$383,600. Canadian production of marble was 11,14,100 short tons in 1939, a decline of 25% from 1938. Marble production in Great Britain is not of commercial importance, most of the supply being imported.

Granite.—The United States production of granite as dimension stone in 1939 increased by 9%, to 733,600 short tons, valued at \$9,838,000; 64% of this was building stone, 24% monumental stone, 4% paving stone and 8% kerbing; production as crushed broken stone increased by 16% over 1938, to 11,308,000 short tons, valued at \$12,658,000; 78% of the total was for concrete aggregate or road metal, and 11% as railroad ballast; riprap, which constituted 46% of the 1936 total, was 10% in 1939. Canadian production of granite increased by 55% in 1939, to 1,102,400 short tons, valued at \$2,119,500. Production of granite in Great Britain is reported along with other types of igneous rocks, increasing in 1938 by 9% to 11,435,000 long tons, valued at \$61,000; 86% of the total was used for road metal or ballast.

(G. A. Ro.)

Archesi, Blanche (BARONNE CACCAMISI) (1863-1940), opera singer, was born in Paris, April 1863, of a German mother and Italian father. She began her musical career as a teacher at the age of 15, and her operatic career started when she sang Brunhild in *Die Walkure* at the Grand opera house in 1900. She appeared in France, Germany, Holland, Belgium, the British Indies and the United States, touring the latter country twice. She received British and Belgian honors and wrote a volume of reminiscences, *A Singer's Reminiscences*. She died in London, Dec. 15.

Argoliouth, David Samuel (1858-1940), British Arabic scholar, was born in London, Oct. 17, and died there, March 23. For a biographical sketch see *Encyclopædia Britannica*, vol. 14, p. 879.

Marijuana: see CHEMISTRY; PSYCHIATRY.

Marine Biology. A little over a year of war in Europe and a longer interval in the orient combined to deal crushing blows to productive effort in marine biology all over the world in 1940. The year witnessed one after another of the maritime countries of the European continent struck with such lightning-like rapidity that not only was the personnel of their marine institutions affected, but in many instances the physical plants and equipment were requisitioned or destroyed by ruthless invaders. A similar fate was met by the biological programs of both Britain and France. So critical in fact was the effect of the war on all scientific societies of Great Britain that an appeal was made for financial support of their scientific publications if they were not to be discontinued altogether. The advent of Italy in the war caused a cessation of marine work in Mediterranean countries and the sea closed to biological field work by blockade. Nor did the damage stop in Europe. Research problems formulated about the Pacific ocean, especially in Japan and in China, have long since ceased. Such worldwide conditions not only disrupted long range programs but discouraged and inhibited the advent of new ones. "Free science in America means free science for all the world," wrote a delegate from the University of Latvia (whose faculties were banished) to the joint celebration of the 200th anniversary of the founding of the University of Pennsylvania and the annual meeting of the National Academy of Science meeting in Philadelphia. Just how critical the situation became in international science may be inferred by a note in the *New York Times*, wherein the American Association of Scientific Workers offered to be the custodians of the research results of British scientists. This offer included the preservation not only of their papers, notes and manuscripts, but valuable books and important collections of specimens, technical apparatus and other appurtenances used in specific undertakings. Thus, for example, according to *Science*, a new "Plankton Recorder" was sent from the University college (Hull) to the Oceanographic institute at Woods Hole (Massachusetts) to be kept and used by the latter institution for the duration of the war. This instrument was perfected to record continuously plankton samples without the necessity of its removal from the water. It was to be installed by agreement upon the "Atlantis," but subsequent report came that the "Atlantis" and its newly-acquired sister ship the "Anton Dohrn," a 70-foot power boat, a gift of the Carnegie Institution of Washington, would find a more urgent sphere of usefulness in the national defence program of the United States.

Certain biological aspects of the sea's atmosphere over the Atlantic were studied by aeroplane in relation to the presence of ragweed and other pollens, fungus and mould-spores and other types of vegetation. The investigator found that by exposing sticky glass slides at intervals and at various altitudes to and from Bermuda an accurate index of the relative distribution of such organism was obtained. Ragweed pollen (one of the chief causes of hay fever) was present over Long Island and out to sea for a distance of some 80 miles. Over the open sea beyond, only mould and fungus spores were trapped in the sampling. In an attempt to discover the nutritive value of certain of the seaweeds (kelp and Irish moss) that grow in great abundance along both coasts of the western hemisphere, workers in the United States Fish and Wild Life laboratory fed graded percentages of these plants to experimental rat colonies. Diets containing up to approximately 10% kelp (agar) grew 20% faster than the controls, while on a diet of Irish moss the growth was but two-thirds that of the controls. It is assumed these studies have wide practical interest in human nutrition, since it is known that in some European countries as well as in Japan and China a considerable part of the human dietary consists of these marine plants.

The United States department of agriculture reported the suc-

successful extraction of an insect-killing drug "rotenone" from a seashore plant known as the devil's shoestring. This accomplishment will augment the now diminishing supply of the drug chiefly imported from the Netherlands East Indies. According to the report the greatest quantity is yielded by the plant during the time of its blossoming.

The Academy of Science of the U.S.S.R. reported a taxonomic study of the ichthyofauna of the Laptev sea in the Arctic region in connection with other explorations. The report suggested that out of a total of 315 specimens taken, certain ones are typical Atlantic and others typical Pacific forms, while a few give evidence of interbreeding.

The icebreaker "Sedov" which returned to Murmansk in January 1940 after a remarkable drift of 27 months in the Arctic, again set out on an expedition sponsored by the geographical department of the U.S.S.R. This expedition is to sound and study currents, ascertain wind velocities, determine ice conditions and observe magnetic changes over a distance of some 200 mi. of the Kara sea from Izvestia Tsik islands to Russky island.

Because of its valuable vitamin A content of the liver, the shark assumed a prominent place in the fishing industry along the north Pacific coast. This product now stands second in potency as a source of vitamin A.

Referring to the Byrd expedition to Little America, it is interesting to record that on Sept. 27 President Roosevelt awarded a gold star to Rear Admiral Richard E. Byrd, retired, in recognition of his successful Antarctic explorations. Although Admiral Byrd returned to the United States, his party remained in Little

America exploring the Antarctic continent and adjacent waters in and around the Bay of Whales.

The American Association for the Advancement of Science, through a financial grant to the South Carolina Academy of Science, discovered that "mud-blister" on the oyster (*Ostrea virginica*) is caused by a tiny annelid worm *Polydora ciliata*. The parasite infests approximately 30% of the oysters of the south Atlantic coast, so that its control is of considerable value to the shellfish industry of the south.

A worker at the Scripps Institution of Oceanography, La Jolla, discovered reversible currents in ocean canyons 2,000 to 3,000 feet below the ocean surface off the coast of California. Since these currents sweep in and out at irregular intervals every few hours, they are not related in periodicity to the tides and bear no tidal relationship. They are thought to be caused by deep-sea eddies. A similar study of the sediments and geology of the Gulf of California was being sponsored by the University of California and the Geological Society of America, using the research vessel the "E. W. Scripps" out of La Jolla.

One of the two Gobioid fishes new to science, collected on the Roosevelt presidential cruise into the Caribbean sea in 1938, was given the name of *Pycnomma roosevelti* in his honour. The specimen classified by a worker in the Smithsonian institute was taken in latitude 13° 21' N. and longitude 81° 22' W. off old Provident island. (See also OCEANOGRAPHY; ZOOLOGY.)

FIRST PORPOISE ever born in captivity, at Marineland, Fla., Feb. 14, 1940

Marine Corps, a military organization of all arms, is an integral part of the U.S. navy, specially organized and trained to meet the needs of the fleet afloat and ashore. Established by act of the Continental Congress Nov. 10, 1790, the present authorized strength is officers 1,600, enlisted 34,000. Organized reserves consist of officers 525, enlisted 5,800, now in active service. The commandant in 1940 was Major General Thomas Holcomb.

At sea, marine detachments serve aboard 57 battleships and 10 cruisers as part of the crew performing general duties and manning some of the guns, total so employed: officers 140, enlisted 3,200. On shore, marines are stationed at navy yards and stations guarding these activities, there being 28 such posts within the continental limits of the United States and 15 overseas posts including a regiment on expeditionary duty at Shanghai, China, and a battalion at the American embassy, Peiping, China. Other overseas posts are at Hawaii, Guam, the Philippines and Virgin Islands. Total at home shore stations: officers 134, enlisted 4,400; at overseas posts: officers 130, enlisted 3,000.

The fleet marine force (F.M.F.), strength, officers 500, enlisted 10,000, consisted in 1940 of 2 divisions made up of infantry, artillery, aviation squadrons, tank battalions, communication companies and service troops, specially trained for landing operations and to capture and defend bases required by the fleet in overseas operations. F.M.F. divisions are carried with the fleet when required in special transports and provided with special landing boats for landing operations on hostile shores, and are stationed for shore drills and training at bases at Quantico, Va., and San Diego, Calif.

Aviation attached to F.M.F. divisions consists of 30 air squadrons based at Quantico, Va., San Diego, Calif. and St. Thomas, V.I.; strength, officers 360, enlisted 2,300, including reserves.

ers 130, enlisted 670. The aviation units also serve tours
ard aircraft carriers of the navy.
Marine corps organized reserves, officers 525, enlisted 5,800,
now on active duty under emergency conditions.
Officers are attached to 26 schools of the navy and the army
special courses and enlisted men to 23 such schools.
Officers are commissioned from graduates of the Naval acad-
and distinguished military colleges and from qualified en-
d men. The ranks of officers and enlisted men correspond to
e of the navy, but the titles are those of the army.

Market Gardening. Acreage of commercial vegetable
crops grown for market in the United
States in 1940 was 1,727,820 ac., slightly under the 1,785,150 ac.
1939, but above the ten-year (1929-38) average of 1,612,240
ac. Except for small temporary reductions the production of
vegetables has increased steadily since 1918 in the United States.
For cyclical trends and production of vegetables for processing
see TRUCK FARMING; also see LETTUCE; POTATOES; SWEET
POTATOES; TOMATOES.)
United States production of the principal vegetables grown
for market, with acreage for 1940 and 1939, as given by the
Department of agriculture for 1940 (preliminary), 1939 and
the ten-year (1929-38) average is shown in Table I.

Table I.—U. S. Yield and Acreage of Market Vegetables for Certain Periods

	1940 acres	1939 acres	1940 production	1939 production	10-yr. av. production	Unit of measure

*California only. †New Jersey only. ‡Virginia only.

There are about 650,000 commercial vegetable farmers in the
United States. Two new vegetables were announced in 1940. One
was a hybrid squash, produced at the Connecticut Agricultural
Experiment Station. The other was a new watermelon weighing 2 to 5 lb.
and designed to fit the refrigerators of city apartment dwellers.
The average watermelon weighs 25 lb. and many growers
specialize in producing melons of 45 lb. or better. The tiny melon
is produced by D. Stanley Brown of Blackville, S.C., after
experiments beginning in 1933. Cuba is a chief source of fresh
vegetable imports to the United States. Table II shows Cuban
exports to the United States from Nov. 1939 to Sept. 1940 and

Marketing. The United States census of 1940, covering as it
does the retail, wholesale and service trades for
the year 1939, presented the best statement on the statistical
importance of marketing in this country available. Retail sales
in 1939 amounted to \$42,023,818,000, an increase of 28% over
the total sales of \$32,791,212,000, but fell short of the total sales
of \$48,329,652,000 of 1929 by 13%. The number of retail stores
in 1939, 1,770,404, however, topped the number of stores in
1929, 1,476,365, by 20%. The increase in the number of stores
was not merely noteworthy in itself but also for the reason
that it was nearly three times the total increase in population of
7.2% that occurred in the same period of time.

The most noteworthy gains in number of retail stores occurred
among food stores, eating and drinking places, filling stations,
fuel oil dealers and second-hand stores. Moderate gains were
made by drugstores. Actual declines in number of stores oc-
curred among general stores, general merchandise stores, apparel
shops, furniture stores and lumber dealers. About half of the
total increase in number of retailers was due to the 154,000 drink-
ing places and liquor stores listed in 1939 that did not exist in
1929.

In the general merchandise group variety stores alone showed a
marked increase, not only from 12,110 stores in 1929 to 16,945
stores in 1939, but also in its sales totalling nearly \$1,000,-
000,000, an increase of 8% in dollar sales over 1929.

The wholesale trade of the United States also showed an in-
crease from 168,820 up to 201,781 establishments in the ten-year

period ending in 1939. The percentage of increase in number of establishments, 20%, happened to be precisely the same as the increase in the number of retail concerns. Wholesaling, however, failed slightly to keep up with the trend of retail sales in the same period. The total sales for the wholesale trade of \$55,112,468,000 for 1939 represented a loss of 18% under 1929 as against a loss of only 13% in total sales by the retail trade for the same period.

The excess of wholesale sales over retail sales noted above may be explained by the fact that there were in 1940 many wholesalers who conducted an export business, who made sales to other wholesalers and jobbers and still others who sold raw materials and other goods to industrial, commercial, institutional and professional users.

The substantial gains in numbers of establishments, as well as the maintenance of total sales for wholesalers since 1930, showed that the wholesaler-retailer system of distribution continued as the channel through which nearly three-fourths of all consumer goods reach the public. The various systems of retailing that purchased most of their goods directly from producers, including the department stores, mail-order houses and chain stores, apparently did but little more than hold their own either in numbers of stores or in volume of sales. The position of these institutions in the general system of distribution of goods was established and settled. Gains in numbers of units as well as in sales apparently depended on general gains in business enjoyed by all rather than by gains captured from other channels by competition.

Among the marketing institutions that have shown the most rapid development since 1930 may be mentioned the supermarkets, the department stores of the food trades; the "voluntary chains," groups of independent retailers tied to wholesale establishments by contracts; retailers' co-operatives and consumers' co-operatives. It appears that there are more retail establishments in the voluntary chains and retailers' co-operatives than there are units in the corporate chains. Consumers' co-operatives that have been important factors for more than a generation in several of the northern European countries, are negligible in the United States both in point of numbers of establishments and in volume of business. It is a significant matter, however, that the sales of consumers' co-operatives in the U.S. seem to have doubled since 1930.

Direct-to-consumer, or house-to-house selling, has always been and is still important in the sale of many commodities of common use, such as: milk, fresh fruits, vegetables and other food products, periodicals, books, articles of apparel and many other goods. House-to-house distribution in most lines rises and falls inversely to the rise and fall of business conditions. The numbers engaged in this field of selling tend to increase when general business conditions decline and, similarly, to fall when business conditions improve.

Especially noteworthy among the developments affecting the distribution of goods in the late 1930s was the introduction of vocational training for workers in the distributive trades. Under the provisions of the George-Deen Federal act of 1936 modest sums of money have been appropriated annually for the use of the various states, to be matched by similar state funds, in the employment of teachers to conduct practical instruction in the arts and knowledge needed by employees in the distributive trades. The number of retail employees enrolled in such classes during each of three years ending June 30, for which figures are available, are as follows: 1938—36,008; 1939—88,429, and 1940—127,695 students. (See also MAIL-ORDER BUSINESS; RETAIL SALES.)

Markham, Edwin (1852–1940), U.S. poet and lecturer, born in Oregon City, Ore., April 23; died in Westerleigh, N.Y., March 7. For a biographical sketch see *Encyclopædia Britannica*, vol. 14, p. 921.

Marler, Sir Herbert (Meredith) (1876–1940), Canadian diplomat, born in Montreal, March 7, the son of William deM. Marler, professor of real estate law in McGill university. He was graduated from McGill in 1898 and was associated with his father in the practice of law until 1929 when he was appointed Canadian minister to Japan, after having held various offices of responsibility at home. He remained in Japan until 1936 when he was made minister to the United States, resigning on Sept. 11, 1936, because of ill-health. He was created a Knight Commander of St. Michael and St. George in 1935. He died in Montreal, Jan. 1940.

Marriage and Divorce. The social attitude of U.S. leadership which in recent years has been expressed in emphasis upon constructive effort in the field of marriage and the family was evident during 1940. There were, however, two special trends that by their prominence distinguished the year 1940. The first of these resulted from the international situation. The war which began in Europe in 1939, by influencing the national policy, especially U.S. preparedness for possible war, led to an increase of marriages. This increase was popularly interpreted as an attempt to escape the draft. Although this was undoubtedly one reason, due to a misunderstanding of the provisions of the draft law, it does not appear to have been the only motive. The greater seriousness engendered by the social situation in the thinking of many young people who through desire for greater economic or other security were postponing marriage, led to a less regardful outlook and to the advancing of their wedding.

The second distinctive trend is not new but it was expressed with unprecedented popular concern. There was a more widespread recognition of the dysgenic aspects of population growth. This appeared in a quantity of public discussion, in literature both popular and scientific, dealing with the problems of fertility and with the motivations that are leading individuals in the middle class and professional class, especially, to postpone parenthood to attempt a childless family, or to have but one child. The idea of planned parenthood is passing out of the negative phase of popularizing birth control to the more positive program of increasing births among one group while lessening them among another.

The New England conference on Tomorrow's Children at Harvard university, which attracted widespread interest, featured panel discussions on "The Undeveloped Family," "The Overdeveloped Family," and "The Balanced Family." The Southern conference on Tomorrow's Children which met at Chapel Hill, N.C., also revealed this new emphasis in the planned family movement.

Most significant to the student of U.S. contemporary life was the continuation in 1940 of the constructive trends in the social, religious and educational programs for the conserving of marriage and the family. Although interest in strengthening marriage and the family was evident in the discussions of every conference dealing with social problems, the following meetings deserve special recognition: the Kalamazoo Conference on Family Relations, held in February at Kalamazoo, Mich.; the San Diego Conference on Family Relations at San Diego, Calif. in March.

Conference on Marriage Problems and Instruction held at Simmons college, Boston, Mass. in March; the Iowa Conference Family Relations at Cedar Rapids in March; the Sixth Annual Conference on the Conservation of Marriage and the Family held at Chapel Hill, N.C., in April; the New York State Conference Marriage and the Family held in New York city in April; the 11th Northwest regional conference at Seattle in May; the mid-annual meeting of the National Conference on Family Relations at Cincinnati in May; the Michigan State Conference on Family Relations at East Lansing in July; the Southern California Conference on Family Relations at Los Angeles in July; the Rocky Mountain Conference on Marriage and the Family at the University of Colorado in July; the Institute on Home Living at Ohio State university in July; the Conference on Education for Family Relations at the University of Wyoming in July. The final session of the White House Conference on Children in a Democracy, held in Washington in January, devoted 4 of its 11 sections to family and the child.

During 1940 in answer to the demands of college youth, courses in marriage were offered in colleges in various parts of the United States. Many colleges where such instruction was not given provided a course of lectures dealing with marriage and family problems. There was evidence that instruction in preparation for marriage in institutions where it was already established was becoming more practical, more factual in content and was more adequately making use of the contributions of the natural sciences. There was in 1940 a decided tendency toward including the practical consideration of marriage problems in courses on the family of the more conventional sociological type. The same had appeared in the instruction in family relationships offered in the departments of home economics. Interest in education for marriage in the high school also was slowly developing. The Yearbook of the American Association of School Administrators, in 1940, which advocates education for family life, will undoubtedly stimulate interest in preparation for marriage and the family among U.S. teachers and school administrators.

During the year 1940, provision for domestic counselling was increased by the Bureau of Marriage and Education for Social Family Relations, Inc. under the direction of Dr. Valeria H. Ker, 54 West 53rd street, New York city; the first marriage counselling organization in the south, the Marriage and Family Council, Inc., Gladys Hoagland Groves, director, Chapel Hill, N.C., with W. Clark Ellzey, 210 Cheyenne avenue, Colorado Springs, Colo., as its representative in the Rocky mountain area; the Marriage Embassy under the direction of Arthur Henry Schuch, 4846 North Sheridan road, Chicago.

There was no notable legislation relating to divorce but the effort to safeguard marriage by laws requiring prenatal and premarriage examination for the discovery and treatment of infec-

tious venereal disease continued. The law of Pennsylvania which became effective May 17, 1940, was typical of this legislation. It provided that no marriage licence might be issued without the certificate of a duly licensed physician that the candidate had had within 30 days a physical examination and serological test and was found free from communicable syphilis. A premarriage examination law of a new type went into effect in Virginia. Both applicants must be examined for syphilis and advised of its results, but having the disease does not prevent their getting a licence. The law assumes that they will in case of infection postpone the wedding and take treatment. Twenty-four states in 1940 had premarital examination laws. Three of these were passed during 1940.

Domestic relations were not much disturbed by the national program of military preparedness including the draft legislation, but as this program went forward and the scale of its operation increased, one of its consequences would seem to be reflected in an increase of domestic instability such as was experienced during the war of 1914-18. It was reported that there was a great increase of prostitution in certain communities in the vicinity of army encampments.

A study of the practice of the various Protestant churches with regard to remarriage of divorced persons was being made by the

Committee on Marriage and the Home, of the Federal Council of the Churches of Christ in America. The most contentious issue that appeared at the 1940 general convention of the Episcopal Church of America was whether there should be a change in the prohibition of the marriage of a divorced person. The proposal that those remarrying after divorce be admitted to Holy Communion was vigorously supported but finally defeated.

(E. R. G.)

Marshall, George Catlett (1880—), U.S. army officer, was born at Uniontown, Pa. on Dec. 31. Commissioned second lieutenant of infantry Feb. 2, 1901 after completing his studies at Virginia Military institute and the Army Staff college he advanced through the grades to brigadier-general in 1936. In 1902 and 1903 he served in the Philippines, also from 1913 to 1916. He was with the American expeditionary forces to France in 1917, on the general staff of the first division, as chief of operations of the first army and as chief of staff of the eighth army corps. After the war he was aide-de-camp to Gen. John J. Pershing for five years. From 1924 to 1927 he was stationed in China; in 1933 he was appointed commander of the Eighth infantry and in 1936 commanding general of the fifth brigade. On April 27, 1939 President Roosevelt appointed him chief of staff of the U.S. army with the rank of full general. In this office, throughout 1940, it was his duty to direct and co-ordinate the enormous load of activity that attended the first peacetime military conscription in U.S. history. General Marshall was an early supporter of the Burke-Wadsworth selective service bill and was present at its signature by President Roosevelt on Sept. 16. He had declared a month previously that the United States, to defend the western hemisphere, needed an army of 3,000,000 or 4,000,000 men.

Martin, Joseph W., Jr. (1884—), U.S. legislator and leader of the Republican party, was born at North Attleboro, Mass. Nov. 3, the eldest son in a blacksmith's family of eight children. After graduation from high school he became a reporter for the *Attleboro Sun* and the *Providence Journal*. In 1908 he became publisher of the North Attleboro *Evening Chronicle*, and four years later he was a member of the Massachusetts house of representatives. From this first political office he moved to the state senate and later (1922–25) he was executive secretary of the Republican state committee. Elected to the U.S. house of representatives first in 1925, Martin became well known as a shrewd parliamentarian and political strategist. After being elected Republican leader of the house in 1939 he solidified the minority party into a formidable opposition to the New Deal. Wendell Willkie selected Martin as chairman of the Republican national committee July 9 to succeed John D. M. Hamilton. After the election of Nov. 5 Martin announced his intention to retire from the office.

Martinique: see FRENCH COLONIAL EMPIRE.

Maryland, one of the original 13 states of the United States. Total area 12,300 sq.mi., land area 9,887 sq.mi. Population 1940 census 1,821,244, increase of 189,718 over 1930, 11.6% gain as compared with 7.2% increase for the U.S. Total urban population 1,080,351, rural population 740,893. Annapolis, capital, population (1940) 13,069; Baltimore, metropolis and seaport, population (1940) 859,100. Maryland has seven cities with populations of 10,000 or more. All increased during 1930–40. Eighteen of the 23 counties gained population. Greatest growth was in Montgomery county, which gained 70.5% as part of Washington, D.C. metropolitan area. Maryland ranks 28th in size

but 12th in population gain. Population density, 184.2 inhabitants per sq.mi.

State birth rate by residence for 1940 (11 months) was 16.0 (16.0 white, 21.0 Negro); for 1939 it was 16.7, 15.9 and 21.1 respectively. The death rate 1940 (11 months) was 12.2 (11.5 white, 16.1 Negro); for 1939, 11.5, 10.8 and 14.9 respectively. Infant deaths per 1,000 live births for 1940 (11 months) were 40.5.

History.—In the presidential election Roosevelt received 38,546 votes and Willkie, 269,544; the Socialist party, 3,967, Communist, 1,216; Labor, 635. Seven constitutional amendments and two state referenda were voted on in November. Four amendments and one referendum were approved. They provided for a People's court in Baltimore city and counties and an additional circuit judge; that salaries of judges and public officers be exempted from income taxes. A legislative act changing the State Industrial Accident commission was approved by referendum and reorganization was announced.

Agreement was reached between the State Road commission and Claiborne Annapolis ferry for the state to buy the bay ferry line. Further legislative action was necessary.

Senator George L. Radcliffe was re-elected, defeating former Governor Harry W. Nice. Democrats won all six congressional seats. The governor elected in 1938 was Herbert R. O'Connor.

Budget for the fiscal year ending Sept. 30, 1941 totalled \$35,790,173: \$21,800,430 from general funds, \$27,844,505 from special and debt service funds and \$1,145,237 from federal road funds. Federal contributions for schools, welfare programs, unemployment compensation, etc. raised the total federal funds to \$6,558,373, and \$10,000,000 state unemployment compensation made total funds of \$66,203,309 administered or controlled by state agencies.

Roads and Bridges.—The \$5,250,000 Potomac toll bridge connecting southern Maryland and Virginia was opened Dec. 19, 1938. Construction began Dec. 1938 under PWA grant, covering 41% of cost. The bridge is 2 mi. long, has 24-ft. roadway, 2 emergency footways, and 135-ft. clearance at high water. It is the only bridge across the Potomac south of Washington and provides a by-pass around Washington. The Susquehanna bridge at Havre de Grace and Perryville on route 40 was opened Aug. 1940. It cost \$4,900,000, has 4 traffic lanes, is more than a mile long, 7,618 ft. between abutments and will be 89 ft. above mean low tide.

Education.—Average total enrolment in the public elementary and high schools (1939–40) was 297,031, of which 61,068 were Negro. There were 228,267 enrolled in elementary schools and 68,764 in high schools and vocational schools. Catholic enrolment 1938–39 was 47,788, and other private schools 6,802. The State School Survey committee created by the legislature was given \$12,000 to make a comprehensive report on educational facilities to the next session of the general assembly.

Banking and Finance.—State banks and trust companies (114) had resources (June 29, 1940) of \$400,180,266 compared with \$393,474,443 for Dec. 30, 1939; deposits \$350,691,370 in 1940 and \$344,825,735 in 1939. Mutual savings banks (12) in June 29, 1940 had resources amounting to \$256,024,708 and deposits of \$228,012,720 compared with \$252,869,222 and \$218,137,771 for 1939. National banks (63) had resources of \$43,902,000 on June 29, 1940 and deposits of \$411,055,000 as compared with \$420,180,000 and \$387,285,000 respectively in 1939.

Agriculture, Minerals and Manufactures.—Total acreage of all field and truck crops in 1940 was 1,679,200; 1,657,000 in 1939. Farm crop value in 1940 was \$46,759,000 and \$45,163,000 in 1939. The cash income from sales amounted to \$65,702,000 for 1940 and federal subsidies were \$2,203,000. Oyster production for 1939–40 season was 3,129,270 bu. as compared with 2,136,940

the preceding season; hard crabs (1939) 246,967 bbl. and crabs and peelers by number 12,924,276.

The total value of minerals mined in the state in 1938 was 407,723; coal mined was valued at \$2,705,000 for 1,570,000 tons. In 1939, 1,306,000 tons were mined. The value of manufactures in 1939 was \$1,027,354,074, a decrease of 6.25% from 1937 figures. Wages paid in 1939 were \$156,782,654 as compared with \$156,995,227 in 1937. Wage earners numbered 141,733 (1939) as compared with 145,932 (1937).

Defence Program.—Allotments for the defence program in Maryland totalled \$285,837,400 from July 1–Nov. 30, 1940, including army and navy contracts, WPA defence programs and defence training. A \$13,000,000 construction program to accommodate 26,000 men at Fort George G. Meade is scheduled for completion by Feb. 1941. A Maryland Council of Defense and Resources was organized in Aug. 1940, W. Frank Roberts, chairman. (C. B. S.)

Masonic Order. **Antiquity.**—The year 1940 was marked by the publication, in England, (*A.Q.C. Trans.*, 5) of the "Graham Ms.," presented before Quatuor Coronati (research) Lodge No. 2076, London, with the statement that it "the most important document which we possess among the material surviving for the student of Masonry from the 'ritual' point of view" and "is so revolutionary in the way in which it cuts across so many established notions that it may be a very long time before we are able to form any adequate judgment as to its real position." The ms. bears the ambiguous date 176 but is found to have been reprinted in part in another Masonic work published in 1725. The ms. is claimed to have exploited, earlier than any other now extant, what is termed in Masonry the "Pyramic Legend," which, therefore, "was known in the Craft in its amplest form at least 21 years before the formation (1717) of the Grand Lodge of England."

Discussion of the paper accompanying and analyzing the ms., developed that it is (1) "an operative ritual," i.e., actually used by artisans of the builders' guilds from which modern Freemasonry arose; (2) "an itinerant ritual," used by those who travelled about; and (3), "a Christian ritual," for the "Masonry of St. John" as distinguished from that of Melchizedek, to which Mohammedans and other non-Christians adhered. The ms. is reproduced in lithographed form in the publication above mentioned, together with a printed copy, the accompanying paper and comments of those members of the lodge who participated in the discussion.

Universality.—The year's conquests of the totalitarian armies of serious inroads upon the order's ranks, those of Spain (*q.v.*), Yugoslavia, France and The Netherlands having been the latest victims. But in the democratic countries, despite (or perhaps because of) the war, Masonry flourishes. The Grand Lodge of England, whose constituent bodies are found in many lands, has maintained a rate of growth which makes it, according to a recent report, "the largest body of symbolic Freemasonry in the world." Thus this mother Grand Lodge is the outstanding symbol of Masonic universality. With a membership estimated at 450,000, and growing rapidly, it had, according to the latest available figures, 5,056 subordinate lodges, distributed over most of the civilized world. Due to the exigencies of the European war, the premier Grand Lodge felt compelled to adopt, at its quarterly communication on March 6, the following resolution submitted to the Board of General Purposes: "No brother being a national of any state with which Great Britain is at war, shall attend or be admitted to any Masonic meeting held under English constitution." And despite the dictators, King Gustavus V continued to be Grand Master of Swedish Masons; King Christian X of the

Danish; while the duke of Kent, brother of King George VI and Grand Master of English Masons, left his service at the front long enough to preside at the annual festival of the premier Grand Lodge on April 24. The nine provincial Grand Lodges of Canada, which are independent of the former, reported 168,951 members distributed among 1,379 subordinate lodges. In the United States, all of the major party nominees for president and vice-president were Masons, President Roosevelt being of the thirty-second degree and a Shriner, while three of his five appointees to the supreme court (Black, Reed and Douglas) are members of the order. The 50 American Grand Lodges reported 15,567 subordinate lodges and 2,489,587 members.

Massachusetts, one of the thirteen original states of the United States, popularly known as the "Bay state"; area, 8,266 sq.mi.; population according to U.S. census of 1940, 4,316,721; capital, Boston, population according to U.S. census of 1940, 770,816. Of the state's population 89.4% live in cities and towns of more than 10,000 inhabitants. The 1930 census showed 4,192,926 whites, 52,365 Negro; native born, 3,194,978; foreign born, 1,054,636.

History.—The Republicans, led by Governor Leverett Saltonstall, completed in 1940 their second year in control of the executive department of the state after six years of Democratic rule. In Nov. 1940, Governor Saltonstall was re-elected. In the presidential election Roosevelt (Dem.) secured 1,076,522 votes; Willkie (Rep.) 939,700; Thomas (Soc.) 4,091; Browder (Com.) 3,806; Aiken (Soc. Labor) 1,492; Babson (Prohibitionist) 1,370. On Jan. 2, 1941, Gov. Saltonstall was inaugurated with the following elective officers of the commonwealth: lieutenant governor, Horace T. Cahill; secretary, Frederic W. Cook; treasurer, William E. Hurley; attorney general, Robert T. Bushnell; auditor, Thomas J. Buckley. The legislature, biennial, elected for two years, consists of a senate of 40 members, 25 Republicans and 15 Democrats and a house of 240 members, 143 Republicans and 97 Democrats. The combined legislature is known as the general court, a term dating back to the "General Court of Assistants," under the charter of the Massachusetts Bay company in 1630. No legislative session was held in 1940, under the biennial plan adopted in 1939. The 1941 session opened on Jan. 1.

Reporting on the changes during his first two years of administration, ending Dec. 31, 1940, Governor Saltonstall noted that, mainly because of substantial reduction of the state's tax burden on municipalities, 215 of the 351 cities and towns of the commonwealth had reduced their tax rates in 1940, the biggest general reduction in 30 years or more. Taxes on manufacturing industry in Massachusetts were reported to be the lowest of any of the leading industrial states. Industrial employment during the two-year period increased more than 10% and the total of industrial wages more than 20%. The two years, 1939 and 1940, brought a total of 681 new industrial concerns and concerns requiring substantial expansion.

State debt during the two years was cut \$19,000,000, nearly one-half, the largest reduction in 40 years. Flood control work was completed by the state on 600 miles of streams in addition to the undertaking of two large flood control reservoirs in the Connecticut river drainage area by the federal government. In addition to flood control work, Quabbin reservoir, covering 39 sq.mi. and providing water supply for metropolitan Boston, had by Jan. 1, 1941 been completed. Also completed was the aqueduct from Quabbin to Wachusett reservoir, a distance of 24.61 miles and the second longest continuous tunnel in the world.

Hurricane damage of Sept. 1938 had largely been repaired—320,000,000 board feet of timber salvaged, representing a value of perhaps \$3,500,000 to landowners.

Labour relations were good. Since 1937 Massachusetts had about the best record of lost time from strikes per number of people employed of all leading industrial states. National defence program found Massachusetts in the first line. The state has built up one of the largest national guards of any state in proportion to population and in providing armament equipment and supplies the commonwealth stood, in 1940, among the five leading states, as measured by government armament contracts awarded. At the 281 vocational schools in 85 different cities and towns of the state, more than 50,000 people were receiving training, much of which was directed to needs of the defence program.

Education.—According to the latest available statistics from the department of education (June 1940) the public day schools of Massachusetts had an enrolment of 700,305, with an average daily attendance of 629,550. This represented a slight decrease from the previous year. In addition, there were 26,480 pupils in the public evening schools and 1,274 in the public vacation schools. The total amount of money expended for the support of the public schools was \$69,818,825.88, of which \$50,259,949.78 was devoted to salaries and \$759,573.78 to textbooks.

Under the law education is free. One of the greatest improvements in the laws affecting children came as a result of the passage of a bill which increased the school-leaving age for most children from 14 to 16 years. Massachusetts maintained a state college at Amherst, a state nautical school, a school of art in Boston, three textile schools and teachers' colleges at Bridgewater, Fitchburg, Framingham, Hyannis, Lowell, North Adams, Salem, Westfield and Worcester. In addition it supported a division of university extension, and a division of vocational education. It also awarded state scholarships to deserving students, who are children of World War veterans, in several private colleges and universities. In the year ending Nov. 30, 1939, the state teachers' colleges had an enrolment of 2,642 women and 635 men. The number of people registered for university extension courses was 34,457.

Massachusetts also has many important private institutions of higher education, among them Harvard, the oldest university in North America, Amherst, Williams, Massachusetts Institute of Technology, Clark, Boston college, Holy Cross, Boston university, Tufts, Northeastern and Worcester Polytechnical institute. Institutions for women include Emmanuel, Mount Holyoke, Radcliffe, Regis, Simmons, Smith, Wellesley and Wheaton colleges.

Charities and Correction.—Supervision of the state institutions is divided among several departments. The commission of Correction has charge of the state prison at Charlestown, the Massachusetts reformatory at Concord, the Reformatory for Women at Framingham, the State farm at Bridgewater and the Norfolk prison colony at Norfolk and supervision over the county houses of correction.

Under the jurisdiction of the department of Mental Health are state hospitals at Boston, Worcester, Taunton, Northampton, Danvers, Westborough, Medfield, Monson, Gardner, Waltham, Wrentham, Foxborough and Grafton, as well as the Boston Psychopathic hospital, the Belchertown State school and the Hospital Cottages for Children at Baldwinville. The department of Public Health supervises a number of sanatoriums.

Banking and Finance.—The state commissioner of banks had under his supervision as of Oct. 31, 1940, a total of 883 banking institutions, including 192 savings banks, 72 trust companies, 183 co-operative banks and 436 credit unions, besides a few private banks. On that date the institutions above listed had assets aggregating \$4,719,763,233. According to the commission

of administration and finance, the state's net direct debt at the end of 1940 stood at \$23,168,898.72. This represented a decrease of \$8,197,191.41 during the year. The leading sources of revenue were motor vehicle licences and gasoline taxes, \$512,078.88; federal grants, \$25,852,010.66; corporation and miscellaneous taxes, \$13,731,024.40; assessments on cities and towns, \$16,000,000. Total receipts for the year were \$124,817,539. Total expenditures, \$123,200,427.88. The assessments noted were in part offset by a grant of \$9,600,000 each year to municipalities for highway improvement.

Agriculture, Manufactures, Mineral Production.—During 1940, according to the statistics of the United States department of agriculture, the state raised: 9,281,000 lb. of tobacco, 325,000 bbl. of cranberries, 246,000 bu. of grain corn, 273,000 tons of silage corn, 2,174,000 bu. of (commercial) apples, 594,000 tons of hay and 238,000 bu. of oats. Total crop acreage for 1940 is estimated at 497,050 ac., an increase of 6,400 ac. from 1939. The production of milk in 1939 totalled 804,190,000 lb. Livestock on farms in 1940 included 141,000 milk cows, 100,000 hogs and 7,000 head shorn sheep, which gave 42,000 lb. of wool in 1940.

With respect to manufactured goods, statistics for 1938 show the value of the state's leading products as follows: boots and shoes, rubber, \$16,658,838; boots and shoes, other than rubber, \$132,964,607; paper boxes, \$24,735,850; bread, \$79,255,214; women's clothing, \$43,987,205; cotton goods, \$66,988,947; dyed and finishing textiles, \$47,900,883; electrical supplies, \$92,200,000; foundry and machine-shop products, \$63,703,683; leather goods, \$48,668,597; paper, \$55,447,418; printing, \$83,046,915; rubber goods, \$48,351,026; total \$2,054,865,331. The number of industrial establishments in the state in 1939 was 9,006, the average number of wage-earners employed was 459,877 and the value of manufactured products \$2,457,599,210.

Fishing is still one of the state's leading industries. In the twelve months ending Dec. 1, 1938, about 381,000,000 lb. of fish valued at \$8,573,275, entered the ports of Boston and Gloucester and were distributed therefrom. Total value of all kinds of marine fish and shellfish landed in Massachusetts, \$11,476,000.

The chief mineral products and their 1936 values were: coal, \$6,048,544; clay, \$953,655; lime, \$1,193,429; and stone \$3,208,58. In 1939 sand and gravel to the value of \$794,589 were extracted. (L. SL.)

Massachusetts Institute of Technology.

While continuing its program of technological education and research as efficiently and uninterruptedly as possible, the institute was asked in 1940 to undertake a steadily increasing volume of work for national defence. Defence work is being conducted in a majority of its departments, mainly through contracts with the war and navy departments, the national advisory committee for aeronautics, the national defence research committee and the national academy of sciences, and with private companies engaged in development of equipment for defence purposes.

Members of the institute's staff are serving in a variety of defence agencies, some having been granted leaves of absence and others having been relieved of a portion of their institute duties to enable them to serve. Special instructional work has also been undertaken or planned. In the summer of 1940, as a part of the program and to meet an immediate need for men, the institute offered without tuition charge a ten-weeks' intensive course to train junior aeronautical engineers. Other courses of this kind are also being developed as a part of the federal program of short intensive courses in engineering schools. The special training in meteorology begun in the summer of 1940 for air corps cadets is being continued, and the institute again has participated in the

ilian pilot training program.

The institute's operating budget for the year 1939-40 totalled \$333,000; the gifts received totalled \$790,559; its educational assets stood at \$16,328,000, an increase of \$332,000 during the year; and the book value of its endowment funds totalled \$5,012,773, a decrease of \$217,000 during the year.

Enrolment for the academic year 1940-41 totalled 3,138, of which 759 are graduate students, a further gain over 1939's high enrolment in the graduate school. Seventy per cent came from outside Massachusetts, 63% from outside the New England states, 34% from outside the North Atlantic states and 7% from outside the U.S. There are 224 foreign students, from 46 foreign countries.

(K. T. C.)

Mathematics.

Mathematicians of the United States, under the direction of Professor Marston Morse as chairman of the War Preparedness committee appointed by the American Mathematical society and the Mathematical Association of America, launched a program in 1940 with three objectives: (a) solution of research problems arising in the national defence program; (b) preparation of students for research on problems in (a); (c) solutions of problems relating to mathematical training for the services. In addition, the committee listed officials in placing mathematicians called into service in positions of maximum usefulness. Chief consultants, to direct research on problems arising in the defence program, were appointed in the fields of ballistics, aeronautics, mechanical and electrical aids to computation, industry, cryptanalysis, and probability and statistics. The War Preparedness committee called a renaissance of the study of applied mathematics. In keeping with this appeal there was a symposium on aeronautics, dealing with mathematical problems in meteorology and in aeroplane design and flight, at a meeting of the A.M.S. in Los Angeles Nov. 23.

Computing machines, capable of performing more and more complicated mathematical operations and increasingly important applied mathematics and engineering, are being constructed in greater numbers. Two will serve as samples of progress in 1940. The Bell Telephone laboratories developed a computing machine for multiplying and dividing complex numbers. It is constructed largely of telephone relays and switches and is operated from a keyboard designed from a standard teletypewriter. Massachusetts Institute of Technology constructed a differential analyzer with 18 integrators.

The publication of mathematical journals throughout the world suffered from war. The following was the situation in brief, and nothing appeared, and it is unlikely that any of the former publications will continue. The Balkans: almost nothing was published. Scandinavia: publication continued, but perhaps more slowly. Italy and Russia: journals were published, but in great disorder, and it was difficult to obtain them. France: nothing appeared after the armistice. Germany and Switzerland: all journals were published and distributed regularly. England: publication was practically normal.

These conditions placed an added burden on mathematical publication in the U.S. Mathematicians are grateful to Duke University for increasing the size of the *Duke Mathematical Journal*. A new series of lithoprinted monographs, the *Annals of Mathematics Studies*, was established at Princeton university. Still more mathematical publications were needed in the U.S.; as a result, both the A.M.S. and the M.A.A. were attempting to establish new series—a financially difficult task.

The publication of books also was normal in England and the U.S. The following are representative of those published in England during 1940: *The Theory of Group Characters and Matrix Representations of Groups* by D. E. Littlewood; *Mathematical*

Papers: II. Dynamics of Sir W. R. Hamilton; *Elementary Cryptanalysis: A Study of Ciphers and their Solution* by Gaines. Books published in America include *The Foundations of Geometry* by Robinson in the Mathematical Expositions series of the University of Toronto press; *Lattice Theory* by G. Birkhoff and *Gap and Density Theorems* by Levinson in the Colloquium Publications series of A.M.S.; three volumes in the series *Annals of Mathematics Studies*; *Advances and Applications of Mathematical Biology* by Rashevsky; *Mathematical Methods in Engineering* by von Kármán and Biot. Germany, formerly a great publisher of mathematical books, issued little more than second editions of old ones.

The dispersion of mathematicians from Europe continued. The new arrivals in the U.S. during 1940 brought the total number there to about 100; nearly three-fourths of them had been absorbed in the colleges and universities. It has been said that more of the leading German mathematicians were in 1940 in the U.S. than in Germany.

The year was fertile of new results in all fields of research; reviews of papers containing them can be found in *Mathematical Reviews*, vol. 1 (1940). Reviews of books and news items can be found in *Mathematical Gazette*, *Bulletin of the American Mathematical Society*, and *American Mathematical Monthly*.

(G. B. P.)

Matter, Structure of.

The most notable contributions in 1940 were to the knowledge of the nuclei of atoms and their properties. The process of nuclear "fission" was further investigated. This new phenomenon, whose discovery was one of the outstanding events of the year 1939, consists in the splitting up of the three heaviest elements—uranium, protoactinium, and thorium—into two different lighter elements as a result of neutron impact. During 1940 it was found that the fission of thorium and uranium could also be brought about by gamma rays and by deutron impact. It was shown that the light rare isotope of uranium, U^{235} , was responsible for the fission usually observed with slow neutrons. The heavy isotope is affected only by fast neutrons. Uranium may absorb neutrons of intermediate velocity and transform into a transuranium element (number 93). This in turn changes into element 94, in which no radioactivity has as yet been observed. The existence of at least two chemical elements beyond uranium has thus been satisfactorily verified.

The question whether the atomic energy set free in the fission process can be made available by devising conditions under which the process once started would be self maintaining involves the quantitative study of many fundamental phenomena, about which there was in 1940 no adequate information. Considerable time will probably be required before the question of the possibility of developing atomic power in this manner can be decided.

Cosmic Rays.—In 1940 further information about the mesotron constituent of the cosmic rays was obtained. Its instability was demonstrated and its mean lifetime was determined to be approximately 2.8 millionths of a second. During the year a cloud chamber photograph was obtained which showed the actual transformation of a mesotron at the end of its life. A positron was formed with about half the energy, the rest of the energy presumably going into a neutrino. The mesotrons are produced in the upper atmosphere, probably by charged particles from outside the earth, whose nature is still unknown. In warm weather the atmosphere extends to high altitudes, and the mesotrons, being produced at greater distances from the earth, are consequently weaker at the earth's surface. Considerable progress was made during 1940 in analysing the complex effects due to cosmic rays at different altitudes, and attributing them to various processes: fast "knock-on" electrons are produced by mesotron

ONE OF SCIENCE'S most momentous discoveries came to light in 1940 when Dr. Alfred O. C. Nier, young physicist of the University of Minnesota, announced his success in isolating U-235, a radioactive derivative of uranium with an explosive force 30,000,000 times that of T.N.T. Dr. Nier in the photograph is pointing out a part of the spectrometer used to isolate U-235

impacts; "showers" of positrons and electrons are produced by photons or electrons resulting from the decay of mesotrons.

Isotopes.—During 1940 several attempts were made to separate the isotopes of various elements in considerable quantity; these met with much greater success than any previous attempts. The most striking was the separation of sufficient U²³⁵ from uranium to demonstrate that it is this isotope that is responsible for the phenomenon of fission produced by the absorption of slow neutrons. For this, 4.4 micrograms of uranium were separated into isotopes by the methods of mass spectroscopy in which the different atoms are deflected in a vacuum by a magnetic field.

Samples of carbon were prepared with an increased proportion of the heavy stable isotope at mass 13, which normally occurs only to the extent of 1% of the abundance of the main isotope at mass 12. By chemical means a five-gram sample was prepared containing 23% of carbon 13. Also an 8-gram sample of nitrogen was prepared with 70% of the heavy nitrogen isotope at mass 15 in place of the normal 0.4%. Such samples may be built up into hydrocarbons which are distinguished by their mass from the ordinary forms. These then may be used in biological experiments as tracers.

An interesting example of modern alchemy was the preparation of a sample of mercury containing only the isotope of mass 198 in place of the usual mixture of seven isotopes. This was prepared by the artificial transmutation of gold into mercury. A neutron was added to the gold, which then changed spontaneously by β -ray emission into mercury. A sufficient amount was prepared in this way to study the details of the spectrum.

Turning to new radioactive forms of the elements, a long-lived radioactive isotope of carbon of mass 14 was prepared. This form of carbon should be especially useful in biological investigations. Unfortunately, its radiation is not very penetrating, and requires special methods for its measurement. A radioactive form of the missing element 85 was prepared from bismuth and its chemical properties studied. This left only element 87 still unknown in 1940. A long-lived isotope of yttrium was prepared by bombarding strontium with deuterons, which emits gamma rays almost identical in penetrating power with those from radium.

Cyclotron.—During the year, work was commenced on "super" cyclotron much larger than any in operation and designed to accelerate singly charged atoms up to potentials of 100,000,000 volts. Its construction will extend into a new range the known principles of high frequency, high voltage, electrical engineering and its successful completion will make possible a new range of studies of atomic transformation. (See also PHYSICS.)

BIBLIOGRAPHY.—Papers on fission and mesotrons appeared in the *Physical Review*, vols. 57 and 58. For radioactive and stable isotopes, see the same journal and the *Journal of Chemical Physics*. (A. J. D.)

Matthews, Mark Allison (1867–1940), U.S. clergyman, noted as the pastor in Seattle, Wash., of one of the largest Presbyterian churches in the world, was born in Calhoun, Ga., Sept. 24. He studied in Calhoun academy, began to preach at the age of 19 and was ordained when he was 20. He served as pastor of churches in Georgia and Tennessee until 1902 when he went to Seattle as pastor of the First Presbyterian church with 400 members, which under his leadership grew to 7,500. He was admitted to the bar in 1900, but seldom practised law. In Seattle he fought vice and political corruption and brought about the conviction of the chief of police. He was elected moderator of the Presbyterian General assembly in 1910 and later served as a member of its general council. He died in Seattle, Feb. 5.

Mayo, Katherine (1867–1940), U.S. author, was born in Ridgeway, Pa., and was educated in private schools of Boston and Cambridge, Mass. She lived with her father, a mining engineer, in Dutch Guiana for eight years and her first published writings were descriptions of life in that part of the world. In 1910 she collaborated with Oswald Garrison Villard on his book *John Brown* and with Horace White on *The Life of Lyman Trumbull*. In 1917 she published a book on the lack of police protection in the rural regions. Her most famous book, *Mother India*, was published in 1927. Two years earlier she had written *Isles of Fear*, an exposition of conditions in the Philippines. She died in Bedford Hills, N.Y., Oct. 9.

Meat. Of somewhat larger interest in the meat industry's activities in the United States in 1940 was the augmented trend toward processed meat foods—sausage, canned meat, sliced bacon and meat loaves. The meat packers' year ends Sept. 30. For the packing-house year ending Sept. 30, 1940, the volume of processed meat foods broke all previous records.

Trade publications attributed the increased consumption to special advertising campaign sponsored by the American Meat Institute, formerly the Institute of American Meat Packers. An unusually large number of hogs and cheap prices for pork also contributed. Table I shows the production of processed meat foods at federal-inspected packing houses for the packers' year ending in 1940 and 1939.

Slaughter of cattle, calves and sheep in the United States

Table I.—U.S. Production of Processed Meat Foods, 1939 and 1940

	1940 lb.	1939 lb.
All sausage	846,820,000	793,511,000
Fresh sausage	133,638,000	106,528,000
Smoked sausage	593,873,000	566,110,000
Dried sausage	119,310,000	110,864,000
All canned meats	721,244,000	581,392,000
Meat loaves	118,221,000	106,478,000
Sliced bacon	313,119,482	266,815,000

Table II.—Slaughter of Meat Animals in U.S., 1939 and 1940 (10 mos.)

	1940 head	1939 head
hogs	38,915,660	31,694,605
sheep	14,468,471	14,383,531
cattle	8,014,806	7,835,584

1940 was at about the same level as in 1939, but there was a considerable increase in the slaughter of hogs. Table II shows the slaughter at federal-inspected plants for the first ten months of the calendar years of 1940 and 1939.

Disparity between beef and pork prices was unusually wide during 1940, fat steers selling for twice as much per 100 lb. as 1935. Imports of cattle and beef into the United States declined sharply during the year. For the first nine months of 1940 imports of cattle and beef, on a dressed weight basis, were 259,000,000 lb., a decline of 27% under the same period in 1939. Of these imports 125,000,000 lb. were from Canada and Mexico. In the same period canned beef imported from South America totaled 50,802,000 lb. compared to 69,656,000 lb. in the corresponding months of 1939. United States exports also declined drastically from 60,099,000 lb. of cured pork exported the first nine months of 1939 to 28,247,000 lb. exported in 1940. Lard exports for the same period in 1939 were 213,557,000 lb., but dropped to 168,585,000 lb. in 1940. At the beginning of the new marketing year, Oct. 1, 1940, United States stocks of lard were 2,259,000 lb. compared with a five-year average of 45,106,000 lb. on that date. During 1940 the Federal Surplus Marketing Administration contracted to buy 130,740,000 lb. of lard and 2,699,000 lb. of pork. (S. O. R.)

Medical Association, American: see AMERICAN MEDICAL ASSOCIATION.

Medical Association, British: see BRITISH MEDICAL ASSOCIATION.

Medicine. Outstanding among medical discoveries in 1940 were those related to chemotherapy, the vitamins and the glands. In the treatment of disease, first place was held by the sulphonamide group of drugs. A new drug, called phenylglyguanidine, was developed and found to be especially useful in relation to infections within the intestines. The drug is slowly absorbed from the bowel and was, therefore, found to be especially useful in the treatment of various forms of infectious sentery.

Many researches were concerned with an attempt to understand the manner of action, and it was agreed that the effect of these drugs is not due to their ability to destroy germs, but to their ability to prevent germ growth. New methods of application involved the combination of sulphanilamide and hyperthermia, used in a cabinet, for the treatment of gonorrhoeal infections and undulant fever.

In prevention of infection in war wounds, sulphanilamide sprayed directly on the wound was recommended and agencies are developing special devices for sprinkling sulphanilamide in this manner. Sulphanilamide was also fully established as the ideal treatment for trachoma and innumerable cases were prevented by this technique.

In the treatment of arthritis, preparations of gold were again used, involving new salts and gold in larger dosages with indication of value in a limited number of cases.

Drs. Saphir and Howell announced the use of iodophthalein to eliminate typhoid germs from the bodies of those known as typhoid carriers.

The most extraordinary technique suggested in 1940 was exposure of phosphorus to the cyclotron for the preparation of

radioactive phosphorus which could then be suitably prepared for injection directly into the blood stream. This method was reported effective in lowering the number of white blood cells in cases of leukaemia. Radioactive strontium, similarly prepared, was used in the treatment of cancer.

In New York, experiments were made with the five-day treatment of syphilis, using slow intravenous injections of a preparation of mapharsen. Toxic effects indicate some danger in this method, but successful results are a promise for complete control in the future. Workers in Leland Stanford university developed a product called sobisminol for the oral treatment of syphilis in selected cases.

Investigators also suggested the use of curare, a poisonous substance from South America, for the treatment of Parkinson's disease, or shaking palsy. Apparently this is effective in a limited group of cases of different types, presumably those in which the palsy develops following encephalitis.

Special attention was given to the use of prostigmine for gangrene due to interference with circulation of the blood. Prostigmine acts on blood vessels to prevent spasms.

The release of histamine in the blood was found to be associated with headaches, with certain allergic disturbances and with Ménière's disease, a form of vertigo. Some investigators reported success in controlling such manifestations by desensitizing patients with a product derived from histamine, obtained from the intestines of the hog and called histaminase.

Complete studies dealing with fatigue indicated that gelatin cannot be depended on to overcome fatigue and that amphetamine or benzedrine will produce increased stimulation but not prevent fatigue. The League of Nations issued an official report concerning all of the different techniques developed for doping in order to encourage better performances from athletes and soldiers. A complete survey indicated that rest is the proper treatment for fatigue and that the only successful doping technique involves the use of cocaine and its derivatives, which, however, causes addiction and so is forbidden by law.

Vitamins.—New studies of the vitamins established fully the use of nicotinic acid as a preventive substance in pellagra, but Spies and his associates showed also that this deficiency is associated with a deficiency of the other portions of the vitamin B complex, including thiamin, riboflavin, pantothenic acid and pyridoxine, as well as a deficiency of vitamins A and C.

Vitamin K was found to be especially useful in increasing the prothrombin in the blood in new-born infants. Many obstetric clinics recommended injection of the mother with vitamin K previous to the birth of the child and injection of the child immediately following birth as a means of controlling to some extent haemorrhage in the brain during and after childbirth. Other obstetricians advocated improvement in care during childbirth and especially warned against the use of pituitary preparations which too greatly hasten childbirth and contribute largely to the cause of such haemorrhages.

New studies showed that a subacute deficiency of thiamin is common in the United States. An insufficient amount of pyridoxine or vitamin B₆ was found to be definitely related to nervousness, insomnia, irritability and weakness. The vitamin P, isolated by Szent-Györgyi, was reported by Kugelmass as useful for certain haemorrhages occurring in infants. It does not affect fibrinogen or blood platelets, but is valuable when the haemorrhages are due to weakness of the capillary blood vessels. Most of this effective vitamin P may be obtained from eating lemon peel.

Especially significant in vitamin studies were comparative experiments on vitamins necessary for the growth of germs in cultures and the manner in which germs may be modified by varying

the vitamin content of cultures. Various vitamins, including thiamin and particularly vitamin E (tocopherol), were found to be useful in preventing and controlling various disorders of the nervous system, such as amyotrophic lateral sclerosis. Other investigators reported vitamin B₁ as especially useful in the treatment of shaking palsy. These experiments were not, however, confirmed. Presumably the changes taking place in the tissues as a result of the nervous disorders are permanent and cannot be overcome by the administration of vitamins.

Nicotinic acid was found to be useful in the treatment of trench mouth among soldiers in Great Britain. Foxes fed on a diet of fish developed an inflammation of the brain known as encephalomyelitis. When they were returned to a meat diet or when they were given thiamin, this condition disappeared. Apparently the fox does not secure the necessary thiamin from a diet of fish.

Glands.—New hormones were isolated from the pituitary gland. A synthetic substitute for the female sex hormone, known as stilbestrol, was found to be useful for deficiencies of this hormone. These sex hormones, when administered in the presence of deficiency, improve the general condition of the tissues and so much improved the gums as to be recommended for use in pyorrhoea in women.

An extract from the adrenal gland cortex, known as cortin, was found to be useful in the treatment of cases of shock. The male sex hormone, when used in women following childbirth, was found capable of preventing the flow of milk, a technique desirable when for any reason the child is lost or the woman finds it undesirable to nurse the baby. The male sex hormone was used with success in some cases of pain during menstruation.

A substitute for the adrenal gland hormone, prepared synthetically, known as desoxycorticosterone, was tried in shock and for various conditions in which muscular weakness was a prominent symptom, this weakness being apparently due to a lack of the necessary hormone.

Most significant in this field of research was the determination of the presence in the kidney of a substance called renin, which reacts with a substance from the blood known as angiotonin to raise the blood pressure. A blood-pressure lowering hormone was also the subject of experiments. These experiments derived from the work of Goldblatt who tied off the circulation of the blood to the kidney and thus produced high blood pressure.

Cancer.—Outstanding investigations in cancer were developed by J. F. Mencke, who by feeding fat soluble material derived from cancers of the breast was able to produce tumours in sensitized mice.

P. E. Steiner of the University of Chicago prepared extracts from the livers of persons who had died from cancer which, on injection into mice, also produced cancer.

F. M. Allen suggested tying off blood vessels deep in the tissues to destroy the blood supply of cancers and to control their growth in the body.

Zinc peroxide was recommended for the clearing of the debris associated with chronic ulcers and cancer.

Mohs reported that zinc chloride, long used in cancer pastes, could be made the basis of a substance which would fix cancer tissue and permit surgical destruction under the microscope.

Investigations made on the so-called freezing or artificial hibernation in cancer indicated the method to be without practical value.

Surgery.—War medicine focused new attention on the Orr treatment for compound fractures, in which the limb is encased in a plaster cast. This method was much used by Trueta during the Spanish civil war and was in 1940 generally accepted as the ideal method of treatment for this condition.

Sidney Smith of the University of Chicago suggested the use of

rods of sugar to fit blood vessels. These are coated with oil and used as a darning egg for sewing divided blood vessels together.

A. J. Cone of St. Louis recommended salt pork packs as a means of controlling haemorrhage from the nose when of known origin or when occurring excessively during operation.

R. A. Griswold developed a new technique for fractures involving a double pin fixation of the bones.

Throughout the world it was established that blood plasma was valuable for shock, whether from wounds or from burns. The Red Cross engaged in a nation-wide effort to collect plasma for shipment to Great Britain. New devices were developed for drying plasma for use on naval vessels and for shipment.

In order to eliminate postoperative embolism or the travelling of blood clots from wounds to tissue near the heart or the brain, Drs. DeTakats and Jesser recommended raising the foot of the bed with the use of pedalling exercise.

L. A. Peer tried the cartilages from the ribs as material for repairing defects in the skull following injury and found this satisfactory.

In serious haemorrhages, Morrison and Samwick transfused blood directly into the bone marrow and reported successful results in some cases of leukaemia. This work is still in an early experimental stage.

Nervous System.—The hypothalamus was again the centre of interest, relating the emotions to thought and motor activity. The regularity of breathing, the constancy of the pulse, the maintenance of temperature, the intake and output of fluid, the cycles of sleep and all the periodic functions of the body are controlled through the hypothalamus.

Most prominent among nervous and mental conditions were shell shock and anxiety neuroses precipitated by the war. Nevertheless, the increase in mental disease was found to be less than one-fourth of one per cent per year.

Especially important was the work on infantile paralysis stimulated by the National Foundation for Infantile Paralysis. The funds made available through this organization have extended opportunity for experimentation with this disease. Fatigue of the muscles inclines toward greater paralysis when a child is infected.

The incubation period for equine encephalomyelitis was shown by F. C. Helwig to be 14 days in the case of a laboratory worker who was accidentally inoculated with this virus. A serum was developed and found useful in controlling this disease.

The use of electric shock was added to insulin and metrazol shock as a means of controlling mental disturbances.

New studies with the electro-encephalograph added new impressions regarding the nature of epilepsy.

Psychiatrists generally began to pay more attention to psychosomatic methods, in which bodily disturbances were related to mental disorders.

Investigators continued to study the surgical removal of small portions of the frontal lobes of the brain as a means of controlling certain depressive states.

Nutrition.—In addition to the work with the individual vitamins, a special study of spinach indicated that only 20% is available for the body and that spinach contains another radical known as oxylate radical, which has the disadvantage that it precipitates calcium into the body and carries it away.

Another investigator suggested seriously the eating of grass as a source of all vitamins, but the method was not generally adopted.

Great Britain recommended a bread fortified with thiamin and calcium for the majority of its public.

In the United States greater utilization of whole wheat bread was recommended and fortifying of bread with proteins, nicotin

l, calcium, iron and phosphorus, according to the deficiencies of various sections of the country.

For diabetes, authorities recommended fasting and fat feeding, as well as insulin injections, as a means of allowing the islands of the pancreas to rest; in other words, to regenerate.

Biologic Preparations.—Specific serums for new forms of pneumonia were found and, combined with sulphonamide drugs, led to lower death rates from pneumonia from 20% to 30%.

E. K. Knott suggested that a small amount of blood be withdrawn from a vein in the arm, mixed with citrate solution, irradiated with ultraviolet and reinjected into the body. The method was not considered as established.

Joseph Stokes developed a new vaccine for measles by raising the virus of measles in the embryos of chickens within eggs. This vaccine was reported to be useful in lowering the incidence of measles in an institution for children.

Hersfall, of the Rockefeller institute, utilized a similar technique and was able to develop a vaccine against influenza by culturing chick embryo with a mixture of distemper and influenza, which will grow on this material. Human volunteers inoculated with the vaccine had their antibodies multiplied seventyfold. Subsequent inoculation with influenza virus seemed to show that they were protected against the disease.

An official report by a number of allergists indicates that the giving of extracts by mouth is not useful in the prevention of hay fever and asthma when it is a permanent sensitivity.

Skin Diseases.—Sensitivity to vinylite or elasti-glass wrist watch straps, garters and suspenders produced cases of dermatitis in persons found to be especially sensitive. Innumerable cases of skin sensitivity to the filler used in some forms of nylon hosiery were reported. Many men developed eruptions from the use of dyed shorts and socks.

In the treatment of psoriasis, investigators tested the use of massive doses of various vitamins and of many drugs, but without conclusive results.

Aviation Medicine.—Extended investigations in aviation medicine indicated lack of oxygen, lack of warmth and perhaps the high altitude as important factors in causing accidents. New techniques were developed for supplying a mixture of oxygen and helium and for reduction of air pressure by use of closed cabins. New devices were developed for aiding inhalation of oxygen by masks. The Collier trophy was awarded to Harry S. Armstrong, Walter Boothby and Randolph Lovelace for their investigations in this field.

Honours.—The distinguished service medal of the American Medical association was conferred on Chevalier Jackson for his contribution to the use of the bronchoscope for study of the lungs and for removal of foreign bodies. Dr. Frank Lahey of Boston was elected president of the American Medical association. Dr. Irvin Abell was made chairman of the Co-ordinating Committee for Health and Medicine in the campaign for war preparedness.

Literature.—Outstanding literary contributions were the autobiographies of Hans Zinsser, J. H. J. Finney and Hugh Young.

Miscellaneous.—Marshall Jennison of the Massachusetts Institute of Technology photographed a sneeze, showing that every sneeze spasm expels droplets 250th of an inch in diameter, heavy with millions of germs and with a muzzle velocity of 150 ft. a second.

Isaac Starr of the University of Pennsylvania developed a balotocardiograph to measure the energy discharge of the heart.

The maternal death rate of the United States for 1938 was the lowest ever recorded in the United States. Infant death rate was lower in the U.S. than in Great Britain.

The number of physicians increased by 1,379 during 1939.

WAR'S ANCIENT MEDICAL PROBLEM of sufficient blood supplies for emergency transfusions was overcome in June 1940 by a group of Philadelphia physicians who perfected a method of transforming blood serum into a powder which can be stored indefinitely. After mixture with sterile water, the serum powder can be injected into a patient with any type of blood. The powder on the plate at the left in the picture is the equivalent of the 400 c.c. of blood in the flask

The Dionne quintuplets had their tonsils removed because they all had tonsillitis at the same time.

Most suggestive research of 1940 was the discovery that a metallic substance could be made radioactive, injected into the body and followed by use of the X-ray to its ultimate place in the body.

As the year 1940 ended, a new epidemic of influenza was spreading across the United States, and was found to be of a milder type and different strain than the serious epidemic of influenza in 1917-18. Socialized Medicine.—State-wide or district voluntary insurance organizations for the collection of premiums from persons with modest or low incomes, to meet the cost of medical care, have been established in California, Utah, Michigan, Wisconsin, Pennsylvania, New York, New Jersey and the District of Columbia. Ten or more other state medical societies have been giving this subject careful consideration. These insurance arrangements sponsored by state medical societies are recognized as experiments. They are proceeding with the understanding that changes may be required as experience is gained. The period of operation has been too short, at this time, to express any opinion as to their success in supplementing the private practice of medicine.

The insurance principle has been used and was being urged in 1940 by other organizations either independently or in co-operation with medical societies. The Farm Security administration, department of agriculture, has sponsored a large number of local arrangements designed to enable the clients of the administration to meet with funds the minimum medical costs. As of Jan. 1939, medical societies in 30 states were co-operating with the Farm Security administration in the organization of medical care plans for low income farm families.

The state and district medical society insurance arrangements and the Farm Security administration plans are based on the use of fee schedules of approximately 50%, or slightly more, of the customary medical fees. Physicians who serve these insured persons are, therefore, making a very definite contribution to the success of these experiments.

From other sources there is urged a type of organization for the distribution of medical care under the name of "co-operative" or "group" medicine.

A study of 335 medical groups throughout the United States was completed by the bureau of medical economics of the American Medical association. Only 17 of the 335 groups reported that they were offering some general type of prepayment contract to the public to cover the cost of medical care. (R. G. L.)

Mediterranean, British Possessions in: see BRITISH POSSESSIONS IN THE MEDITERRANEAN.

Mental Diseases: see PSYCHIATRY.

Mercury. World production of mercury is estimated at 4,600 metric tons in 1937 and 5,200 tons in 1938, as compared with the record high of 5,610 tons in 1929. The leading producers are Italy, Spain and the United States; over the past 25 years, the distribution of the output has been one-third each from Italy and Spain (with Italy slightly in the lead), and one-sixth from the United States, the remainder being divided among a large number of minor producers, the chief of which are Mexico and the soviet union. The recent distribution is not greatly different from this, except that Italy has taken a greater lead over Spain. Since the beginning of the war in Europe, data outside of North America are not available.

Italian production was 2,300 tons in 1938, but the rate declined somewhat in the first half of 1939. Spanish production has not been reported since 1935, but exports were about 1,450 tons in 1938. Sixty years ago the United States supplied two-thirds of the world total, but the highest figure in recent years was 860 tons in 1931, dropping to 330 tons in 1933, and increasing to 642 tons in 1939. As a result of war demand, the U.S. output ex-

panded so rapidly that preliminary estimates indicate an output of 1,240 tons in 1940, against a consumption of 920 tons; imports ceased early in the year with only 6 tons, while exports will reach about 350 tons. United States imports in 1939 were only 133 tons, 10% from Italy, 16% from Mexico and 74% from Spain. Mexican output was 254 tons in 1939, against 293 tons in 1938. British empire production of mercury is limited to about 1 ton in Australia and New Zealand, but imports by the United Kingdom are heavy, the surplus of imports over re-exports being 1,035 tons in 1938, but only 33 tons in the first half of 1939. German imports are still heavier, 1,132 tons in 1938 and 465 tons in the first half of 1939. (G. A. Ro.)

Mesotrons: see MATTER, STRUCTURE OF; PHYSICS.

Metallurgy. The depression intensified the efforts to modify old processes and develop new ones which could continue to compete under the constantly lowering prices that then prevailed; in view of the coming years of intensified activity in connection with the defence program, one may anticipate similar efforts with the object of increasing production without unduly increasing the costs.

Alloys.—A new magnetic alloy (Vicalloy), containing 30-52% iron, 36-62% cobalt and 6-16% vanadium is said to be capable of retaining a higher degree of permanent magnetism than any other commercial material.

The researches of the U.S. bureau of mines on the utilization of electrolytic manganese have led to the development of a copper-manganese alloy which, when properly heat treated, has the strength and elasticity of mild steel, and a capacity for absorbing noise vibrations that approaches that of rubber; it is being tried out in noiseless gears and other types of use where the suppression of noise is desirable.

An alloy of electrolytic manganese with 2% copper and 1% nickel has ductility and other properties similar to copper, but can be heat treated to produce an electrical resistance 1,000 times that of copper. Another combination of the same metals has a wide range of hardenability, which can be so controlled that the inside of the metal may be as soft as copper, while the outside is hard as steel.

Casting.—A method was developed for the continuous casting of rods by allowing the liquid metal to flow from a containing reservoir through a tube which is cooled by an accurately controlled water spray. Used for the production of wire rods, this not only eliminates the rolling of the ingots into rods, but gives a superior product through the avoidance of segregation, blowholes and other flaws inherent in ingot castings.

Superfinish.—While much attention was given to superfinishing, especially as a treatment for bearing surfaces, this procedure was new only in its application to commercial products, the same principles being involved as had been used for the polishing of metallographic specimens.

Hardening.—The localized hardening of steel surfaces by flame hardening or by localized electric induction heating is expanding in its applications.

Grossman and Stephenson reported that the greater the hardenability of a steel, as determined by its chemical composition, the more the hardenability is affected by changes in grain size; hardenability can be increased as much as 50% by increasing the grain size.

Powder Metallurgy.—Starting only a few years ago with the consolidation of a metal powder by pressure and heat, there developed a well-established and rapidly-growing practice of powder metallurgy that has extended to the synthesis of a wide variety

ferrous and nonferrous alloys from the component metals in powder form. The resulting products have increased in size and complexity of form, and have expanded in range of composition and scope of application as the technique of production has progressed, until it seemed in 1940 that powder metallurgy was destined to take its place alongside diecasting as a simplifier of many metallurgical problems.

Progress was hampered in 1940 by the fact that much of the metal powder used has been of European origin, and future development will depend to some extent on the success with which interrupted foreign supplies can be replaced with satisfactory domestic powders.

Beryllium.—The master alloy with copper, containing 4% Be, in form in which the metal is most used, was in 1940 quoted at \$5 per pound of contained Be, and was available in the form of strip, wire and tubing, as well as in ingots. A new development in the use of beryllium was in the setting of diamonds in the bits and reaming shells.

Chromium.—The U.S. bureau of mines reported on experimental work done on the smelting of domestic chrome ores in the electric furnace, and on the possibility of using domestic ores in the production of chromium salts.

Copper.—During the year 1940 there appeared on the market a new type of commercial high purity copper. Bar, rod, strip and other commercial shapes of high density and exceptional ductility and malleability were produced by methods similar to those of powder metallurgy, by the heating and compression of broken electrolytic cathode sheets, followed by extrusion in the desired section. (See also COPPER.)

Magnesium.—A plant was being erected at Freeport, Tex., for the production of 6,000 tons of magnesium annually from sea water in which the metal is present only to the extent of 0.1%.

Manganese.—The expansion of the electrolytic process for the recovery of pure manganese from low grade ores from the pilot plant stage to commercial operation met with many difficulties, and was proceeding more slowly than had been anticipated. During the year ending July 1940 the plant capacity was raised tenfold, to about one ton daily, and to raise this to 50–100 tons daily will probably take another year or two. For discussion of the utilization of the product, see above, under *Alloys*.

Tin.—Plans were under way to erect a tin smelter and refinery in the United States as a part of the defence program. Work on this line had already been started on a small scale in 1939 by two commercial plants. The Metals Reserve company, an agency of the Reconstruction Finance corporation, closed a five-year contract with Bolivian producers, covering the purchase of concentrates containing 18,000 tons of tin annually, to cover the ore supply for a plant to be erected as a defence project, and operated under lease by one of the established smelting companies. (G. A. Ro.)

Metal Prices and Production: see MINERAL AND METAL PRICES AND PRODUCTION.

Metaxas, John (1871–1941), Greek statesman, was born on the island of Ithaca. In his youth he studied military tactics in Germany, then returned to his country to serve in the Turkish war of 1897 and the Balkan wars of 1912–13. After the World War of 1914–18 he was elected leader of the Free Opinion party and became minister of communications in 1926. In 1935 Metaxas was again in the cabinet as minister of state. The following year he became prime minister. On Aug. 4, 1936, after King George had suspended the constitution, Metaxas assumed dictatorial powers. On July 30, 1938, the government made him “prime minister for life.” When Italy

issued its ultimatum to Greece on the morning of Oct. 28, 1940, Metaxas speedily rejected the fascist demands and ordered his countrymen to fight. This they did with such notable success that the military capabilities of Metaxas and his army chief, Gen. Papagos, became almost proverbial. But in the midst of their military triumphs Metaxas was stricken with a fatal illness and died at Athens Jan. 29, 1941.

Meteorology. The weather of the year 1940 in the United States was characterized by moderately subnormal temperatures over the eastern half of the country and abnormal warmth over the western half, with more than the usual amount of precipitation and cloudiness. One month, January, had outstandingly subnormal temperatures in the east and the summer was much warmer than usual in the midwest and far west, but otherwise moderate temperatures prevailed. January was the coldest month of record in the south with very heavy frost damage in Florida, and considerable damage in other southeastern states. Florida had the most severe freeze in 25 years, resulting in a nearly total loss of growing truck crops amounting to more than \$20,000,000. The month brought heavy snow to the central states, with substantial falls in parts of the deep south, reaching eight inches in northern Louisiana. Following the January cold, the remainder of the winter had mild temperatures.

Spring was relatively cold in the eastern half of the United States and abnormally warm in the west. Mostly heavy precipitation occurred and generous rains in the winter wheat belt resulted in a remarkable recovery of the wheat crop from the extremely poor condition of the preceding autumn.

The summer had mostly moderate temperatures in the east, but they were outstandingly high in the western states where some areas had one of the warmest summers of record. Moisture conditions were mostly favourable for crop growth. However, mid-autumn brought a severe and abnormally early freeze to the southeastern states and tender truck crops were extensively damaged everywhere north of the Florida Everglades. In contrast to the preceding autumn, precipitation was heavy, which made conditions unusually favourable for seeding, germination and growth of winter grains. Wheat entered the winter in better than normal condition.

For the year as a whole, the temperature averaged below normal rather generally in the eastern states and decidedly above normal over the western half of the country, the greatest plus departures from normal appearing in the northwest, the western slope of the Rocky mountains and the Great Basin, where the annual average was as much as 4° above normal. The highest temperature reported for the year was 124° at Greenland ranch (Death valley), Calif., on Aug. 11, and the lowest 47° below zero at Fraser, Colo., on Jan. 19.

Precipitation.—Louisiana, with 74.6 inches of rainfall, or 134% of normal, was the wettest state in 1940; the second wettest, Mississippi, had 60.6 inches, or 114% of normal. The driest state was Nevada with an average of 10.9 inches, but this was 24% above normal; the second driest, Wyoming, 14.4 inches, slightly above normal. As related to the normal, California, with 156%, was the wettest state in 1940; and Nebraska, 74%, the driest.

California had the wettest year since 1909 and the third wettest of record; Nevada had the second wettest since 1913; Arizona the wettest since 1931; Utah the second wettest since 1927, and Idaho the wettest since 1927 and the third wettest of record. On the other hand, Nebraska had the fifth driest year in nearly half a century, while Illinois was the driest since 1930 and the fourth driest in 50 years. For the country as a whole the average precipitation for the year was 30.3 inches, exactly the

same as that for 1937, but not exceeded since 1927. The normal precipitation for the United States is 29 inches.

There was less than the usual amount of sunshine, the deficiencies being unusually large in the Gulf states, the far south-west and much of the Lake region, where some localities had from 200 to 400 fewer than the normal number of hours of sunshine. In relatively small areas, including the southern Ohio valley, the extreme northeast, the lower Great Plains and some northwestern sections there was more sunshine than occurs in a normal year.

Miscellaneous.—While fewer than the average number of tornadoes were reported, there were two outstandingly destructive storms: The first occurred at Albany, Ga., on Feb. 10, killing 17 people and causing property damage of about \$10,000,000; the second at Shreveport, La., one month later, resulting in 13

deaths. As usual, there were many destructive hailstorms. July 8 hail in several Iowa counties destroyed crops to the value of nearly \$500,000 and on July 13 about the same amount of loss occurred in Montana.

A tropical hurricane visited southern Louisiana on Aug. 6, causing property loss of nearly \$6,000,000. Some stations reported more than 35 inches of rain in four days, causing destructive floods which drowned some 25,000 cattle, 2,000 horses and mules and 20,000 hogs. About the middle of August damaging floods occurred in Virginia and on Sept. 1 southern New Jersey suffered flood losses of nearly \$1,000,000. (F. W. R.R.)

Other Countries.—The values for monthly rainfall and monthly mean temperatures given in the accompanying tables referring to countries outside the United States are provisional and may in some cases require a small correction.

On account of war conditions it has not been possible to give complete data for some of the stations. Gaps in the tables indicate that the data could not be obtained.

General Notes on the Weather of 1940.—The early months of the year were extremely cold over central and western Europe. The freezing of the Baltic sea, which had commenced in Dec. 1939, became progressively more severe, and ice seriously impeded navigation up to the end of the third week in January. Heavy ice was also prevalent in the rivers Scheldt and Maas during the first half of January. All navigation on the river Danube was stopped by ice on Jan. 18 and only on Jan. 18 were ice breakers able to resume work. The Black sea was frozen at Odessa. The week end beginning Friday, Jan. 26, brought heavy ice storms and a record snowstorm in the British Isles. The damage to trees, telegraph wires and telegraph poles was great and widespread.

A rather unusual phenomenon, a sudden heavy fall of hard clear ice-crystals, with no accompanying precipitation in any other form, was observed at a number of places in northern England. The crystals were in some cases as much as 4 millimetres in length, with a hexagonal base and clearly defined edges.

The summer was warm and dry over a large part of central and western Europe, August being the driest August for over a century. Severe drought persisted almost throughout Australia for many months, re-

Methodist Church.

he Methodist Church, as
stituted by the plan of
on which was adopted by the
ing conference in 1939, de-
ed most of the year to com-
ing the details of the new
mization and appointing its
ial personnel. The first gen-
conference, meeting in
ntic City, N.J., April 24-
y 4, 1940, fixed the head-
arters of the several Benev-
t boards as follows:

sions and church extension, New York, N.Y.; education, Nash-
e, Tenn.; temperance, Washington, D.C.; lay activities,
icago, Ill.; pensions, Chicago, Ill.; hospitals and homes,
Columbus, O.

uring the summer the six jurisdictional conferences into
ch the church in the United States is divided held their sev-
initial sessions. The western jurisdiction elected an additional
op to complete its quota, the Rev. Bruce R. Baxter; and the
ral jurisdiction (Negro) chose two bishops, the Rev. Lorenzo
King and the Rev. W. A. C. Hughes. Bishop Hughes died a
weeks later. In July the Administrative boards, elected by the
eral conference on nomination of the bishops, met in Chicago
organization. The executives were elected as follows:

oard of publication (formerly known as Book committee): chairman,
iam H. Swiggart, Jr.; vice-chairman, Troy W. Appleby.
oard of missions and church extension: president, Bishop Arthur J.
re; vice-presidents: Bishop F. J. McConnell, Bishop A. Frank Smith,
J. D. Bragg, John W. Hawley. Division of foreign missions: executive
tary, Ralph E. Diffendorfer; Division of home missions and church
asion: executive secretaries: E. D. Kohlstedt, Thomas D. Ellis, Fred
Mueller. Woman's division of Christian service: executive secretaries,
ign department: Sallie Lou McKinnon, Elizabeth M. Lee, Mrs. Otis
re, Mrs. Velma H. Maynor. Home department: Muriel Day, Mary L.
well, Mrs. J. W. Downs, Grace G. Steiner. Social relations: Thelma
ens. Joint division of education and cultivation: Willard G. Cram.
oard of education: president, Bishop Adna Wright Leonard; executive
taries: Harry W. McPherson, W. A. Alexander (since deceased), John
chisler, N. F. Forsyth, Lucius H. Bugbee, C. A. Bowen.
oard of hospitals and homes: executive secretary, N. E. Davis.
oard of Pensions: Bishop J. Ralph McGee; executive secretaries:
mas A. Stafford, Charles W. Tadlock.
oard of temperance: president, Bishop H. Lester Smith; executive sec-
ry, Ernest H. Cherrington.
oard of lay activities: president, Edgar T. Welch; executive secretaries:
rge L. Morelock, E. Dow Bancroft.
n pursuance of general conference action establishing a single
ominational weekly called the *Christian Advocate*, the Board
Publication elected Rev. Roy L. Smith editor and fixed the
ce of publication at Chicago. The *Epworth Herald* was discon-
ted, as were the several regional editions of the *Christian Advo-*

cate. Nolan B. Harmon was chosen as book editor with John W. Langdale associate and editor of *Religion in Life*. Editors of Church school literature are Lucius H. Bugbee and C. A. Bowen. Robert N. Brooks is editor of the *Christian Advocate* for the central jurisdiction. Elmer T. Clark edits *World Outlook*; Grover C. Emmons the *Upper Room* and Bettie S. Brittingham the *Methodist Woman*.

The Discipline of 1940 distributes the Methodists of the United States among the six jurisdictions as follows: Northeastern juris-
diction, 1,627,682; southeastern jurisdiction, 2,040,677; central,
329,325; north central, 1,706,326; south central, 1,409,351; west-
ern, 374,898. The residences of the effective bishops were fixed
by the jurisdictions as follows:

Northeastern: Boston, Mass., G. Bromley Oxnam; New York, N.Y., F. J. McConnell; Syracuse, N.Y., Charles W. Flint; Philadelphia, Pa., Ernest G. Richardson; Washington, D.C., Adna W. Leonard; Pittsburgh, Pa., James H. Straughn.

Southeastern: Richmond, Va., Wm. W. Peele; Charlotte, N.C., Clare Purcell; Columbia, S.C., William W. Watkins; Atlanta, Ga., Arthur J. Moore; Birmingham, Ala., J. Lloyd Decell; Jackson, Miss., Hoyt M. Dobbs; Louisville, Ky., U. V. W. Darlington; Nashville, Tenn., Paul B. Kern.

Central: Atlantic coast area, L. H. King; Columbus, O., Robert E. Jones; Baltimore, Md., Alexander P. Shaw.

North Central: Cincinnati, O., H. Lester Smith; Indianapolis, Ind., Titus Lowe; Detroit, Mich., Raymond J. Wade; Chicago, Ill., Ernest L. Waldorf; St. Paul, Minn., Ralph S. Cushman; Des Moines, Ia., J. Ralph Magee.

South Central: St. Louis, Mo., John C. Broomfield; Omaha, Neb., William C. Martin; Oklahoma City, Okla., Charles C. Selecman; Houston, Tex., A. Frank Smith; Dallas, Tex., Ivan Lee Holt.

Western: Portland, Ore., Bruce R. Baxter; Los Angeles, Calif., James C. Baker; Denver, Colo., W. E. Hammaker.

Retired bishops residing in the United States are:

W. N. Ainsworth, Macon, Ga.; William F. Anderson, Winter Park, Fla.; Edgar Blake, Coral Gables, Fla.; Hiram A. Boaz, Dallas, Tex.; Warren A. Candler, Atlanta, Ga.; James Cannon, Jr., Richmond, Va.; Matthew W. Clair, Covington, Ky.; Horace M. DuBose, Nashville, Tenn.; Sam R. Hay, Houston, Tex.; Edwin H. Hughes, Washington, D.C.; Frederick T. Keeney, Miami, Fla.; Frederick D. Leete, DeLand, Fla.; Charles L. Mead, Kansas City, Mo.; George A. Miller, San Jose, Calif.; Charles B. Mitchell, Pasadena, Calif.; John M. Moore, Dallas, Tex.; Thomas Nicholson, Mt. Vernon, Ia.; John L. Nuelsen, New York, N.Y.; Herbert Welch, New York, N.Y.

Bishop J. R. Chitambar of Jubbulpore, India, died Sept. 4, 1940.

Great Britain.—The annual conference session of the Methodist Church in Sheffield, July 16–20, 1940 was one of the shortest on record, owing to war conditions. Though 88 young men qualified for admission, none was accepted, because of government regulations regarding exemptions from military service. It was reported that 100 ministers were serving as chaplains with the forces. Because of the forced evacuation of Channel coast populations more than 50 churches in that region gave notice that they could not support a pastor this year. A War Emergency fund of £50,000 was authorized to care for refugees and preachers left without appointment. The presence of a pacifist group created some tension.

The year's statistics showed declines. Church membership was 787,835, a loss of 10,336; Sunday school enrolment was off 50,000, and Guild membership 60,000. Receipts for Home missions dropped £3,000 and for Foreign missions £13,000. The Oecumenical Methodist conference scheduled for Oxford in 1941 was indefinitely postponed. Two theological colleges were closed—Didsbury and Handsworth. The Publishing House had a deficit of £6,289, with sales down by £10,000. There was "a catastrophic shortage of paper." Conference officers for 1940 were: president, the Rev. Henry Bett; vice-president, William E. Clegg; for 1941: president, the Rev. William H. Armstrong, vice-president, Lord Rochester. The Rev. Edwin French continued as secretary. Even in the face of the ruthless bombings of the metropolis, the conference voted to meet in London in 1941. Chapel debts in the aggregate of £103,762 were paid in 1939, leaving £1,400,777 unpaid. Thirty-six new chapels were completed at a cost of £173,993. Debt-free chapel properties numbered 11,439.

(J. R. J.)

Metropolitan Museum of Art: see ART EXHIBITIONS; ART GALLERIES AND ART MUSEUMS.

Mexico, a federal republic, between the United States and Central America and bordering the Pacific and Atlantic (Gulf of Mexico); language, Spanish; capital, Mexico City; president, Manuel Ávila Camacho; area, 767,168 sq.mi. Population, 1940 census (provisional report): 19,446,065. The main cities are: Mexico City, 1,451,616; Guadalajara, 220,049; Monterrey, 180,942; Puebla, 137,324; Mérida, 98,334; León, 86,089; Tampico, 81,334; Aguascalientes, 81,124; San Luis Potosí, 78,042; Torreón, 76,613; Veracruz, 74,541; Chihuahua, 57,456; Pachuca, 52,387. In 1930 about 55% of the population was mixed, 29% Indian, 15% white. Foreigners constituted less than 1%. Around 14% spoke only Indian tongues.

History.—Mexico includes 28 states, each with its own governor and legislature and a limited autonomy, and three territories and a federal district, with governors appointed by the president. The national government is administered by a president elected for six years, and a bicameral congress. The 170 members of the chamber of deputies are elected for three years and the 58 of the senate for six years, by universal suffrage.

In 1940 Mexico was dominated by the hotly contested presidential election, which threatened for a time to provoke a large-scale revolt. Economic stringency and business stagnation attended the political uncertainty, which also slowed up the government's drastic social reforms. Vigorous activity in connection with national defence was unhampered, however, and war conditions in Europe forged stronger economic and diplomatic bonds between Mexico and the other American republics. The year ended with the new administration firmly entrenched and the nation optimistic.

The election of the republic's new president, General Manuel Ávila Camacho (*q.v.*), retired minister of national defence, a candidate of the official Mexican Revolutionary party, was fraught with violence and unrest. Reassured by incumbent President Lázaro Cárdenas that the election would be a free expression of public opinion, the leading opposition candidate, General Juan Andreu Almazán, conducted a vigorous campaign, and the storm balloting on July 7 ended with both parties claiming victory, a huge margin. Distrustful of the administration, Almazán's party made a separate tabulation of votes, asserted it had won the presidency and a majority in congress, and prepared to take office. Almazán himself retired to the United States while socialist demonstrations and uprisings by his followers in Mexico made it appear that the election would be disputed by armed force. When two rival congresses met in September, some thought was given to prolonging President Cárdenas's term or selecting a compromise chief executive to avert revolution, but the tense situation gradually subsided as a series of events discouraged the opposition party. On Sept. 1 Cárdenas recognized the official party's congress, which then declared Ávila Camacho president-elect by virtue of 2,476,641 votes to 151,101 for Almazán and 9,840 for Rafael Sánchez Tapia, former minister of national economy. (The opposition claimed 2,265,199 of the total vote for Almazán.) A week later Ávila Camacho won over to his side a large number of Almazán's followers by endorsing much of the program. Meanwhile, government troops gradually localized and quelled small armed rebellions in the north and riots in the federal district, where Almazán's staunchest support lay. After official recognition was accorded Ávila Camacho by the United States, Almazán renounced all claims to the presidency Nov. 6. Ávila Camacho was inaugurated on Dec. 1.

As 48 were killed and about 400 injured in election day rioting, neutral observers agreed that violence and fraud at the poll marred the voting and possibly even determined its results. Significant, however, was the fact that approximately 2,500,000 voted, more than twice the number in the 1934 presidential election. This did not include the female vote, which was excluded because the constitutional amendment permitting it lacked the necessary approval of two-thirds of the states. Both before and after the election, the press took full advantage of its freedom, and the resultant expression of public opinion, divided as it was, apparently tempered the policies of the victorious official party. Heretofore relentless in pursuing its revolutionary program, the administration party, and especially the new president, espoused doctrines as much in keeping with the opposition's moderate program as with its own socialistic six-year plan.

Without disinherit the revolutionary program, Pres. Ávila Camacho announced at his inauguration a new epoch of material as well as spiritual consolidation of the social achievements of Mexico, he said, must now develop her natural resources by extending credit and protecting capital, but without sacrificing labour and agrarian gains. The protection of small landholders, another oppositionist plank, was also announced. The new cabinet, apparently a stop-gap ministry, included both moderates and liberals. Ávila Camacho's first official act was the signing of an amnesty decree for all who had committed political crimes during the campaign. A Roman Catholic, the new president was endorsed by Archbishop Martínez. Ávila Camacho asserted that communists (sometimes associated with the Cárdenas regime) would have no place in his government. Like almost all Mexican presidents, Ávila Camacho is essentially a military man, but he is noted more for winning victory by conciliation than by battle.

Reacting to European war developments, Mexico hastily launched a program of national defence. In the summer, immigration, aliens within the country and unlicensed radio stations were

ely scrutinized. A virtual ban on nazi propaganda in the Mexican press was issued by the minister of interior, and Arthur Trutch, press attaché of the German legation, was expelled on charges of propaganda activities. In June the reaction was heightened by the change of front by Vicente Lombardo Toledano, leader of the powerful Confederation of Mexican Workers, who only denounced German aggression. On Aug. 20 the assassination of Lev Trotsky, famed Russian revolutionary, in Mexico City an alleged soviet agent brought the Communist party under sharp criticism from President Cárdenas. In August congress ended a compulsory military training law for men between the ages of 18 and 45, effective Jan. 1, 1941. Tentative plans were formed in November for a \$600,000,000 expenditure on naval bases and modifications and the purchase of seaplanes, torpedo boats, and submarines. (See HISPANIC AMERICA AND THE EUROPEAN WAR.) Economically, Mexico passed through another critical year. Business was retarded because of political uncertainty. High prices, credit restrictions, labour strikes and limited markets for raw material sources, due to war conditions abroad, intensified the depression. Some new capital entered the country, but much of this and most of the domestic funds were invested in real estate and homes instead of in commercial enterprises. The peso rose in value from a low of 17.35 cents U.S. to 20.75 cents, but the domestic economy was relatively unaffected. Mexico's vital oil industry, nationalized in 1938 and operated by the petroleum workers' union, experienced another hectic year. Production was up about 1%, but exports fell from 19,220,000 bbl. in 1939 to about 14,000,000 bbl. in 1940. Elimination of markets in Italy when that country entered the European war in June was partly offset by important sales to Japan and several United States firms in May, including a complete settlement with Sinclair Oil Co. for properties expropriated in 1938. In August two experts appointed by the Mexican courts evaluated the other expropriated foreign properties and submitted the figures of 172,727,000 pesos (\$34,546,000) and 181,292,000 pesos (\$36,258,000) as a basis for compensation. The companies themselves, however, refused to countenance either sum, and further settlement was left to the new administration of Mexico. Meanwhile, with a 68,000,000-peso deficit accumulated during two years of government ownership, the Mexican oil industry faced demands by President Cárdenas for drastic economies. The petroleum workers fought the reorganization plan until Dec. 11, when it was agreed that a joint commission of labour and management would effect such measures as the dismissal of all employees hired since the date of expropriation and certain reductions in salaries and staff personnel. Similarly, the union-operated railways of Mexico, also nationalized in 1938, came under sharp criticism. In a memorandum charging lack of discipline, excessive emoluments, deficient repairs, and lack of replacements, the minister of communications requested the new president to remove the industry from the management of labour and place it under government control. Pres. Ávila Camacho drafted a bill, proposing that the railroads be administered by a committee of four representatives of the government and three of the union, and be run by a general manager appointed by the chief executive. Immediately the railroad labour union appealed to its 36 units to fight the bill, but it passed congress on Dec. 27.

The mining industry, backbone of the republic's economy, continued to suffer from the European war, which, instead of lifting markets and prices, actually lowered them. Internal difficulties such as strikes and high freight rates further hampered the industry. Silver, most important mineral, continued to be quoted at 35 cents on the New York market, and practically all the exports went to the United States, but much was merely held there for future sales.

MASS MEETING of the followers of Gen. Manuel Ávila Camacho in Sonora shortly before his election to the presidency of Mexico July 7, 1940

Approximately 100,000 tons of lead and 50,000 tons of unsold zinc had accumulated within the country as a result of war conditions.

Mexico's social revolution slackened somewhat in the face of political unrest and economic stringency, but certain reforms continued unabated. Government-supported agrarian and labour movements were less in evidence than during the preceding year. In September, President Cárdenas announced that, during the six years of his administration, the government had redistributed a total of 45,349,000 acres of land to more than 1,020,594 peasants on 10,651 new communal farms. This, along with previous land division, had practically transformed Mexico's agrarian system from large feudal holdings with peon labour to co-operative community farms (*ejidos*) and small privately owned lands. A new policy was adopted on Dec. 11, when Pres. Ávila Camacho decreed that individual land titles would be given as soon as possible to the 1,500,000 peasants living on the nation's 15,000 communal farms. Under the decree the 65,000,000 acres were to be parcelled among the peasants, but communal operation, if not communal ownership, was to continue. Owners of small properties were secured in their possessions by a presidential measure of Dec. 21.

During the Cárdenas administration 57 irrigation projects were undertaken to reclaim extensive arid lands, including the three great dams of Río Yaqui-Angostura in Sonora, in 1940 practically complete, the Palmito in Durango, and Río San Juan-El Azúcar in Tamaulipas, both more than half finished. In the summer Mexico

City's prolonged water shortage was relieved by the installation of a pumping station providing over 100,000,000 quarts of water daily.

Education in the last 12 months of the six-year plan ended with some notable results. The rapid extension of rural education into the remote Indian villages had resulted in an increase by 400,000 in the enrolment of primary schools and a reduction in illiteracy from 50% to 45%. An experiment to teach adult Indians to read and write their own languages by reducing them to simple alphabets for instruction was expected to affect the 3,000,000 Indians who speak their native tongues in preference to Spanish.

A haven for European refugees, Mexico threw open her doors to the 80,000 to 200,000 Spanish republicans in France, but, as transportation facilities were lacking, relatively few arrived. Several hundred already in the country were granted naturalization papers, and 500 newly arrived were distributed in the rural areas in July. Persecuted intellectuals from all over Europe petitioned for passports, but in August Mexico moved to bar all but Spaniards. In September 100 Jewish refugees from Germany and other parts were denied admission, but in the following month passports were granted to 40 anti-fascist Italian intellectuals.

The Roman Catholic church continued to operate in Mexico with full religious freedom. Officially, the number of priests was limited to 350, about one for each 45,000 inhabitants, and the church is prohibited from holding real estate, but the enforcement of other anti-church measures was relaxed.

Foreign Relations.—Maintaining neutrality in the European war and membership in the League of Nations, Mexico nevertheless announced a pro-Ally government policy in June. Relations with Great Britain, broken off in 1938 during the oil expropriation controversy, remained severed, but unofficial negotiations for their resumption were carried out during 1940. Agreement was reached early in the year between Mexico and the governments of France, Germany and Italy for the free passage of several thousand Spanish civil war refugees in France who desired to emigrate to Mexico.

The first Inter-American Indian congress was held at Pátzcuaro, Mexico, in April, establishing a permanent Institute of Indian Affairs with its seat in Mexico. Information was exchanged resulting in a concrete program for the betterment of the 30,000,000 Indians in the Americas. In July at the Pan-American conference at Havana, Mexico became a signatory party to a pact which provided for the setting up of machinery to seize and administer jointly any European possessions in the western hemisphere which are threatened with transfer of sovereignty. During the summer, Major Antonio Cárdenas, ace Mexican flier, made a 14,000-mi. good-will flight to the United States and around Latin America.

Relations with the United States were strained early in the year. In January President Cárdenas denounced the Monroe Doctrine as a unilateral policy, but endorsed the several inter-American agreements to settle disputes and resist invasion collectively. In May the United States note demanding immediate reparations for or submission to arbitration of the oil expropriations was dismissed by Mexico with a reiteration of her stand that the controversy was purely a Mexican problem and therefore outside the realm of international relations. No further representations on the issue were made during the year. On Nov. 12, however, when the United States formally recognized Gen. Ávila Camacho as president-elect of Mexico and sent its own vice-president-elect, Henry A. Wallace, to the inauguration as official representative, relations between the two countries improved. Closer co-operation between the two in national defence

programs was foreseen. In December provision was made for the use of Mexican airports for stop-overs by United States army planes flying to and from the Canal Zone.

During the last two months of the year negotiations for the leasing by the United States of Mexican naval bases and the construction of new ones with United States funds were rumoured, but such plans were repeatedly denied in responsible quarters of both governments.

Education.—Public instruction is free and compulsory. Urban schools are supported largely by the states; rural schools by the government. There are over 20,000 schools of all kinds in the country. Illiteracy (50% in 1930) was reduced to 45% in 1940 as a result of promoting rural education, especially among the Indian population.

In 1940 there were 12,974 rural schools supported by the government, 2,406 by the states, and 1,189 by private organizations. There were 10 institutions of university rank, including the National Autonomous university and National Labor university, both at Mexico City. Public education accounted for the second largest national expense. The 1941 budget called for 77,000,000 pesos for that purpose (73,800,000 pesos in 1940).

Banking and Finance.—The monetary unit is the peso (value 20.75 cents U.S. on Dec. 31, 1940, with parity not determined 17.35 cents in 1939). The national gold reserve in 1940 amounted to \$31,000,000 U.S. (\$21,400,000 in 1938). The national budget in 1941, largest in Mexican history, called for approximately 492,000,000 pesos (448,769,000 in 1940). Mexico in 1940 did not share in the loans made to Hispanic American countries by the United States Export and Import bank.

Trade and Communications.—Foreign trade in 1939 totalled 1,544,098,107 pesos, a 15.9% increase over 1938. Germany succeeded Great Britain as second to the United States in Mexican commerce. In 1940, however, Germany practically dropped from the trading.

Exports in 1939 totalled 914,389,882 pesos (9.1% more than in 1938) with mineral products, chiefly silver, gold, lead, copper and petroleum constituting 69.9%. In the first half of 1940 exports rose in value to 520,100,000 pesos (490,300,000 pesos in the same part of 1939). The United States took 72.4% in 1939, Germany 7.1%.

Imports in 1939 came to 629,700,000 pesos (27.4% over 1938) with automobiles, rayon yarn, machinery and other manufactures the main commodities. In the first six months of 1940 imports rose to 353,100,000 pesos (306,100,000 pesos in the first half of 1939). The United States supplied 61.8% of the 1939 imports, Germany 16.3%.

Mexico's external communications are by steamship service, especially through Veracruz, by three main railways to the United States, and one to Guatemala; by increasingly important air service north and south and to the West Indies; and by highway, notably through Nuevo Laredo to the north.

Other highways are mainly from Mexico City west to Guadaluajara, southwest to Acapulco, east to Veracruz, and southwest toward Oaxaca. There were 24,363 km. of railway in 1939, over 50% of which was government owned. Mexican air service carried 85,481 passengers, 3,852 tons of freight, and 269,690 kg. of mail in 1939. There were 138,081 telephones with a lineage of 63,407 km. in 1938 and 41,169 km. of telegraph lines. Licensed radio stations number 103.

Agriculture and Mining.—Mexico's chief resource is mining. There are some 31,000 mining properties, about 97% of which are owned by foreigners, and almost all of which yield silver. For four centuries Mexico has produced 40% or more of the world's silver (2,359,826 kg. in 1939). In the first eight months of 1940 production was up 17.1%. Other important minerals include

ld (26,178 kg. in 1939), copper (44,300 metric tons), lead (19,500 metric tons) and zinc (134,100 metric tons), and such strategically important minerals as antimony, mercury, arsenic, amorphous graphite and molybdenum. Coal is produced in Coahuila state (1,000,000 tons annually), and opals are found in the state of Querétaro. Holding sixth place in world petroleum production, Mexico's 1940 production was estimated at 43,470,000 l. (42,897,500 bbl. in 1939).

The extent of agricultural land in Mexico is estimated at 275,000,000 ac., much of which was in 1940 inadequately developed. Leading crops with their 1938 production (in metric tons) were: maize (1,692,660), cotton (66,335), wheat (324,927), sugar cane (132,260), bananas (546,936), henequen (sisal-hemp) (133,000), coffee (41,331) and beans (105,499). Rice, barley, chickpeas and various fruits are also grown.

There were more than 30,000,000 head of livestock in Mexico including cattle, horses, mules, donkeys, sheep, goats and pigs. Manufactures include sugar and oil refining, textiles, tobacco products, iron and steel, rubber, leather, glass, flour and meat packing. Fishing is important on the west coast. An important source was the tourist trade, mostly from the United States. Visitors from that country in 1939 spent \$53,000,000 in Mexico, but \$1,000,000 more than in 1938. In the first nine months of 1940, 48,854 tourists entered Mexico (46,634 in the same period of 1939).

Army and Navy.—Mexico's largest appropriations were for national defence (110,000,000 pesos in 1941; 94,025,000 pesos in 1940). The standing army was unofficially estimated at 56,000, with 150,000 in reserve. Compulsory military training for men from 18 to 45 years of age, effective Jan. 1, 1941 expected to draft 100,000 annually until a reserve of 200,000 is reached. The air force had 90 planes and 700 men and was being steadily increased. The navy had no battleships, cruisers, destroyers, or submarines, but had six escort vessels, ten coast guard boats and three patrol vessels. (See also INTERNATIONAL LAW; PETROLEUM; UNITED STATES.)

ca. In the discussion of mica one is mainly concerned with sheet mica; although there are many commercial uses for ap mica, this is a low grade material that falls into a different category from that of sheet mica. Sheet mica is classified according to the standard size of sheet that can be trimmed to type, and that below the smallest size, but still too large for ap, goes to splittings, for the production of built-up mica tapes, using a plastic binder. The growing demand for built-up mica has made splittings a feature of the market, with a consumption in the United States about double that of sheet mica.

The normal world total output of about 50,000 metric tons, of which 10,000–12,000 tons is sheet, and the remainder scrap, declined rather sharply in 1938 in practically all countries. The output of British India stands foremost, with mainly sheet and splittings, but in recent years considerable amounts of scrap have apparently been included, so that the data available have little meaning. Other British empire producers include Canada, Rhodesia, South Africa, Tanganyika and Australia, but none of these is of any great commercial importance except Canada, and here output has declined heavily in the past decade.

The United States output of 470 short tons of sheet in 1938 declined to 407 tons in 1939 but scrap rose from 20,300 tons in

1938 to 24,700 tons in 1939. Imports dropped by about half in 1938, to 4,530 tons of scrap and ground mica, 175 tons of sheet and 890 tons of splittings, but increased slightly in 1939 and 1940.

Heretofore mica has lacked any satisfactory substitute for its most important uses, but the discovery of an artificial film made from bentonite gives promise of serving for many of the ordinary electrical uses of mica, but due to a high power factor it had not been developed to a point where it could be used in high grade condensers.

(G. A. Ro.)

Michael, King of Rumania: see MIHAI (MICHAEL).

Michelin, Edouard

(1859–1940), French manufacturer. He established with his brother, André, the Michelin Tire company, which was the first to use pneumatic tires on motor vehicles. They started with the manufacture of bicycle tires but with the perfection of the motor car they made tires for the new vehicle and long held a leading place in the business, with factories in the United States as well as in France. He died at his home in Orcines, France, Aug. 25.

Michigan

one of the north central group of states, was the 26th state to become a member of the United States. It is popularly known as the "Wolverine state"; area, 97,940 sq.mi.; population (U.S. census, 1940) 5,256,106; (estimate Jan. 1, 1941) 5,285,000. Capital, Lansing, 78,753. Larger cities were Detroit, 1,623,452; Grand Rapids, 164,292; Flint, 151,543; Saginaw, 82,794. Of the state's population, 3,454,867 were urban, or 65.7%. According to the U.S. census, 1930, whites comprised 96.03% of the population, Negroes 3.97%; of the whites, 81.93% were native born, 18.07% foreign born. According to the 1940 registration, there were 290,730 aliens in Michigan, or 6.1% of the total in the continental United States. About 350,000 of Michigan's population lived in the upper peninsula which comprises approximately one-fourth of the state's land area and possesses nearly one-half of the state's 1,624-mi. shore line (longest freshwater shore line of any state in the union).

MURRAY D. VAN WAGONER, a Democrat, was elected governor of Michigan Nov. 5, 1940

Although the rate of increase in population, 8.5%, was the lowest in the state's history, it nevertheless exceeded the 7.2% of increase of the country as a whole. Michigan was one of eight states which, on the basis of existing apportionment laws, would be entitled to additional representation in the United States house of representatives—the only northern state lying east of the Rocky mountains to make such a gain. The state's population increase was greater on the rural than on the urban side. Detroit, which in the first three decades of the century experienced population increases of 97%, 113% and 58%, respectively, grew only 3.5% between 1930 and 1940. Territorially, according to official figures, Michigan in 1940 expanded by nearly 70%, accordingly jumping from 22nd to 8th place among the states. This seemingly astounding feat was explained by the fact that the U.S. bureau of the census, thanks largely to the persistent efforts of former

Governor (1911-12) Chase S. Osborn, decided, in listing the area of the state, to include the 39,960 sq.mi. of Great Lakes' water surface lying within her borders.

History.—There was no session of the legislature in 1940. Politics, however, were lively throughout the year. In March the department of corrections removed Marvin L. Coon, Democrat, warden of Marquette prison, and appointed Simon R. Anderson, Republican, to succeed him. Upon the death of Judge William W. Potter, of the state supreme court, in July, Governor Dickinson appointed Emerson Richard Boyles, legal adviser to the governor, to fill the vacancy until Jan. 1. Following a long quarrel between the Crippled Children's commission and the governor, Hugh E. Vande-Walker, chairman of the commission, resigned in October after 14 years of service on the commission, submitting a 12-page letter of protest against the governor's policy. Governor Dickinson in July announced the creation of a Michigan National Defence council of 20 members with former Governor (1931-32) Wilber M. Brucker made state defence administrator.

In the September primary, 81-year-old Governor Dickinson, seeking return to the governorship, received a substantial plurality of votes in his race with seven other Republicans, though he failed to obtain a majority of the votes cast. On the Democratic side, Murray D. Van Wagoner, who had served as state highway commissioner since 1933, received the nomination. On the eve of the Republican state convention, late in September, nominee Dickinson made a spectacular move when he broke with Frank D. McKay, who had been chairman of the Michigan delegation at the Republican national convention and who was commonly regarded as one of the party "bosses." In the state convention's nominations, Dickinson was clearly dominant.

In the November election, Wendell L. Willkie, Republican nominee for the presidency received 1,039,917 votes and Roosevelt, Democratic nominee, 1,032,991 votes. Van Wagoner defeated Dickinson by 131,291 votes, marking the fifth instance in as many successive biennial elections where the governorship passed from one major party to the other. Other choices were: for lieutenant governor, Frank Murphy, Democrat; for secretary of state, Harry Kelly, Republican (re-elected); for attorney general, Herbert J. Rushton, Republican, defeating former incumbent (1937-38) Raymond W. Starr, Democrat, by a margin of 3,469 votes; for state treasurer, Theodore I. Fry, Democrat, regaining an office formerly held (1933-39), by the correspondingly narrow margin of 4,817; for auditor general, Vernon J. Brown, Republican (re-elected). In a nominally non-partisan race for supreme court justice, Emerson R. Boyles, Republican Governor Dickinson's appointee of a few months before, easily defeated Philip Elliott, endorsed by the Democratic convention. United States Senator Arthur H. Vandenberg, Republican, was re-elected. A lively demand for recounts of the votes for the offices of attorney general and state treasurer was intensified by the claim that in the city of Jackson voting machines had operated in such a way as to make it difficult to vote a straight Democratic ticket. However, no recounts were held. The election returned strong Republican majorities in both houses of the state legislature. Four referenda met varying fates in the election. A proposed constitutional amendment to liberalize the existing 15 mill limitation on assessments for school purposes failed of adoption by 240,000 votes; a civil service amendment providing for the inauguration of a broad merit system was adopted, 766,764 to 709,894; a proposal to subject to broader taxation Detroit motor bus service operating outside of the city limits failed by a margin of nearly 300,000 votes; a proposal for strict regulation of dental advertising won by a lead of over 200,000.

The post-election period was one of significant developments.

Declaring that he hoped the appointment would lead to friendly litigation which would clarify Michigan's laws of succession to the executive office, Governor Dickinson on Nov. 19 appointed Mrs. Matilda R. Wilson of Detroit as lieutenant governor. Attorney General Thomas Read, however, promptly asserted that the appointment was a nullity and that he would not recognize it when the end of the year arrived the test case anticipated by Dickinson had not materialized. On the eve of inauguration it became known that Governor Dickinson was submitting to the incoming Republican senate a list of 58 appointments to office. Despite statements that the names were submitted "for information only" and were merely to confirm interim appointments, Governor-elect Van Wagoner took this eleventh hour move sufficiently seriously to see that his hastily prepared rival list reached the senate at the same time as Dickinson's list. As the session of the legislature got under way, the Van Wagoner list appeared to be favoured for confirmation.

Education.—Vocational guidance and problems of rural education received special attention from the state department of public instruction, under the superintendency of Eugene B. Elliott. State financial aid to the extent of \$41,000,000 was granted to public schools by the legislature. October enrolment figures recorded 59,907 students in public and non-public colleges and universities in the state; enrolment for the summer session was 17,524.

Charities and Correction.—Considerable skepticism had been expressed concerning the wisdom of county "home rule" administration of relief when the system was inaugurated in Dec. 1939. However, the first biennial report of the Social Welfare commission was optimistic, though the commission did strongly recommend a study of the desirability of establishing a uniform organization of county boards of social welfare. Total sales of prison industries amounted to \$1,255,709. As of Sept. 30, 1940 of 7,611 prisoners 883 were serving life terms (Michigan does not have capital punishment), 6,954 were American born, 3,274 Michigan born.

Banking.—Frederick B. Elliott, Jr., state banking commissioner, announced at the close of the year that examination reports reflected that the state's 349 banks, 11 trust companies and seven industrial banks were in the best condition they had been in since several years prior to the bank holiday of 1933. Authorized disbursements of dividends to banks placed in liquidation amounted to \$6,274,200 in 1940.

Agriculture, Manufactures, Mineral Production.—Authorities estimated a slight decline in the value of Michigan crops from \$139,077,000 in 1939 to \$138,737,000 in 1940. Michigan continued its leadership among the states in the federal program of the elimination of Bang's disease in cattle. About \$1,000,000 worth of trees in the state forests and about the same amount of the federal-owned forests in the state were blown down in a severe windstorm on Nov. 11.

Preliminary reports indicated a rapid increase in the production of automobiles. At the close of the year, strikes were impending in several industries. The year witnessed a \$16,000,000 road-building program carried through, with 257 mi. built with the aid of federal funds. Congress passed a measure authorizing the construction of a bridge across the Straits of Mackinac.

Permits for oil and natural gas exploration totalled 1,113 in 1940. More than 35,000,000 bbl. of oil and nearly 20,000,000,000 cu.ft. of gas were produced.

BIBLIOGRAPHY.—Bulletin No. 307 of the Department of Public Instruction, entitled *Michigan Today*, Eugene B. Elliott, ed. (1938); *The Michigan History Magazine*, quarterly; printed reports of the various governmental offices; *Michigan Official Directory and Legislative Manual*, published by the secretary of state biennially. (L. G. V. V.)

Michigan, University of. On April 3, 1940, the new building of the W. K. Kellogg Foundation Institute of Graduate and Postgraduate Dentistry at University of Michigan was dedicated. It is believed to be the finest and most adequately equipped institution of its kind in the world. Postgraduate instruction for practitioners is given in courses requiring from one to three days a week throughout the semester, or in two-weeks' intensive courses; graduate instruction, leading to advanced degrees, is under the supervision of the graduate school.

The new residences for men and women students, constructed in 1938-39, and the "Michigan House plan," for their administration, had their first year of actual operation in 1939-40, with encouraging results.

A new student health service was opened in the spring of 1940, and preparations were made for the construction of a building in Detroit, the gift of the Horace H. Rackham and Mary A. Rackham fund, in which the university's extension work in that city is to be conducted. On the academic side, the introduction of a free program leading to honours in liberal arts was a notable feature of the year.

A course in aviation under the auspices of the Civil Aeronautics Administration was given during the year, and arrangements were made for the institution of a Naval R.O.T.C. in the fall of 1940. The university and its several faculties, in consultation with governmental authorities, also made preliminary plans to be of service in various ways in the national emergency. (A. G. R.)

Light Auto Racing: see AUTOMOBILE RACING.

Midway Islands, a group of two small islands and several sand islets in lat. 28° 13' N. and long. 155° 23' W., 1,149 miles N.W. of Honolulu, belonging to the United States of America. The larger is Sand island; about 850 acres, maximum height above sea level, 43 feet. The other is East island; about 328 ac. and very low.

The islands are enclosed in a circular reef about five miles in diameter, about four-fifths of which is above water. There are no native inhabitants.

The group was discovered in 1859, by Captain Brooks, bark "Ambler," who took possession in the name of the United States. Captain Reynolds, U.S.S. "Lackawanna," took possession formally Aug. 28, 1867.

By executive order, dated Jan. 20, 1903, the islands were placed under the control and jurisdiction of the U.S. navy department. Sand island is the site of a commercial cable station. The navy department has licensed Pan American airways to establish facilities for use in connection with its transpacific commercial airline. The 76th congress authorized the navy department to construct a seaplane base at Midway and appropriated approximately \$1,000,000 for the purpose. The work, involving dredging for a landing basin for tenders and oil tankers, ramps, barracks and administration buildings and public works to accommodate permanently one squadron of patrol planes and 300 men, was in progress (Jan. 1941). (L. S. F.)

Mihai (Michael) (1921-), king of Rumania after the forced abdication of his father, Carol II (d. 1940), was born at Sinaia on Oct. 25. He first became king in 1927 under a regency when his grandfather, King Ferdinand, died. Carol, the heir apparent, had renounced the right of succession because of his affection for Magda Lupescu; in 1930 he annulled this decision, however, and returned to Bucharest to be crowned. Mihai again became king Sept. 6, 1940 when Premier Antonescu persuaded his father to vacate the throne after a

disastrous summer in which Rumania had lost most of the territory ceded to her after the World War of 1914-18. Princess Helen, his mother and Carol's divorced wife, returned to Bucharest and even the Iron Guard joined in public prayers for success of the young king's reign. The first weeks of his reign were anything but auspicious. November brought an earthquake, a series of mass executions by the Iron Guard and the threat of civil war, not to mention the possibility of further territorial demands on the country by her neighbours.

Milch, Erhard (1892-), German soldier and chief of the *luftwaffe* under Goering. Born at Wilhelmshaven on March 30, he studied at Danzig Technical high school and Koenigsberg university. During the World War of 1914-18 he became an army pilot and was advanced to flight general. After the war he became a commercial pilot. He had long been a friend of Goering, and when the nazis came into power in 1933 Milch was made secretary of state in the air ministry. In this capacity he founded the Air Sport league and the Hitler Flying Youth. In 1935 he began the task of building Germany's embryonic air force into a veritable armada of fighting planes. Putting his faith in mass output, Milch confined production to only a few standardized models and was thus able to procure thousands of planes in less than five years. Promoted to colonel general in 1938, he was created field marshal by Adolf Hitler on July 19, 1940. He is also chairman of the Deutsche Lufthansa, Germany's national airline.

Military and Naval Forces: see ARMIES OF THE WORLD; AIR FORCES; NAVIES OF THE WORLD.

Milk. The 1940 milk flow reached new high levels in the United States under the stimulus of increased industrial activity and consumer buying power and owing to the greatly enlarged demand for evaporated, condensed and dried milk for export to Europe, particularly to the United Kingdom. While the European war greatly curtailed exports of most American agricultural products, processed milk apparently is one agricultural product that is proof against wartime disruption. Its production and export in the U.S. expanded greatly during the World War of 1914-18, as it did during the European conflict beginning in 1939. U.S. exports of evaporated milk in 1940 were the largest in 19 years, and

A "MILK REBELLION" in Pittsburgh in April 1940 followed enactment of a Pennsylvania law that all families on relief should purchase one pint of milk daily for each child under 16. Housewives protested by returning half-filled bottles to the county relief office

for the first ten months in 1940 were 108,279,340 lb. compared to 23,006,000 lb. in the same months in 1939. U.S. exports of condensed milk the first nine months of 1940 were 14,357,592 lb. compared with 1,638,533 lb. in the corresponding months in 1939. Exports of dry milk the first ten months of 1940 were 9,892,324 lb. compared with 7,239,699 lb. in the like period of 1939. Production of evaporated milk in the ten-month period was 2,191,326,000 lb. in 1940 and 1,907,148,000 lb. in 1939; condensed milk, 51,078,000 lb. in 1940 and 31,613,000 lb. in 1939. Stocks of evaporated milk in the U.S. Nov. 1, 1940, were 358,294,000 lb., the largest on record for that date and 40,511,000 lb. over the five-year (1934-38) average. Stocks of condensed milk Nov. 1, 1940 were 9,115,000 lb. compared with 6,312,000 lb. a year earlier. Stocks of dried milk Nov. 1, 1940: dried whole milk 5,357,024 lb. compared with 3,952,443 lb. in 1939; dried skim milk 40,693,522 lb. in 1940 and 8,388,280 lb. in 1939; dried buttermilk 6,878,454 lb. in 1940 and 1,188,740 lb. in 1939.

There was no marked change in consumption of fluid milk and cream in the U.S. in 1940, although slight increases were reported in a number of cities where improved retail methods, such as quantity distribution in two-quart and gallon containers and every-other-day deliveries, effected small price concessions. Fifty per cent of the retail price of milk is represented by handling charges after the milk leaves the producer. Paper milk containers were put in use in New York, Chicago and other cities in 1940, but there was a dispute between glass bottle and paper bottle manufacturers as to whether paper containers were cheaper than glass. Since 1930 increased consumption of fluid milk and cream has merely kept pace with the increase in population, but in that time milk used in manufactured dairy products has increased 16%, from 44,100,000,000 lb. in 1930 to 51,200,000,000 lb. in 1939. Exact figures are not available, but milk used in manufactured dairy products in 1940 exceeded the previous high, 51,400,000,000 lb. in 1938, owing to record production of butter, cheese and canned and dried milk. (See also BUTTER; CHEESE; DAIRYING.)

(S. O. R.)

Millis, Harry Alvin (1873-), U.S. economist and labour arbitrator, was born at Paoli, Ind. May 14. After receiving his bachelor's and master's degrees at Indiana university and his doctorate at the University of Chicago, he was appointed professor of economics and sociology at the University of Arkansas in 1902. The next year he joined the faculty of Stanford university, and from 1912 to 1916 he was chairman of the department of economics at the University of Kansas. In 1916 he went to the University of Chicago as professor of economics. Here, in 1919, he first became associated with the problems of labour disputes, as chairman of the board of arbitration for the men's clothing industry in Chicago. He became widely known for his tact and perseverance in effecting conciliations between employer and labourer. In 1934-35 he was a member of the National Labor Relations board, and President Roosevelt again appointed him to the board Nov. 15, 1940 to succeed J. Warren Madden, the former chairman. He was elected chairman and sworn in Nov. 27. At the time of his appointment Millis was permanent conciliator between the United Automobile Workers' union and General Motors corporation. He was president of the American Economic association in 1934 and is the author of *The Japanese Problem in the United States* (1915) and *Sickness and Insurance* (1926).

Mineral and Metal Prices and Production.

and London markets. In the United States, although some prices advanced, these were largely confined to imported goods, for which freight and insurance rates increased materially. The *Engineering and Mining Journal* index of nonferrous metal prices declined from 80.85 in Jan. 1940 to 77.19 in April, rose to 78.85 in June, declined again to 76.71 in August, advanced to 83.14 in November, and dropped to 82.42 in December; the average for the year was 79.22, against 77.71 in 1939 and 90.86 in 1937, the last year in which conditions were at all comparable. The open market prices for many of the more important commodities in the London market have been replaced by a controlled price, which sets the maximum beyond which the market may not go.

Table II gives such data as were by January 1, 1941, available on mineral and metal production in 1939 for the leading commodities and the more important producing countries. However, many of the figures are estimates, and others are lacking. The *Statistical Summary* of the Imperial Institute, from which this table is usually compiled, did not appear in 1939, and the data presented were accumulated from a number of sources, mainly *Mineral Industry*, *Minerals Yearbook*, *Yearbook of the American Bureau of Metal Statistics*, and the *Statistical Yearbook of the League of Nations*. The *Mineral Industry* index for the aggregate world mineral production rose in 1939 to a new high at 152, as compared with 139 in 1938 and the former high of 150 in 1937. The chief items contributing to the rise were petroleum, pig iron, copper, zinc, aluminium and tin. (G. A. Ro.)

Mineralogy. Because of the disturbed international conditions, the scientific activities of some European mineralogists were curtailed. During 1940 five new minerals were described: montgomeryite, bellingerite, sterrettite, pararammelsbergite and clinobarrandite (*American Mineralogist*, May, August, September, November). Spencer published the 15th list of new mineral names, with an index of authors (*Mineralogical Magazine*, September). The following meteorites were described: the Bartlett, Bell county, Tex., by Bullard; the Lubbock, Lubbock county, Tex., by Waldschmidt; the Shallowater, also Lubbock county, Tex., by Foshag (*American Mineralogist*, July, August, December); the Boxhole meteoritic iron, central Australia, by Madigan; the Tauq, 'Iraq, by Macfadyen and Claringbull (*Mineralogical Magazine*, March, September). Extensive studies were reported on ceramic clay in Hawaii by Wentworth, Wells and Allen (*American Mineralogist*, January); on the crystal chemistry of certain phosphates, arsenates and vanadates by Richmond (*ibid.*, July); on the classification of minerals of the type $A_3(XO_4)_2 \cdot nH_2O$ by Wolfe (*ibid.*, November, December); on the structure of orthoclase by Chao, Hargreaves and Taylor (*Mineralogical Magazine*, March); on colloidal gold as a colouring principle in minerals by Friend and Allchin (*ibid.*, September). New refractometers using the diamond and other minerals were described by Anderson, Payne and Pike (*ibid.*, September).

Gem Minerals.—Ball reviewed extensively the diamond industry and stressed the increased use of industrial diamonds (*Jewelers' Circular-Keystone*). Inclusions in gem-stones were discussed in detail by Bach (*Gemmologist*, London, January, February, March, April).

Roebling Medal.—At the annual meeting of the Mineralogical Society of America held at Austin, Tex., Dec. 26, the third Roebling medal of the society was awarded to the distinguished British mineralogist, Dr. Leonard J. Spencer of London, England. Dr. Spencer was long associated with the mineral department of the British museum and since 1900 he has been editor of the *Mineralogical Magazine*, issued by the Mineralogical Society of Great Britain. He is author of many books and scientific articles.

Necrology.—Four prominent mineralogists, all fellows of the

Mineralogical Society of America, died during 1940. Dr. W. Brøgger of Oslo, Norway, died Feb. 17, age 89. Dr. Brøgger was an authority on Norwegian rocks and minerals. He had served as professor of mineralogy and geology at both the University of Stockholm, Sweden, and at the University of Oslo. Since 1917 he was professor emeritus of the latter institution. Lazard Cahn was vice-president of the Mineralogical Society of America in 1934, died May 23, age 75. He was widely known as a collector of, and dealer in, minerals. In 1927 a new boro-arsenate of calcium named Cahnite in his honour. John Eliot Wolff, president of the Mineralogical Society of America in 1934, died Aug. 9, age 71. Professor Wolff was largely responsible for the development of the department of mineralogy and petrography of Harvard university where he served in various academic ranks from 1887 to 1923, when he became professor emeritus.

Philip Krieger, mineralogist and mining engineer and staff member of the department of geology, Columbia university, died Aug. 18, age 40.

Minnesota, a north central state of the United States, popularly known as the "Gopher State," has an area of 84,682 sq.mi., of which 3,824 are water. Population, U. S. census of 1940, 2,792,300, an increase of 228,347 since 1930. This increase of 8.9% compares with the 1920-30 increase of 7.4%. Capital, St. Paul, 287,736. The only city in the state with a larger population was Minneapolis, 492,370. Duluth has 101,065.

History.—The state division of employment and security reported an estimated \$40,000,000 increase in pay rolls throughout the state for 1939 over 1938. Increased confidence of Minnesota business resulted in 20,000 new jobs during the past two years, according to Governor Harold E. Stassen in his review of the labour program for 1940.

In the first 14 months, from April 1939 to June 1940, following the passage of the labour conciliation law, 39 strikes resulted from a total of 553 notices given, and wage losses from strikes in Minnesota were cut in half. Labour disputes affected a farm implement machinery company, a power company, metal product laundries, ice cream companies, a refrigerator company and numerous foundries in the state. The federal government intervened in settling the refrigerator strike so that work could proceed on national defence contracts. WPA spent an estimated \$44,637,981 in Minnesota in 1940, giving work to a monthly average of 39,671 persons. Joseph H. Ball was appointed to fill the vacancy in the senate caused by the death of Ernest Lundeen. Ernest L. Olson was appointed co-ordinator for the State Defense Industrial Commission. Governor Stassen was selected to give the keynote address at the Republican National convention held in June.

From Minnesota 328,987 men registered under the selective service law. The gross quota for the first year of conscription was 38,021, the net quota of 18,652 men to be furnished by June 30, 1941.

In the November presidential election Roosevelt (Dem.) secured 644,196 votes, Willkie (Rep.) 596,274; Thomas (Sci.) 5,454; Browder (Com.) 2,711; Aiken (Ind.) 2,553. Governor Harold E. Stassen was re-elected by a plurality of 200,000 votes. Senator Henrik Shipstead, who withdrew from the Farmer-Lab-

ty to join the Republican ranks, won a fourth term by a majority which approached 300,000. Republicans elected their entire ticket and eight of the nine congressmen. Elmer Ryan, who for re-election as congressman on the Democratic ticket, was elected after having carried the second Minnesota district three times. He opposed President Roosevelt on the third-term issue. The Farmer-Labor party ranked second in the voting on state issues, but the Democrats increased their strength to a marked degree. Conservatives had strong control of both houses of the state legislature as a result of the fall election. Officers of the state were: Governor, Harold E. Stassen; lieutenant governor, C. Elmer Anderson; secretary of state, Mike Holm; treasurer, Julius A. Schmahl; auditor, Stafford King; attorney general, J. A. A. Burnquist; chief justice, Henry M. Gallagher.

Education.—Minnesota school enrolment for 1939-40 was 1,571 pupils, 22,177 teachers; total public school expenditure increased from \$52,004,084 to \$52,287,794. The University of Minnesota had a regular enrolment of 15,871 students in 1940, a grand total of 26,383 students, including all branches and divisions. It ranked second in the United States in enrolment. Minnesota's educational system numbered 10 colleges in addition to the state university, 654 high schools, and six state teachers' colleges.

Charities and Correction.—The department of social security had general control in 1940 over 19 state institutions and supervision of 14 county tuberculosis sanatoria. About 62,850 pensioners received a total of \$1,321,085 in old-age assistance, or an average of \$21.02 per person. About 3% of the recipients of old-age assistance relinquished it because of the homestead lien provision which became effective Jan. 1, 1940. As a result the state cost was reduced about \$10,000 a month.

Banking and Finance.—On June 30, 1940 there were 484 state banks with deposits of \$285,896,644 and 188 national banks with deposits of \$750,180,000 and resources of \$833,476,000. The net state debt on Dec. 31, 1940 totalled \$119,005,775, a reduction of more than \$11,000,000 during the past 18 months.

Agriculture, Manufacture, Mineral Production.—In 1939 Minnesota had 178,341 farms, with a total area of 30,423,719 ac. According to the United States Bureau of Agricultural Economics, Minnesota led the northwest in farm income gains that were general for the whole region, in the first ten months of 1940. Farmers in this period scored gains of more than \$55,000,000—the largest amount for any state over the same period in 1939. The gain in livestock and livestock products' sales increased more than \$8,000,000 in the first half of 1940. Gross income from crops, \$88,188,000; from livestock, \$244,578,000. The 1940 production of barley in Minnesota was 58,232,000 bu.; rye, 150,000 bu.; flaxseed, 12,230,000 bu.; hay, 4,732,000 tons; oats, 17,848,000 bu. Minnesota was third in the U.S. in spring wheat production with 34,215,000 bu. It led all states in the production of creamery butter with 297,325,000 lb. in 1939. It was second in production of milch cows and heifers and third in cattle.

Improvement in domestic, industrial and business activity was with a cause and a result of improved farm income. Numerous new industries were introduced, among them soybean and flax processing. Wages paid Minnesota employees who were covered by the unemployment compensation law, rose 7% in 1939 to \$497,862,511, an increase of \$32,000,000 over 1938. Manufacturing led the state to become the largest Minnesota industry among those reported. Industries showing largest increase were construction, up 15% over 1938, and mining and quarrying, which rose 19% in 1939. Of the nation's iron ore supply for 1939, 62% came from Minnesota mines. Fifty million tons of iron ore were produced in Minnesota in 1940. Total building and construction contracts were at the highest point since 1934. In nonagricultural establish-

ments, 542,000 persons were employed, an increase of 1.7% over 1939. Minnesota received about \$30,000,000 of initial defence orders, or about 1% of the total.

Minnesota, University of. The university experienced a further increase in enrolment and for the 1939-40 fall quarter again ranked second among American universities in regular collegiate enrolment. The net total enrolment for the year ended June 30, 1940 was 38,306, of whom 16,767 were women. Opened for use in the fall of 1940 for the first time were Ada Comstock hall, the new women's dormitory, and the \$2,000,000 Coffman Memorial union. The three upper floors of this new student union building house the Campus club, an organization in which membership is restricted to staff members. The remainder, constituting the major portion of the building, provides for the first time adequate social and recreational facilities for men and women students on an equal basis. Heretofore such facilities on a limited basis were provided separately in different buildings for men and for women. Buildings completed and put into service during 1939-40 were the journalism building, the museum of natural history and farm campus student health service building. Construction was begun on a field crops building for the farm campus. Dr. Theodore C. Blegen, professor of history, was advanced to the post of dean of the graduate school to fill the place made vacant by the death of Dr. Royal N. Chapman. (G. S. F.)

Minorities. The importance of minorities has grown in the 20th century with the spread of democracy and of the ideal of self-determination of all peoples. The existence of national minorities and their dissatisfaction with the situation had been one of the factors leading to the war of 1914-18. The Ottoman empire until 1913, the Austro-Hungarian monarchy and the Russian empire were outstanding examples of states containing national minorities which were dissatisfied. Germany had in its Polish provinces, in Schleswig and in Alsace-Lorraine, Polish, Danish and French minorities who longed for their liberation. In western Europe, the Irish in the British Isles, the Catalans in Spain and the Flemish in Belgium presented similar problems. Subsequently the Irish and Flemish problems were solved by the political developments in Great Britain and Belgium, and the peace treaties of Paris in 1919 reduced considerably the number of minorities under alien domination in central Europe. The frontiers drawn corresponded more faithfully to the ethnical conditions than the prewar situation did. Many small nationalities who had been deprived of their independence for a long time, regained it. For historical, economic and strategic reasons, however, the new frontiers left large minority groups outside the countries where their co-nationals formed the majority of the population. In view of the impossibility of creating ethnographically clear-cut boundary lines, the peace treaties devised a new and progressive system of protection for racial, linguistic and religious minorities through the League of Nations, so as to assure to the remaining minorities equality of treatment in the new states, where also the newly introduced democratic constitutions gave to all inhabitants full civic rights and equal status. This system of protection for the minorities broke down with the weakening of the League of Nations and with the advance of anti-democratic forms of government in central Europe. In 1939, together with the League of Nations and with some of the new states which had re-

THE UNITED STATES WATCHED its Japanese minority in California with extra care in 1940 as tension developed between the two countries. Many real estate owners prohibited Japanese from buying or occupying land

gained their independence in 1918, the system for the protection of minorities collapsed. Since then several other nations have followed Czechoslovakia and Poland in the loss of their independence; in the chaos which national socialist influence and conquest spread over Europe the minority problems gained in urgency, and many found themselves exposed to systematic atrocities without parallel in modern European history. All protection and all democratic guarantees for minorities were destroyed. Germany's aggression resulted in a situation for the minorities infinitely worse than that which had existed in the years before 1938 and definitely worse than that before 1914. National socialist Germany planned to reorganize Europe, not on the basis of the equality of all peoples and with an international protection for minorities, but on a hierarchical basis in which the German race would everywhere have the fullness of rights, while other peoples would be only subordinated according to the will and desire of the German master race, and minorities would be protected, if at all, by Germany alone and according to its conceptions of the worth and value of each individual people and each individual minority.

These new principles were clearly applied in Poland and in Bohemia and Moravia. The annexation of Czechoslovakia in March 1939 had put 7,000,000 Czechs, without any guarantee of their rights or liberty, under the national socialist regime with its peculiar concepts of law, liberties and racial equality. The conquest of Poland brought about 20,000,000 Poles under German domination. The national socialists proclaimed openly the racial inferiority of the Poles, who therefore were denied equal treatment with the German master race. All Poles were forcibly ejected from those large parts of Poland which Germany wished to annex outright. In the other districts they were allowed to continue to exist as a helot race performing subordinate economic functions, but deprived of higher education, of the possibility of forming a leader class and of any opportunity for economic or social rise. Thus they were to be prevented from ever again asserting their national aspirations or rights and were to be transformed into a denationalized and subservient mass with no will to resistance. The theory of racial inequality with all its consequences, first applied only to the Jews, was applied to other helpless nationalities as well.

During 1940 the soviet union annexed some of the territories which had formerly belonged to Russia. Lithuania, Latvia and Estonia thus lost their independence which they had gained

in 1918. The occupation of southern Finland, of Bessarabia of northern Bukovina added to the new populations which been brought within the soviet union by the occupation of eastern Poland in Sept. 1939. In conformity with its principles of racial equality, the populations incorporated into the soviet union were treated on a footing of equality and were granted linguistic autonomy, but they were subject to a complete communitarianization of their political, social and cultural life, and thus co-ordinated with the regime existing throughout the soviet union. While the soviet union is organized not as a national or racial state, but as a supra-national state on the basis of a federation of equal national republics, the minorities within the soviet union cannot be regarded as minorities in the technical sense of the word.

The new frontiers in central and eastern Europe brought German minorities there under new governments. While Germany wished the German minorities living in Slovakia, Hungary, Rumania to remain there, to enjoy special privileges and to act as guardians of national socialist interests and influence, she tried to remove all the German minorities from territories under the soviet union. These German minorities, although they lived in these homelands often for centuries, were forced to migrate to Germany and were resettled mostly in parts which formerly belonged to Poland or to Czechoslovakia, in an effort to Germanize these districts.

The dismemberment of Rumania did not solve any minority problem. Bessarabia, which was ceded by Rumania to the soviet union, had a predominantly Rumanian peasantry, although there were large Ukrainian minorities, while northern Bukovina, which shared Bessarabia's fate, was predominantly Ukrainian. The cession of southern Dobruja to Bulgaria brought a large Bulgarian minority back into Bulgaria. The treaty of Craiova between Rumania and Bulgaria foresaw the exchange of the Rumanian minority remaining in southern Dobruja for the Bulgarian minority in the northern Dobruja. The partition of Transylvania between Hungary and Rumania did not solve any minority problem; it left a small Hungarian minority in Rumania and created a large Rumanian minority in Hungary and exacerbated the feelings of the Rumanians. Through the gain of territory in the last two years Hungary received considerable Slovak, Ukrainian and Rumanian minorities and increased her own German minority. Yugoslavia was able to solve her most outstanding minority problem, that of the Croats, by accepting the principle of complete equality for the Serbs and Croats and granting the Croats a wide measure of linguistic autonomy; foreign influences, however, kept alive an extremist and irredentist movement among a small section of the Croatian people, so as to disintegrate Yugoslav unity. The Italians used the Albanian minority in the Greek Epirus as a pretext in their propaganda against Greece preceding the invasion of that country. The German conquest of the Low Countries and of France made so many dormant minority problems more acute. The Germans favoured the Flemish nationalists in Belgium and even seemed to support for a brief time a Breton independence movement against France. When Lorraine was annexed to Germany, and the French-speaking population as well as all those in sympathy with France were expelled from the country, which was quickly co-ordinated with the national socialist Germany and settled by immigrants from Germany. The victory of General Franco in Spain was inimical to the minorities there, especially the Catalans and the Basques, whose autonomy was taken away and who were subjected to a ruthless process of forced assimilation. The use of the Catalan and Basque languages was strictly forbidden. Throughout Europe, as far as national socialist influence reached, the status of the Jewish minorities became more and more tragic; they found themselves faced with the threat of complete annihilation. Especially catastrophes

the situation in Poland. The forced migration of persecuted is threatened to assume unprecedented dimensions, but it was in check by the difficulties imposed upon travel as a result of war conditions. Throughout the world the experience of the in 1940 and National Socialist propaganda tended to create minority problems and to accentuate existing ones on account of the fear of their possible use as "fifth columns." With the deterioration of international law and morality, the problem of minorities became increasingly acute. (For fuller figures on this, see JEWS, DISTRIBUTION OF.) (H. Ko.)

Mississippi, admitted as a state in 1817; popularly known as the "Bayou State"; area, 46,810 sq.mi.; population (U.S. census, 1940), 2,183,796; capital, Jackson, 62,107, largest city in the state. Of the state's population in 1940, 882 were urban, or 19.8%. In 1930 there were 1,000,103 whites; 1,009,718 Negroes; 1,999,429 native born; 7,145 foreign. **History.**—The state of Mississippi votes solidly the Democratic ticket. In the presidential election the following votes were cast: Democratic balloting, 168,267, regular Republican, 2,814, independent Republican, 4,549, Socialist, 193.

For 1940-44 principal officers of the state are: governor, E. B. Johnson; lieutenant-governor, Dennis Murphree; secretary of state, Walker Wood; attorney-general, Greek L. Rice; state tax collector, Carl N. Craig; state treasurer, Lewis S. Murphree; superintendent of education, J. S. Vandiver; presiding officer of the state senate, lieutenant-governor, Dennis Murphree; presiding officer of the house of representatives of the state, E. Lumpkin. The state senate has 49 members in addition to the presiding officer, the lieutenant-governor. The house of representatives has 140 members. In the membership of the state legislature farmers predominate with a total of 67 in the two houses; lawyers, 59; teachers, 23; merchants, 9; insurance agents, 13; with 13 other occupations represented in the membership with one to five to one member. All members of the legislature are members of the Democratic party.

Education.—The state maintains two systems of public schools, one for whites and one for Negroes, as required by the constitution. Consolidation of rural schools has been very extensive since 1930, the rural schools of all 82 counties of the state having been to some extent consolidated.

Banking.—There are in the state 182 state banks, including 10 branch banks, and 24 national banks, including one branch bank. Bank resources stood at \$227,509,327.34 on June 29, 1940, with deposits at \$198,963,260.96.

Agriculture and Manufactures.—Agriculture provided direct employment for 66.8% of the state's total population. Sixty-six percent of the total land area of the state is used for agricultural purposes, there being 311,683 farms covering 19,655,413 ac. in 1939, with a crop output of \$134,493,000, of which \$76,589,000 was cotton and \$12,282,000 was cottonseed.

Manufacturing in recent years has developed very rapidly, particularly manufacturing having to do with the use of cotton and the use of wood products. (A. B. Bu.)

Missouri, second state carved from the Louisiana Purchase, admitted to the union in 1821, popularly known as the "Show Me" state, occupies a central position in a group of states which comprise the great agricultural plain of the Mississippi valley.

Area, 69,420 sq.mi.; population (U.S. census, 1940), 3,784,664, a 4.3% increase over 1930. Capital, Jefferson City, 24,268. Largest cities (1940): St. Louis, 816,048; Kansas City, 399,178; St. Joseph, 75,711; Springfield, 61,238. Aliens (1940), 42,049.

MISSOURI'S NEW REPUBLICAN GOVERNOR, Forrest C. Donnell, elected Nov. 5, 1940

History.—During 1940 Missouri was the scene of several political battles. They began when U.S. Senator Clark clashed with Governor Stark for control of the Democratic state convention held on April 15. Clark was the victor; the convention, dominated by the Dickmann-Hannegan machine, the "courthouse rings," and the remnants of the Pendergast machine, adopted a platform barely mentioning Stark's administration. The same factions were again victorious in the Democratic primary on Aug. 6, as a

result of a split in the anti-machine forces. Governor Stark and former U.S. District Attorney Milligan, who were principally responsible for crippling the Pendergast machine in previous years, both entered the senatorial race and were defeated by the machine candidate, U.S. Senator Truman, incumbent. During the campaign preceding the general election in the fall, the principal contest for state offices was for the governorship. On election day, Nov. 5, the Republican candidate, Forrest C. Donnell, received the support of his own party and of a considerable number of anti-machine Democrats, and, according to official returns, defeated the Democratic candidate, Lawrence McDaniel, by a plurality of 3,613 (Donnell 911,530, McDaniel 907,917). The legislature challenged the accuracy of these returns (Jan. 1941), delaying the inauguration. The rest of the major state officers elected were Democrats: Frank G. Harris, lieutenant-governor; Dwight H. Brown, secretary of state; Forrest Smith, auditor; Wilson Bell, treasurer; Roy S. McKittrick, attorney-general. Twenty-eight Democrats and six Republicans were elected to the state senate, and 85 Democrats and 65 Republicans to the house of representatives. A constitutional amendment was adopted, providing for the establishment of a nonpartisan system for the nomination, appointment and election of judges of certain courts.

The popular vote for president was Roosevelt 958,476, Willkie 871,009; for U.S. senator, Truman (Dem.) 930,775, Davis (Rep.) 886,376. The congressmen elected were 10 Democrats and 3 Republicans.

Education.—For the school year ending June 30, 1940 the public school system consisted of the University of Missouri, Missouri School of Mines and Metallurgy, five state teachers colleges, Lincoln university (Negro), schools for the deaf and blind, Negro vocational school, 9,417 elementary schools and 943 high schools. For the same period there were 506,173 pupils and 18,311 teachers in elementary schools and 198,864 pupils and 8,058 teachers in high schools; total disbursements of the school districts were \$56,620,150.

Charities.—During Aug. 1940 public assistance and public work earnings amounted to \$7,627,884. In November old-age assistance for 106,746 persons averaged \$14.96. Unemployment compensation payments from January through Nov. 1940 totalled \$6,667,057. During the same period the Missouri State Employ-

ment service placed 78,215 in private industry (27.9% increase over same months of 1939) and 8,869 in public employment. To meet the crisis caused by the exhaustion of the general relief fund, the legislature convened in special session (July 22-27, 1940) and appropriated \$1,500,000, just enough for the remainder of the year.

Finance.—The balance in the state treasury on Dec. 31, 1938 was \$21,226,021.10; receipts for 1939, \$93,328,761.62; disbursements 1939, \$93,446,420.27; balance in state treasury Dec. 31, 1939, \$21,108,362.45. The total state bonded indebtedness on Dec. 31, 1939 was \$103,255,000; on Dec. 31, 1940, \$96,483,000.

Agriculture, Manufactures, Mineral Production.—In 1939 Missouri had 217,520 farms with a total acreage of 35,371,000, of which 15,264,000 ac. were devoted to crops and 15,445,800 to pasture. In 1938 it ranked fourth among the states in number of hogs on farms, fifth in horses, eighth in cattle, ninth in mules, and 11th in sheep; seventh in quantity of corn, oats, and grain sorghums produced, eighth in winter wheat, and 11th in tame hay. In 1937 Missouri ranked 10th among the states in number of manufacturing establishments, 12th in value of products and in amount of wages and 13th in number of wage earners. The value of the state's mineral products for 1938 was \$39,560,739. In the same year Missouri's place among the states was first in value of lead and barite produced, second in chats, third in lime and fourth in raw clay. During 1939 Missouri produced 156,281 tons of lead, which was 37.8% of the total output in the U.S.

(R. P. BR.)

Mix, Tom (1880-1940), U.S. motion picture actor, was born in El Paso county, Texas, Jan. 6. He worked as a cowboy in Texas, Arizona, Wyoming and Montana and served with the U.S. army in the Philippines, in the Spanish-American war and during the Boxer rebellion in China. Later he served in the British army during the Boer war in South Africa. He was a deputy sheriff in Oklahoma and served with the Texas Rangers for three years. He began to act in motion pictures in 1910, playing the part of a rough-riding hero. In 1933 he organized the Tom Mix circus and wild west show, after he had been with the Sells Floto circus. He died in Florence, Ariz., Oct. 12, in an automobile accident.

Modjeski, Ralph (1861-1940), U.S. engineer, was born in Cracow, Poland, Jan. 27, and died in Los Angeles, Calif., June 26. For a biographical sketch see *Encyclopædia Britannica*, vol. 15, p. 642.

Mohammedanism: see ISLAM.

Molotov, Vyacheslav Mikhailovich

(1890-), Russian statesman, was educated at Petersburg polytechnic and during his youth organized bolshevik student groups and worked for the newspaper *Pravda*. February of 1917 found him a member of the Petrograd soviet executive committee. In 1920 he was appointed secretary of the central committee of the communist party of the Ukraine, and in the following year he held this office for the whole of the U.S.S.R. He was appointed president of the Soviet of People's Commissars in 1930 and continued to hold the office of premier after he was named foreign commissar May 3, 1939 to succeed Maxim Litvinov. The latter appointment foreshadowed the radical shift in soviet foreign policy which led to the nazi-soviet pact of non-aggression, signed by Molotov in Moscow, Aug. 24, 1939. Upon the outbreak of war a week later, Molotov entered upon a furious period of diplomatic activity that continued throughout 1940. On several occasions

during the year, notably in his speeches of March 29 and Aug. 1 before the supreme soviet, Molotov reaffirmed Russia's peace intentions and criticized the Allies for their "imperialist" intentions. A highlight of that year was his visit to Hitler in Berlin Nov. 11 and 13. On his 50th birthday, March 9, he was eulogized by the soviet press, and two cities and districts were named for him. (See UNION OF SOVIET SOCIALIST REPUBLICS.)

Molybdenum. The United States is the foremost producer of molybdenum, with about 87% of the world's recorded production to date, and a current output of about 9% of the total. Australia, Chosen, Japan, Spain and Sweden have contributed in the past, but are no longer active; Norway has long been a producer, but contributes only 3% of the current output, while Mexico, which first produced in 1932, now supplies 3%. Morocco, beginning in 1933, now adds another 1%, and various smaller producers the same amount, making a total of 150 metric tons in 1939 against 16,340 tons in 1938, the first decline in output since 1932.

(G. A. ROSE)

Monaco. A principality on the Mediterranean coast, bounded on the land side by French (unoccupied) territory. Area 375 ac. (0.59 sq.mi.); pop. (1939), 23,975. Chief town, Monaco, La Condamine, Monte Carlo; ruler: Prince Louis II. Language: French. The chief occupation is catering for visitors, who, before the days of the war of 1939, numbered more than 2,000,000 annually.

Monetary Units of Leading Countries: see EXCHANGE CONTROL AND EXCHANGE RATES.

Mongolia (INNER AND OUTER) is a vast sparsely populated tableland, arid and desert in stretches, occupying about 1,000,000 sq.mi. in northeastern Asia. It is bounded to the north by Siberia, on the east by Manchoukuo, on the west by Sin Kiang (Chinese Turkestan), on the south by China Proper. Of these two parts of Mongolia, Outer Mongolia (622,744 sq.mi.) is greater in size; but Inner Mongolia (334,100 sq.mi.), including the Chinese provinces of Chahar, Suiyuan and Ningsia, is more thickly populated. It is estimated that the population of Outer Mongolia consists of 750,000 Mongols and 100,000 others (mostly Russians and Chinese), while there are about 1,500,000 Mongols in Inner Mongolia.

History: Inner Mongolia.—During the '20s of the present century this region was the scene of a constant struggle between the Chinese farmers, who were moving into the country from more crowded parts of China and beginning to cultivate the land, and the Mongols, who wished to reserve the land for pasture. This further element of friction and confusion was created because Mongol princes in some cases alienated tribal lands, without due legal authority, to wealthy Chinese, sometimes government officials, who then proceeded to parcel out the land for colonization. This element of chronic dissension between the Mongols and the Chinese favoured the expansionist plans of the Japanese army. Soon after the establishment of Manchoukuo, Japanese influence began to spread into Inner Mongolia.

For a time the chief political force in that region was the Mongolian Autonomous Political council, headed by Prince Teh, who tried to hold a balance of power between the Japanese and Chinese and to assure his own people as much independence as possible.

This situation came to an end when the Japanese invaded North China in force in 1937. Prince Teh had little alternative except to cast in his lot with the invaders. He ultimately became head of the so-called Autonomous Government of Mongolia, established with headquarters at Suiyuan in Oct. 1937. This

is provided with Japanese political and military advisers. Other autonomous regimes under strong Japanese influence were set up in the leading industrial and trade centres of Inner Mongolia, Tatung, located in the midst of the vast coal fields of North Shansi, and Kalgan, in South Chahar. Japanese monopolist organizations have taken over the Mongolian wool trade.

Outer Mongolia.—The republic of Outer Mongolia was set up as a direct result of the invasion of the country by soviet troops, who were pursuing the far eastern Russian "White" leader, Baron Ungern-Sternberg, who had utilized Outer Mongolia as a base of operations against Siberia. With this soviet aid a so-called People's Revolutionary government was established in Urga (now renamed Ulan Bator) and soviet influence has been so dominant in the country since that time that very few foreigners have been able to visit it. According to the constitution of Outer Mongolia, power is vested in a parliament called the Great Khural.

Trade and cultural contacts have been exclusively with the soviet Union and soviet institutions have been implanted in Outer Mongolia, with modifications made necessary by the pastoral non-industrial character of the country and the ownership of much of the land by lamaseries, or monasteries inhabited by the lamas. Soviet anti-religious and agrarian policies could not be applied unchanged in Outer Mongolia; a drive for collectivization which was pressed between 1929 and 1932 led to uprisings and a flight of some of the Mongols across the frontier into Inner Mongolia. There was then apparently a mitigation of this policy; but independent information about developments in Outer Mongolia is almost nonexistent.

After the Japanese occupation of Manchoukuo there were periodic border skirmishes between Manchoukuo and Outer Mongolian troops, mostly in the vicinity of Lake Buir. Some of these conflicts assumed a more serious character, especially in the northern region in the summer of 1939, when Japanese and soviet aeroplanes and tanks were brought into action.

There is an air line between Ulan Bator and Verkhne-Udinsk, in Siberia and a highway between Ulan Bator and the Siberian frontier town of Kyakhta and a small railway has been built to facilitate the working of coal mines near Ulan Bator.

BIBLIOGRAPHY.—H. H. Howorth, *History of the Mongols from the twelfth to the Nineteenth Century*; Henning Haslund, *Tents in Mongolia*; Owen Lattimore, *The Mongols of Manchoukuo*; *China Year Book*, 1936 (chapter II). (W. H. CH.)

Montana, a northwestern State of the United States admitted Nov. 8, 1889, popularly known as the "Treasure State"; area 146,572 sq.mi. (third largest in the union); population according to the U.S. census of 1940, 559,456, a percentage increase of 4.1 and a numerical gain of 21,850 since 1930. Capital, Helena, 15,056, which is the fifth city in size in the state. Other cities of 10,000 or more are: Butte, 37,081; Great Falls, 19,928; Billings, 23,261; Missoula, 18,449; and Anaconda, 11,004. Of the state's population, 211,535 are urban, or 37.8% as compared with 33.7% in 1930; and 16,583 are Indians.

History.—In the quadrennial election of 1940, Sam C. Ford was elected governor (first Republican governor in 20 years), with a Republican senate and a Democratic house of representatives. Other state officers elected were Ernest T. Eaton (Rep.), lieutenant governor; Sam Mitchell (Dem.), secretary of state; John J. Holmes (Dem.), state auditor; Thomas Carey (Dem.), state treasurer; John W. Bonner (Dem.) attorney general; Elizabeth Ireland (Rep.), state superintendent of public instruction; Paul T. Smith (Dem.), railroad commissioner.

Jeannette Rankin (Rep.) and James F. O'Connor (Dem.), were elected representatives to congress. Senator Burton K. Wheeler (Dem.), was chosen for a fourth term in the United States senate.

President Roosevelt carried the state with a vote of 145,698 against 99,579 for Willkie; 1,443 for Thomas; 664 for Babson and 489 for Browder.

Education.—There are (1940) about 75 city and public libraries in the state, over half of which are tax supported. In 1939-

SAM C. FORD, governor of Montana, elected Nov. 5, 1940, on the Republican ticket

40, the public schools, with a budget of approximately \$13,500,000, enrolled 74,791 pupils in the grades and 32,045 in the high schools. The six units of the University of Montana had an income of \$1,680,111 and a total registration of 5,454. In the 1940 election by legislative referendum the 1930 3-mill special levy for the support of the university units was increased to 3½ mills for the next ten-year period. An initiative measure authorizing an \$850,000 bond issue for necessary buildings at Montana

State college was defeated. Other collegiate institutions are Billings Polytechnic institute and Carroll college.

Charities and Correction.—The state supported institutions for orphans, tuberculars, blind, deaf, dumb and insane; also reform schools for boys and girls, and a state penitentiary. A 1940 legislative referendum carried, authorizing a \$500,000 bond issue for improvements at the state hospital for the insane.

Finance.—The net bonded debt of the state was \$9,261,282. The state income in 1940 was approximately \$33,700,000. The net indebtedness of the 56 counties was \$6,587,320 and their tax income was \$9,340,000. City and town indebtedness was \$4,557,646, and their tax income was \$4,000,000. School districts with a net indebtedness of \$8,511,000, had a tax income of \$9,849,500 in 1939-40. The total tax delinquency in 1940 amounted to \$15,508,321.

Agriculture, Manufactures, Mineral Production.—Montana farms and ranches (area 47,400,000 ac.) produced crops worth \$61,483,000, in 1940. The leading crop was wheat, of which 60,811,000 bu. were raised. Other important crops produced were 2,465,000 tons of hay, 1,134,000 tons of sugar beets and 9,000,000 bu. of oats. The apple crop declined to 236,000 boxes. On the ranches are 1,107,000 cattle, 3,548,000 sheep, and 258,000 horses. Montana forests with an area of 14,613,000 ac. contain 50,000,000,000 bd.ft. of standing timber. Lumber production in 1940 amounted to 269,500,000 bd.ft. An abundance of electrical energy furnishes power for mills, factories and railroads. Metal production for 1940: copper, \$28,611,600; gold, \$9,649,500; silver, \$8,787,200; zinc, \$6,727,500; lead, \$2,195,000—a total of \$55,970,800 and an increase of 37% over 1939. Smelters for treating the ore are located at Anaconda and East Helena, and there is an important electrolytic refinery at Great Falls. Coal production amounted to 2,974,000 short tons and 6,768,000 bbl. of petroleum were produced, compared with 5,961,000 bbl. in 1939.

BIBLIOGRAPHY.—Harold E. Briggs, *Frontiers of the Northwest* (1940). (E. E. B.)

Montreal, in the province of Quebec, Canada, is on an island at the confluence of the Ottawa and St. Lawrence rivers, approximately 1,000 mi. from the Atlantic ocean and 2,760 mi. from Liverpool. It is at the head of ocean navigation

and the terminus of lake vessels. It is served by three canal systems, the St. Lawrence canals, 1,230 mi. to the Great Lakes, the Eastern United States canals, via the Richelieu river and Lake Champlain, 127 mi., and the Ottawa river canals, 119 mi. The head offices of the Canadian Pacific railway and of the Canadian National railways are situated at Montreal.

Population of the city of Montreal (federal census, 1931), 810,925, and of greater Montreal, including its suburbs, 973,637. In 1940, as estimated by Lovell's *Directory*, the population was: city of Montreal 1,294,792, greater Montreal 1,476,737. Greater Montreal is governed by a metropolitan commission, the majority of whose members are appointed by the city council of Montreal.

For election purposes, the city is divided into 11 districts. Each district elects six councillors, of whom three are elected by proprietors only and the other three are elected by all electors of the district. This accounts for 66 members. The other 33 councillors are appointed by a number of public bodies.

The mayor is elected by the electors of the city at large. He is not a member of the executive committee. He is paid for his services as mayor.

The council appoints from among its members six councillors to act as an executive committee. The members of the executive committee are paid for their services.

The port of Montreal is the largest in Canada. War conditions have accelerated its activity, but the censor has requested that statistics should not be published.

For 1940 the amount of building permits issued stood at (new) 1,254, value \$8,937,971; (repairs) 2,136, value \$2,489,661; bank deposits (for 11 months ended Nov. 30, 1940) \$7,892,470,189 and bank clearings (for 11 months ended Nov. 30, 1940) \$4,751,565,739. The assessed value of real estate was \$1,245,526,539.

Mormons. The church devoted much effort and considerable expenditure in perfecting and enlarging its welfare program, principally along three lines: It built at Welfare square (the home of the principal welfare storehouse) a modern, thoroughly equipped grain elevator with a capacity of 200,000 bushels. This was filling in 1940 with first grade flour wheat. The church, in addition, had a grain elevator in southern Idaho (capacity approximately 80,000 bushels), and a smaller elevator in mid-Utah with a capacity of 10,000 bushels—a total elevator capacity of nearly 300,000 bushels, sufficient to furnish bread for approximately 50,000 people. While the church furnished the storage, the National Woman's Relief society (a church women's charitable organization) supplied the wheat.

The General Welfare committee intensified its efforts in pushing forward its plans to make the welfare program produce all the materials used by it for distribution to the needy. To this end a church-wide survey was made of assistance needed. Based on scientific studies of the church and the government, an estimate was made of the amount of food, clothing, fuel, shelter required to supply the needs. This total amount was divided among the several component administrative units of the church—stakes (and by them divided among their respective sub-units—wards), each unit, large and small, being assigned its quota of designated articles. In 1940 the program produced more than 50% of all it distributed. The total help extended for 1941 will be approximately 75% program-produced. In 1939 the church extended assistance to more than 50,000 worthy church members.

The church extended its efforts to the building up of its Deseret

industries—the equivalent of the Goodwill industries of other organizations—by which it takes old clothing, shoes, furniture, toys, clocks, musical instruments, etc., and rebuilds them for sale to the public. The General Welfare committee added a department which buys new cloth, cuts it for women's and children's clothing of various kinds, then sends it to various Woman's Relief society organizations, who do the sewing and give voluntary free service. This was supplied then to the various distributing agencies for the original cost of the cloth. (J. R. CL.)

Morrow, Honoré (Willsie) (1880–1940), U.S. author, was born in Ottumwa, Ia., the daughter of William Dunbar McCue. She was graduated from the University of Wisconsin, and then went to Arizona. While there she wrote her first book, *The Heart of the Desert*. After two years in the west she went to New York city and was editor of *The Delineator* for five years from 1914. Among her many novels were three dealing with the life of Lincoln. She also wrote biographies of A. Bronson Alcott, Mary Todd Lincoln and John B. Gough. She was twice married. Her second husband was William Morrow, a publisher. On his death in 1931 she married her home in Brixham, England. She died in New Haven, Conn. April 12.

Motion Pictures. The motion picture industry, born in 1895, entered its 52nd year in 1941 generally committed in the United States to a policy of fewer and better pictures, with accent on American themes. Cumulative effects of the wars abroad were the greatest influence bearing upon the industry in 1940. Continued shrinkage of foreign markets caused increasing attention to the domestic market. Industry leaders expected that defence spending would have a stimulative box-office effect in 1941. Though a difficult year economically, 1940 witnessed the production of a surprisingly large number of significant and outstanding pictures.

Estimated capital investment in the motion picture industry in the United States (statistics of Motion Picture Producers and Distributors, Inc.):

Theatres	\$1,000,000,000
Studios	125,000,000
Distribution	25,000,000
	\$2,050,000,000

Because of uncertainty caused by war, there was practically no building or other capital investments in 1940.

Gross returns in all United States theatres during the year were estimated at \$1,000,000,000, of which \$100,000,000 went to the federal government and \$250,000,000 to state and local governments for taxes. An estimated 287,500 persons were given employment in exhibition, production and distribution, the year's payroll being placed at approximately \$370,060,000.

In general, industry statistics must be considered as approximations. The system of film rentals is extremely complicated. Employment swings in wide arcs. Despite all attempts at production standardization, pictures cannot be rolled out on an assembly line as can automobiles. However, even in the face of rising labour costs, the studios seem to be making some headway toward economy, without reflecting upon quality. This means elimination of "dead wood" left over from the old lush days, increased concentration on technical improvements, efficiency and more careful planning.

Estimates on the weekly attendance at U.S. motion picture theatres ranged from 50,000,000 to 85,000,000. The industry was seeking to enlist the interest of those millions of American

who, though financially able, seldom see pictures.

Chinese and Japanese markets remained lost to American films. With the German invasion of the Low Countries and the reduction of France to a state of vassalage, continental Europe was practically closed to American pictures in 1940. Even in the few small countries still taking American products, currency restrictions made the market of negligible importance. The British empire, the best foreign market for American films, also was compelled to adopt currency restrictions to husband its resources in the battle for existence. However, the close of the year saw arrangements made for an estimated release of \$12,500,000 in English proceeds to American companies.

Latin-America became the best possibility for market development. From a financial standpoint, there has been a tendency to over-rate its importance, as the region's per capita income is not high. However, Latin-America has become a political as well as an economic battleground for American films. Partly by their nature, partly through circumstances, they are playing an important role in the campaign for Pan-American solidarity. Regarded as the spearhead of democratic influence, American pictures were being bitterly opposed by the axis powers. Latin-America was being flooded with totalitarian films, even to the point, according to report, of free distribution. As the year ended, it was uncertain as to whether Charles Chaplin's *The Great Dictator*, burlesquing Hitler and Mussolini and pleading for world peace and tolerance, could be shown in a number of Latin-American countries. Among these were Brazil and the Argentine, the two greatest South American powers, where the influence of German and Italian minorities was especially strong. Axis diplomats accredited to Latin-American countries were said to be using their official influence to ban American pictures regarded as unfavourable to totalitarian doctrines. Economic pressure was applied, and, as the nations of Latin-America were at peace, their position was more or less delicate. In addition to *The Great Dictator*, such pictures as *Confessions of a Nazi Spy*, *The Mortal Storm* and *The Man I Married* were foci for political conflict. Showing of such pictures in Latin-American countries was frequently the signal for rioting, especially in Mexico, assertedly due to subversive influences.

During 1940 a cycle of pictures with Latin-American themes started in Hollywood. The future is expected to see this trend increase. The first films were of a musical nature, with Rio de Janeiro and Buenos Aires supplanting fallen Paris as symbols of glamorous living. As part of the U.S. government's program, John Hay Whitney was working with the studios toward the production of pictures designed to strengthen Pan-American amity.

As the concern of Americans over affairs abroad steadily increased, this was reflected in the motion picture industry. European producers had long envied the American industry's freedom from government control and interference. American pictures have to please the people, not the government.

In the matter of preparedness and defence, the industry's co-operation was given freely and enthusiastically. The industry knew that its existence depended upon the survival of democracy. Its freedom of expression was in 1940 limited only by concern for public opinion. As constituted, it could not exist under a totalitarian regime.

Because of the industry's financial structure, American pictures must necessarily have wide box-office appeal. It is significant that pictures of wide appeal have come only from democratic countries. Until the war limited production, England was producing pictures that ranked with America's best, and France was taking great strides forward.

The dawn of 1941 found practically every Hollywood studio

considering pictures with conscription as a theme. Studios were active, especially in the short subjects field, in the production of films stimulating interest in the nation's armed services. Hollywood was being self-surveyed with a view to best contributing its technical skill to the national defence.

As a period of widespread distress, 1940 was a year of giving in Hollywood. Under the leadership of Louis B. Mayer, \$464,000 was raised for the Community Chest, and, under Samuel Goldwyn, \$440,000 was contributed to the Red Cross.

After considerable bewilderment, the industry learned in 1940 that a large section of the American people apparently wanted their entertainment distinct and separate from their information.

Periods of dramatic intensity in the war, such as the invasion of the Low Countries, found many people at home listening to radio broadcasts, with the theatres suffering a resultant drop in revenue. Theatre owners, misled by the popularity of radio war news, were surprised to find their patrons objecting to war subjects as the theme of feature films. As anti-totalitarian sentiment in the United States mounted, interest in anti-totalitarian features seemingly decreased. More and more the American people were coming to regard the theatre as "a place for entertainment." This tendency to distinguish between entertainment and information was reflected in the rise of theatres devoted solely to newsreels and short subjects. Censorship in the warring countries, however, made it practically impossible for American newsreel units to obtain their own material. Releases put out by the belligerent governments constituted most of the war material reaching the American screen. The year found American newsreel companies withdrawing units from the war areas, and stationing them in South America.

More outstanding pictures than in any previous year distinguished 1940. Among them were *Rebecca*, *Foreign Correspondent*, *Dr. Ehrlich's Magic Bullet*, *The Great Dictator*, *Boom Town*, *Northwest Mounted Police*, *Fantasia*, *The Sea Hawk*, *Tin Pan Alley*, *Grapes of Wrath*, *The Philadelphia Story*, *Knute Rockne—All-American*, *Arise, My Love*, *The Great McGinty*, *The Letter*, *The Long Voyage Home*, *Our Town*, *The Mortal Storm*, *The Thief of Bagdad* and *Kitty Foyle*.

The *Motion Picture Herald* reported that its 1940 exhibitor poll on the ten top box-office stars found youthful Mickey Rooney again in first place. He was followed by Spencer Tracy, Clark Gable, Gene Autry, Tyrone Power, James Cagney, Bill Crosby, Wallace Beery, Bette Davis and Judy Garland.

The New York film critics' award for the year's best picture went to Twentieth Century-Fox's *Grapes of Wrath*, from John Steinbeck's controversial novel dealing with "refugees" from the midwestern drought areas. The best direction award went to John Ford for *Grapes of Wrath* and *The Long Voyage Home*. The preceding year Ford was similarly honoured, for *Stagecoach*. The Award for best actor performance went to Charles Chaplin in *The Great Dictator*, the best actress performance to Katharine Hepburn in *The Philadelphia Story*.

A special award was voted to Walt Disney, Leopold Stokowski and their associates for *Fantasia*. From an artistic standpoint this was undoubtedly the year's most significant picture. Hailed by critics as the creation of a new art form, it immediately became the subject of violent controversy, especially in music circles. *Fantasia* is a concert illustrated by animated drawings in Technicolor. In it Disney gives his interpretations of selections from Beethoven, Bach, Schubert, Stravinsky and others (played by the Philadelphia symphony orchestra, Stokowski conducting) in visual effects ranging from dances of flowers to the life of prehistoric monsters. For some time to come, *Fantasia* will be limited in its exhibition by the necessity for special sound apparatus. This special equipment, christened "Fantasound," will

developed by Disney technicians and Radio Corporation of America engineers.

During 1940, *Gone With the Wind*, released late in 1939, established itself as the top grossing picture of all time. Showing at advanced prices, with its general release to come in 1941, gross was estimated at \$18,000,000, with an ultimate of \$25,000,000 expected. Its cost was placed at about \$4,000,000.

Other pictures of the year with grosses estimated in the millions were *Northwest Mounted Police*, *Boom Town*, *Foreign Correspondent*, *Andy Hardy Meets a Debutante*, *Rebecca*, *The Great Dictator*, *The Philadelphia Story* and *Kitty Foyle*. *The Great Dictator* was expected to gross \$3,500,000 in the United States and Canada, a sum exceeded by other outstanding Chaplin pictures in the world markets were still free. Despite war conditions, it drew large audiences in England as did *Gone With the Wind*, *Northwest Mounted Police*, and surprisingly, *Knute Rockne—All-American*, based on American football. Grosses in the millions were, of course, rarities. In general, the studios, through trimming production costs, hoped to realize profits on smaller grosses.

Hollywood made 584 feature pictures during the year; 530 in 1939.

Because of the war, few important foreign pictures were shown in the United States in 1940. Outstanding were: English—*Pastor Luther*, anti-Nazi film with a foreword by Mrs. Franklin D. Roosevelt; French—*The Baker's Wife* and *Hotel du Nord*, with Anna-Louise. The New York critics voted *The Baker's Wife* the best foreign picture of the year.

The war brought some of Europe's best talent to Hollywood: Alfred Hitchcock, whose *Foreign Correspondent*, *They Knew What They Wanted* and *Rebecca* placed him as one of the year's outstanding directors; Alexander Korda, whose \$2,000,000 *Thief of Bagdad* was begun in England and finished, because of war, in the United States; René Clair, famous French director, under contract to Universal; and Erich Pommer, former UFA producer.

The trend in American pictures in 1940 was away from propaganda motifs and biographical pictures, the latter receding from 1939 popularity. Pictures dealing with the American scene, especially the so-called glorified "western" or action picture, such as *Northwest Mounted Police*, and musicals came increasingly to their own.

During the year, Hollywood's economy efforts were aided by reductions in raw film prices and in the price of Technicolor release prints. The studios showed an increased interest in Technicolor. Among the outstanding Technicolor pictures were *Fantasia*, *Thief of Bagdad* and *Northwest Mounted Police*.

Consent Decree.—The government's anti-monopoly action against the industry resulted in the so-called "consent decree," agreed in by most of the larger companies. This calls for the abolition of "block booking" and "blind selling," under which exhibitors contracted, in advance, for a studio's entire yearly production. The decree provides that pictures shall be sold only in minimum blocks of five, and only after they have been seen by exhibitors at regional showings. Hollywood believed this would result in fewer and better pictures, thus contributing to the gradual elimination of the double feature bill. Agitation by exhibitors of the industry against double features reached a peak in 1939. In August Dr. George Gallup, director of the American Institute of Public Opinion, reported that a nation-wide poll showed 60% against double feature bills. The dual bill, it was found, was most popular with children and persons in the low income brackets. It was believed that this condition, coupled with the expense of selling under the consent decree, would militate strongly against production of "B" or second-grade pictures.

Labour.—Labour conditions in general were peaceful compared with 1939. It was estimated that further reductions in the amount

ONE OF THE MOST PUBLICIZED MOTION PICTURES of 1940 was the German *Feuertaufe* (*Baptism of Fire*), a pictorial summary of the Polish campaign which had its première April 6, on the eve of the Norwegian invasion. Part of the picture was incorporated into the American-produced *The Ramparts We Watch*

of labour employed took place during the year. Decrease in the amount of work given "extra" players was noteworthy.

Censorship.—Under the direction of Will H. Hays, for 17 years head of the Motion Picture Producers and Distributors of America, Inc., the principal producers continued under a voluntary censorship. The most serious criticism of this idealistic scheme was that it sometimes sacrifices artistic integrity to considerations of security at the box office—but always in the name of public morality.

Awards.—*Gone With the Wind* swept the 1939 awards of the Academy of Motion Picture Arts and Sciences (announced in Feb. 1940) as no other picture had ever done. It was voted the best picture of the year, and to its producer, David O. Selznick, went the Irving Thalberg Memorial award "for most consistent high quality achievement by an individual producer."

Other *Gone With the Wind* awards were: best actress, Vivien Leigh, the English actress, for her role of Scarlett O'Hara; best supporting actress, Hattie McDaniels, Negro actress; best direction, Victor Fleming; best colour cinematography, Ernest Haller, Ray Rennahan; best screen play, the late Sidney Howard; best art direction, Lyle Wheeler; best film editing, Hal Kern (supervisor), James Newcom. In addition, a special award went to William Cameron Menzies for outstanding achievement in the use of colour for the enhancement of dramatic mood in the production of *Gone With the Wind*.

Other awards of the academy were: best actor, Robert Donat, the English actor, in *Goodbye, Mr. Chips*; best supporting actor, Thomas Mitchell, in *Stagecoach*; best black-and-white cinematography, Gregg Toland, *Wuthering Heights*; best original film story, Lewis R. Foster, *Mr. Smith Goes to Washington*; best sound recording, Bernard B. Brown, *When Tomorrow Comes*; best original score, Herbert Stothart, *The Wizard of Oz*; best scoring, Richard Hageman, Frank Harling, John Leipold, Leo Shuken, *Stagecoach*; best song for picture, E. Y. Harburg and Harold Arlen for "Over the Rainbow," from *The Wizard of Oz*; best special effects, Edmund H. Hansen, *The Rains Came*. Judy Garland was voted a special award "for her outstanding performance as a screen juvenile" in 1939. In the short subjects field, the award for the best cartoon went to Walt Disney's *The Ugly Duckling*; 1,000 feet or less—Paramount's *Busy Little Bears*; 1,000 to 3,000 feet—Warner Brothers' *Sons of Liberty*.

During 1940 two pioneer stars, outstanding in their time and known to millions of fans all over the world, Tom Mix and Marguerite Clark, died.

(L. O. P.)

Technical Developments.—The year 1940 saw the first wide-

spread use of photographic objectives and projection lenses which were treated with anti-reflection coatings. The evaporation method of depositing thin films on glass surfaces was perfected to the point where reliable and consistent reduction of reflection at glass-to-air surfaces could be secured on the various lens types commercially employed. The contrast of the image produced by coating the lenses is greater than that produced by untreated lenses, due to the elimination of multiple reflections between the several lens elements.

This improvement has been found of particular value in theatre projectors, since it is extremely difficult to secure sufficiently high values of screen illumination even when the projectors are equipped with high intensity arc systems. Likewise, studios' special effects photography departments find the treated lenses of great value in securing the necessary illumination levels on process projection screens.

Built-in electro-optical slating mechanisms (for film identification purposes), providing for a complete photographic record of each scene while the cameras are coming up to normal operating speed, were introduced during 1940 at Twentieth Century-Fox and Paramount studios.

An arbitrary system of lens calibration was established at the Twentieth Century-Fox studios. Its camera department successfully recalibrated all of the lenses employed by that studio for photographic purposes by photo-electrically recalibrating all lenses against a single selected standard objective. The standard "F" system of stop-markings has been retained, but the diaphragm markings have been so re-engraved that all of the lenses employed by that studio will give identical negative exposures when employed at identical stop settings.

During 1940 the National Carbon company made available to the various studio special effects photographic departments a new type of carbon for projector arc lamps, the structure and composition of the new carbon being such that approximately 20% greater light output is secured from the arc for a given value of arc current than was formerly obtained.

Realism in battle scenes, involving the use of machine guns, has often been obtained by firing blank cartridges in the guns. Warner Bros. studio has developed equipment which permits firing, at any predetermined rate, charges of acetylene gas mixed with air. The sound of firing and the spurts of flame at the gun muzzle closely simulate these features of a gun operated in the normal manner. By this method, the guns are rendered completely harmless to members of the cast.

A difficult production problem was overcome at Warner Bros. studio during the year 1940 by the construction of a special large stage to house ships employed in the production of feature pictures, such as *The Sea Hawk* and *The Sea Wolf*.

The ships photographed in *The Sea Hawk* were full-scale models, the larger one weighing approximately 292½ tons, and the smaller one weighing 116½ tons. The larger ship was supported by a series of hydraulic jacks, so constructed and interconnected as to permit giving pitching and rolling motions to the vessels, which accurately simulated any motion which the ship would normally experience at sea. The master control unit installed in the hydraulic system permitted complete control of the motion of the larger ship and the synchronization of these motions, when necessary, with those of the smaller vessel. The smaller vessel was also mounted on hydraulically operated jacks. The small ship and its supporting jacks were mounted on a car, by means of which the ship could be moved across the stage. The entire system was designed to operate under water, since the stage floor had to be flooded for the sea scenes.

Proper appearance of the surface of the sea on background screens was obtained through the development and construction of a novel type of ripple machine. These machines consisted of three heavy cellophane screens suspended vertically behind muslin drop curtains employed for painted backgrounds, each cellophane screen bearing a series of opaque stencilled wave patterns. Suitable differential, vertical, oscillatory motion was imparted to the three screens through a system of shafts and cams, so that when the ripple screens were illuminated from behind, a continuously varying ripple pattern was projected on the background drop curtain. The degree of perfection of the illusion created by this device can only be fully appreciated when it is actually seen in operation.

The mechanical department of Warner Bros. studios also developed a new type of fog machine capable of generating a fog of sufficient density to remain near the floor of the enclosure in which it is used. The new type of fog machine passes atomized oil over layers of dry ice before it passes into the set from the generating unit. The chilling of the vapours results in a sufficient increase in density to cause the atomized particles to remain suspended near the floor of the set for a considerable period of time.

While the past years have been credited with the technical developments of such items as the silent treadmill by Paramount studios, the triple head projectors by Warner Bros. and Paramount studios and the new Mitchell silent and superportable transparency projectors, the technique of using all of these in combination reached its high point during 1940, as indicated by the increased use of background projection photography by reason of these developments, with greatly enlarged screens and colour backgrounds at Warner Bros. and Paramount studios.

Films.—While no outstanding new developments in the manufacture of film came to light during the year 1940, the Eastman Kodak company did announce a new film lacquer, which may be employed as a protective coating over the film emulsion. This lacquer provides a surface of sufficient gloss to practically eliminate the mottling effect caused by oil on the emulsion surface. The lacquer may be completely removed from the emulsion surface whenever desired by bathing the film in a weak sodium carbonate solution and reapplying if desirable. Two types of lacquer are available for either wick or bead (roller) application.

Colour Photography.—A large amount of development work was carried on during the year 1940 by Technicolor corporation, with a view to using single film cameras in the production of three-colour motion pictures.

SCENE from the "Nutcracker Suite" sequence of *Fantasia*, a unique full-length production of 1940 in which Walt Disney's animated drawings are accompanied by "dimensional" music conducted by Leopold Stokowski

The Dunningcolor corporation, of Hollywood, Calif., announced that its subtractive method of making three-colour motion picture prints by photographic means was commercially available for the production of prints directly from any standard three-colour separated negatives onto a double emulsion coated projection positive.

Motion Picture Lighting.—Development work in this field, particularly with reference to fluorescent lighting, went steadily forward with continuous minor improvements.

Sound.—The year witnessed the first public demonstrations of stereophonic recording and reproduction of speech and music from film sound track. This form of recording and reproduction of sound attempts, through the use of multiple recording and reproducing equipments, to so re-create the recorded sound that the listener is conscious of the spatial distribution of the original sources of the sound. The equipment employed for these demonstrations was developed by the Bell Telephone laboratories and demonstrated to the motion picture industry in New York city and in Hollywood by Electrical Research Products Inc. This equipment is capable of reproducing a range of sound intensities equivalent to that of a full orchestra without perceptible distortion or masking of the weakest sounds due to film background noise.

RCA Manufacturing Company, Inc., together with Walt Disney, developed its system called "Fantasound" and employed it first in the production and exhibition of the Walt Disney feature-length production *Fantasia*. This system, in order to obtain a stereophonic effect in the reproduction of sound-on-film, and to carry a spatial distribution of the reproduced sound, as represented on the pictorial screen, uses a separate film with three sound tracks and a control track in addition to the film which carries the picture. The control track of the auxiliary film employs three carrier frequencies (one for each of the three sound tracks on the films). The material reproduced from each of the three sound tracks is separately amplified and fed to the individual loud-speakers, which may be located at any part of the theatre from where it is desired to direct the sound.

The control track method of securing a simpler though very effective dramatic aid in the reproduction of sound motion pictures, which differs from the two stereophonic systems mentioned above, was developed by the Photophone Division of RCA Manufacturing company and demonstrated to the public as "Vitasound" by Warner Bros. Pictures, Inc., with the showing of *Four Mothers* at the Hollywood theatre, in Hollywood, Calif., on Dec. 17, 1940, and with the showing of *Santa Fe Trail* at the Strand theatre, New York, about the same time.

This equipment utilizes a control track printed on one side of the film in the sprocket hole area to control the amplification of the theatre reproducing system and the number of speaker systems in operation at any given instant of time. Music and dialogue in all normal scenes of a motion picture are reproduced with the normal amplification, and those scenes and musical passages, whose dramatic value is enhanced by high levels of reproduction, receive, through the automatic action of the control track, greater than normal amplification, and are so reproduced through the normal speaker system and the auxiliary loud speakers located on either or both sides of the normal speaker system.

The addition of auxiliary loud speakers causes a broadening of the source of sound in the theatre, and from a dramatic standpoint is much more effective than any increase in loudness from the normal speaker system.

This RCA control track system is (1940) in process of standardization by the research council of the Academy of Motion Picture Arts and Sciences and allows for many variations, at minimum cost, as it may be operated so that only the main or centre set of speakers behind the screen alone is operating, or the auxiliary speakers alone may be operated, or a combination of the main and auxiliary speakers may be automatically operated. The over-all system amplification may be increased or reduced automatically by predetermined printing of the control track.

During the year 1940, the Metro-Goldwyn-Mayer sound department introduced the employment of mercury-vapour type exciting lamps in its recording machines employed for recording release negatives. The temperature at which these lamps operate satisfactorily is rather critical, and the following novel method of temperature control has been employed with great success:

The glass tube surrounding the mercury vapour capillary tube is open both ends so that a stream of cooling air can be passed over the capillary. The series-wound blower motor is electrically connected across the terminals of the mercury vapour lamp. As the temperature of the lamp rises, the voltage drop across the lamp increases and causes the blower motor to operate at increased speed, thereby increasing the rate of lamp cooling. Conversely, when the lamp temperature drops, the voltage drop across the lamp decreases, causing reduced blower speed and a lower rate of cooling.

The discovery of a type of selective frequency distortion in recording annals employing electronic volume compressors resulted in a basic modification of the compressor control circuits by the sound department of Warner Bros. studios. The operation of the modified electronic compressors is such as to remove all of the excessive sibilants previously present in circuits employing compressors to restrict the volume range of recordings.

Projection.—A new light source which is supplied with power by a power it radically different from those conventional types which have been in use many years made its appearance during the year 1940. Particularly adapted to medium and small theatres where moderate size screens are desired this new light source is capable of projecting pictures of unusual clarity and colour definition at a surprisingly low operating cost.

One of the outstanding features of the new projection system is the power conversion equipment, which instead of converting the current from alternating to direct, merely changes it from alternating current of one frequency to alternating current of a higher frequency. This light source is a development of Clarence S. Ashcraft and is referred to as "Cyclex." (See also PHOTOGRAPHY.) (N. LN.)

Moton, Robert Russa (1867–1940), U.S. Negro educator, was born Aug. 26 of parents who had been slaves in Amelia county, Virginia. He was educated at Hampton institute and on graduation was persuaded to remain as a teacher. He taught at Hampton for 26 years, and in 1915 he was selected as the successor of Booker T. Washington as principal of Tuskegee institute. He retired in 1935 because of ill health and was made president emeritus. Active in promoting the welfare of S. Negroes, he was honoured by several colleges which gave him honorary degrees. He was the author of several books, including an autobiography, *Finding a Way Out* (1920). He died in Capasie, Va., May 31.

Motor-Boat Racing. By the end of the U.S. season 27 new marks had been set in the various board classes and 17 in the outboard-powered division.

Although breakdowns prevented her capturing more than one of the three major trophies for which she competed, the new Gold cup hydroplane "Notre Dame" was the year's outstanding boat. It was designed and driven by young Daniel Arena for Herbert Hendelson of Detroit. In both the 90-mile Gold cup contest at Northport, Long Island, and at the Red Bank, N.J. National Veepstakes championship, "Notre Dame" managed to finish in only one heat. In the latter contest, however, she set new standards for lap and heat of 76.923 and 76.140 m.p.h. respectively, the best competitive time ever made by a Gold cup boat. "Notre Dame" later won the President's cup at Washington at a comparatively leisurely pace and then brought her activities to a fitting climax by setting a new international 12-litre mark for one mile of 20.987 m.p.h.

Victory in the famous Gold cup classic went to Sidney Allen's "Totsy Totsy III" representing the Montauk Yacht club when all the newer, faster boats suffered breakdowns.

The 225 cu.in. hydroplanes were again pre-eminent in the inland racing field with the principal honours divided. When his "Totsy III" was at her best the veteran Jack Cooper was virtually unbeatable and he took the greatest number of first places in important events, as well as setting new world speed marks. Thomas Hatfield's "Viper III," however, took the honours for consistency and David Foreman, driving Chauncey Hamlin's "Voodoo," set a new one-mile standard of 88.786 m.p.h.

Motor Cars: see MOTOR VEHICLES.

Motor Racing: see AUTOMOBILE RACING.

Motor Transportation. Commercial highway transport is America's fastest growing form of public transportation. This applies equally to motor bus passenger operation, and to motor truck freight operation, each of which represents a separate industry in itself.

Buses.—In the motor bus field two main operating groups are involved. These are companies offering intercity or long-haul service, and those engaged in purely local service within the limits of a single city and its adjoining suburban areas. Intercity carriers, in turn, group roughly into companies operating within the boundaries of one state, known as intrastate carriers, and those crossing state boundaries, known as interstate carriers.

All types of motor bus companies are closely regulated, either by state, federal or municipal agencies, and in some cases by all three. Interstate highway carriers have been under federal regulation since 1935. The Motor Carrier bureau charged with this regulatory responsibility is a division of the Interstate Commerce commission and governs both motor bus and motor truck operation that is of an interstate character. Intrastate carriers, those operating solely within the boundaries of a state, have long been under the regulation of their respective state governments. In both types of regulations the fundamental provisions are similar and, in general, consist of rules governing insurance requirements, measures designed to promote safety on the highways, a standard accounting classification, the filing of tariffs and compliance with the rates filed in those tariffs. City or local carriers usually are regulated in a somewhat similar manner by the governing bodies of the cities or municipalities in which they operate.

The motor bus industry represents an investment of more than \$1,000,000,000, including \$646,600,000 for rolling stock and \$238,000,000 for terminals, garages and maintenance equipment. Annual taxes directly assignable to operation total close to \$44,219,000 annually, not including state and federal income taxes and excess profit taxes. The actual size of the industry is indicated by the following figures from the latest census.

At the close of 1940 there were 3,478 bus operating companies in the United States. Of these, 750 companies were operating in city service, 2,308 in intercity and long-haul service and 420 in sightseeing and charter hire services. These companies jointly owned 54,000 buses, divided 33,550 in city and suburban service, 18,000 in intercity and long-haul service and 2,450 in sightseeing and other types of common carrier service. Jointly they operated over 343,300 mi. of highway, of which 28,300 mi. was in city service and 315,000 mi. in intercity and long-haul service.

Motor bus revenue for 1940 amounted to \$436,196,000, divided \$255,649,000 for city carriers, \$172,047,000 for intercity carriers and \$8,500,000 for sightseeing and miscellaneous operation. Passengers carried by buses in 1940 reached the astounding total of 3,986,837,000. Of these, 3,633,248,000 were city passengers, 350,089,000 were intercity passengers, including sightseeing and charter hire.

One of the most interesting trends was the gradual change-over from railway to bus operation in cities. The records show that over 600 cities in the United States, having a population of more than 10,000, were served in 1940 entirely by buses. (There are less than 1,100 cities in this population group.) The electric railways and their subsidiaries had approximately 19,250 buses. The steam railroads also went in heavily for motor bus operation. Fifty-two railroads owned 1,775 buses, while in addition, many steam railroad companies held substantial stock ownership in motor bus operating companies and thus were directly interested in motor bus transportation.

Still another phase of motor bus operation is represented by the school bus field. While school bus operation is not a source

of large revenue—since much of the equipment is school-owned and the balance operated under relatively low-priced contracts—it does represent a highly important phase of the nation's educational system. Approximately 44,250 schools used buses in 1940 to carry pupils to and from their classes, utilizing a total of 87,300 buses. In the neighbourhood of 3,750,000 children were carried daily in this service, at an annual cost to the schools of \$76,053,000. There were approximately 1,270,000 mi. of school bus route.

Trucks.—In size the motor truck field far exceeds the bus field, and there are many ramifications as to the types of service operated. Trucks are used not only by cartage companies in cities and by long distance haulers, but by private businesses as a part of their service to customers. The latest census by the Automobile Manufacturers' association shows, for instance, that in 1939 there were 997,033 trucks on farms alone. Registrations for 1939 showed that 4,320,829 trucks of all types were licensed during that year. For 1940 the estimated registration was 4,650,000.

The large truck fleets are owned mostly by private shippers. On June 1, 1939 the Bell Telephone company, for instance, operated 16,210 trucks; Standard Oil of New Jersey, 12,000; the Railway Express agency, 9,960. According to compilations of the Automobile Manufacturers' association 31 private companies operate more than 1,000 trucks apiece, while approximately 1,000 companies operate truck fleets ranging all the way from 100 to 1,000 trucks apiece. These figures do not include tractors, trailers or cars owned by these companies. In 1939 there were 1,180,411 trailers registered in the U.S.

Railroad use of motor trucks is rapidly expanding. In 1925 a total of only 900 trucks were used in railroad service. By the end of 1939 this had grown to approximately 65,500 trucks in railroad use. This includes terminal transfer service, intercity service, and store-door delivery. Another 230,375 motor trucks are owned by federal, state and local governmental departments. A highly significant sidelight on the use of motor trucks was offered by a study of the U.S. bureau of public roads which in May 1939 reported that 80% of all trips by motor truck are under 20 mi. in length. According to another government survey 60% of all common carrier truckers travel less than 100 mi. per trip.

The trucking industry gave employment to more than 3,650,000 drivers in 1940, with an uncounted number of freight handlers, mechanics, and helpers. It is closely regulated in every state as to sizes, weights, speeds, and must conform with innumerable other regulations both state and federal. It pays annually over \$400,000,000 in special truck taxes over and above all regular levies on business, property and income. In 1940 it served 48,000 communities not reached by the railroads. (C. W. S.)

UNDERFLOOR POWER and underseat baggage compartments are features of this new 29-passenger motor coach

Table I.—Distribution of Motor Truck Fleets by Industries
(Source: Chilton Company)

As of February, 1941	Fleets of 8 or More Trucks	
	Fleets Number	Trucks Number
Bakeries, Candies, Florists	1,485	62,342
Bottlers, Breweries	930	24,046
Coal Dealers, Mineral Mines	1,041	18,297
Contractors, Builders	2,457	50,775
Dairy Products, Milk, Ice Cream	1,485	62,553
Department Stores, Furniture	417	11,020
Express, Hauling, Inter & Intra State	5,301	176,313
Flour, Feed, Grains	140	5,433
Government, State, County, Municipal	2,060	239,002
Ice Dealers, Manufacturers	575	15,011
Laundries, Cleaners, Dyers	1,550	34,766
Manufacturers, Steel Mills	837	15,024
Meats, Fish	670	17,480
Newspapers, Publishers	137	4,888
Oil, Gasoline, Greases	1,224	75,045
Paints, Chemicals, Drugs	170	3,723
Public Utilities, Railroads	1,210	79,545
Vegetables, Farmers, Chain Stores	1,517	39,709
Miscellaneous	1,050	23,851
Totals	24,271	958,492

These fleets operate, in addition, over 500,000 passenger cars.

Other Countries.—No figures of the motor cars registered in most of the principal countries at the close of 1939 being available, the figures for the beginning of that year are given in Table II.

Table II.—Motor Vehicle Registrations, Exclusive of U.S., in 1938

Country	Private Cars '000's	Trucks '000's	Total '000's
United Kingdom	1,916	626	2,542
France	1,750	500	2,250
Germany	1,306	402	1,708
Canada	1,161	220	1,381
Australia	552	252	804
U.S.S.R.	85	593	678
Italy	303	86	389
Union of South Africa	294	45	339

Even if figures were available, they would be very misleading. The year 1940 opened with motor transportation reduced, except for military purposes in all countries actively engaged in war. The spreading of the war and the effectiveness of the British blockade resulted in an extension of the reduction, until it can be said that no European country was unaffected. The extent of the reduction was variable in quantity, but the fall was rarely less than 50% and more often greater, as the vehicles still in operation were running a smaller mileage in a year. Many countries outside Europe were affected, so in the old world a reduction was universal. Nor had the increase in military transport made good the reduction in the private and commercial fields. The diversity of the traffic generally on the roads declined.

The standard of public service on the roads was changed. The services were fewer and ran with less frequency; there was a much closer adjustment of service to the actual traffic. While this meant fewer vacant seats and less unutilized space, it also meant more overcrowding and more overloading. Fares and rates rose following a rise in costs. All this had an effect on the division of traffic between rail and road. The division though was not on merits, but mainly determined by circumstances of place and time, and governmental control; so it was doubtful whether the experience would do much towards solving the problem of the division of function in peacetime. It was, however, made clear that no country can afford to let its railways decay as the result of road competition. It also demonstrated the great advantage of having alternative means of transport, as even in war both are unlikely to be put out of commission at the same time.

The problem of safety on the road still confronted the world unsolved. In spite of the large reduction in the use of the roads, such figures as were available indicated that the deaths and injuries from accidents had fallen little from the level of the pre-war months of 1939. In countries actually at war there were special reasons for this. The restrictions of lighting on account of either attacks by air or the fear of them were no doubt a predominant cause, but many persons were driving on the road not fully qualified because of the relaxation or abandonment of tests for drivers. (See also RAILROADS.) (W. T. St.)

Motor Trucks: see MOTOR TRANSPORTATION; MOTOR VEHICLES.

Motor Vehicles. The 1941 models in the U.S. were formally announced to the public at the automobile shows in Oct. 1940. The effect of the preparedness program did not affect the 1941 models because most of the tooling and manufacturing setup was completed before the defence work started. During the latter part of 1940 the national defence work was under way and all of the automobile producers were working on government orders. Various companies were building plants and

Below, left: 1941 CHEVROLET five-passenger coupe

Below, right: DUAL CARBURETTORS of the 1941 Buick "Fireball" engine

Right: THE PACKARD of 1941 was further streamlined, but kept its traditional radiator design

Below, left: THE 1941 LINCOLN CONTINENTAL had a marked European appearance

Below, right: SAFETY WHEEL RIMS appeared on all 1941 Chrysler models. This rim keeps tires firmly in place, even after blow-outs

setting up machine tools for making trucks, aeroplane engines, boat and submarine diesel engines, tanks, machine guns, cartridges and many other things necessary for the rearmament program. The automobile industry will reach the high production stage on this work sometime during 1941. At the close of the year 1940 the preliminary work was well under way and efforts were being made to speed up the production. A number of executives from the automobile industry were directing various phases of this work for the government. William S. Knudsen, director of the Office of Production Management, was the leading automotive executive chosen for government work.

In 1940 motor vehicle production again showed an increase over the previous year. Factory sales were 4,285,000, an increase of 19.5%. Motor vehicle registration in the United States was 31,950,000, which was 69% of the total world registration. Exports amounted to but 6% of production, due to the closing of many foreign markets by the war. Employment in auto, body and parts factories was 443,000.

The 1940 traffic accident rate showed an increase of 6% over that of the year 1939. The increase in accidents was due to the increase in travel and the mileage rates were only slightly higher than the 1939 rate. Best estimates place motor vehicle fatalities at 34,400 for 1940.

Passenger Car Bodies.—The outside appearance of the new models continued the trend set several years ago with wider seats, longer bodies, more glass area and stiffer construction. Hoods were more often locked from the driver's seat. Either concealed, running boards or no running boards were used on most bodies. Direction signals were made available on more models. One new model had a unit frame and body construction.

Many changes and additions were made to the interior appointments. Improvements in heaters and ventilators were general. An air cooling system was continued by one manufacturer. Power operated windows were featured on one model. Windows were raised and lowered by hydraulic pistons controlled by a push button in the arm rests. More pounds of plastics were used, especially on the dash.

Chassis.—Many changes and innovations appeared on the 1941 chassis. Frames were redesigned to carry the heavier bodies and to permit lower cars. One new type independent front wheel suspension was introduced and additional models used coil springs in the rear. A safety rim was used on one line of products so that flat tires would not be thrown off the rim at high speeds. A ball bearing worm and nut steering gear was adopted on several lines to reduce steering effort. Synthetic rubber tires were introduced as replacement equipment. The successful development of synthetic rubber for tires eliminated one more strategic material from the list of products in which America is dependent upon a foreign source of supply. While these were not used as standard equipment, the industry was interested in this alternate source of such a fundamental product.

Transmissions.—Transmissions incorporating a fluid clutch unit were made standard equipment on additional models. Several automatic and semi-automatic transmissions using a fluid coupling were being used. All of these devices eliminated much of the gear shifting and one completely eliminated the clutch pedal. Other devices were developed to simplify gear shifting. Vacuum-controlled clutches and gearshifts were standard on many lines and automatic overdrives were continued on many others. A combination of a four-speed transmission with a friction clutch and a fluid drive unit was used on one model. In 1940, the greatest interest in mechanical features seemed to centre around the transmission. Automatic transmissions not only simplified the operation of the automobile but, with many of the new devices, they added to the performance and economy as well.

Statistics of the Automobile Industry
1940 Calendar Year

Production and Value

Car and truck factory sales, from U.S. plants	4,476,000
Passenger Cars	3,795,000
Motor Trucks	771,000
Percentage increase over 1939. Motor Vehicles	25%
Wholesale value of cars, from U.S. plants	\$2,413,800,000
Wholesale value of trucks, from U.S. plants	\$ 598,300,000
Wholesale value of cars and trucks combined	\$3,012,100,000
Wholesale value of parts, accessories and tires for replacement, and service equipment	\$1,250,000,000
Motor vehicles, accessories, service equipment and replacements of parts and tires	\$4,262,100,000

Registration

Motor vehicles registered in U.S.	31,950,000
Motor Cars	27,300,000
Motor Trucks	4,650,000
Per cent of new vehicles sold in U.S. required for replacement of vehicles scrapped (average 1930-40)	84%
World registration of motor vehicles	47,000,000
Per cent of World's automobiles in U.S.	69%

Taxes

Total motor vehicle user taxes	\$1,772,000,000
Gasoline taxes, federal, state and municipal	\$1,120,000,000
Percentage motor user taxes to all taxes from all sources, federal, state and local	11%

Foreign Sales

Number of motor vehicles exported from United States	230,500
Per cent of U.S. production exported	5.1%
Value of motor vehicles, parts and tires, exported from U.S.	\$280,000,000

Employment

Employment in auto, auto body and parts factories	443,000
Weekly payroll, wages	\$15,400,000

Motor Vehicle Retail Business

Total car and truck dealers	41,494
Total repair shops	87,366
Total retail outlets, duplications eliminated	94,985
Wholesalers	6,204
Retail gasoline outlets	400,000

Automobile's Relation to Other Business

Automotive industry is the largest purchaser of gasoline, rubber, steel, malleable iron, lubricating oil, plate glass, nickel and lead.	
Railroad carloads of automotive freight shipped	3,755,000

Used in Automobile Industry

Rubber	80%
Steel	17%
Lumber, hardwood	4.5%
Copper	13%
Lead	34%
Zinc	11%
Tin	12%
Aluminium	10%
Nickel	23%
Gasoline	90%
Gasoline used by motor vehicles (gallons)	22,044,128,000

Motor Vehicle Use

Number of communities served only by motor vehicles	48,000
Number of children carried to school daily by buses	3,750,000
Mileage of rural highways used by U.S. Post Office Department for delivery of mail	1,392,657
Per cent of motor vehicles on farms and in villages under 2,500 population	41%
Per cent of trucks privately owned and operated	86%
Per cent of live stock hauled to market by truck	53%

Motor Trucks and Buses

Motor trucks in use	4,650,000
Total special motor truck taxes	\$460,000,000
Taxes per dollar of gross revenue, for-hire trucks	6.8c
Number of bus and truck drivers	3,900,000
Motor buses in use	144,000

Engines.—Power outputs of most engines were increased to take care of the increased size and weight of the automobile. Hi-

tane fuels of as much as 80 octane number were made available to the petroleum industry. This allowed the use of compression ratios as high as 7.25 to 1. Small car engines produced a maximum of about 85 h.p. and larger engines up to 165 h.p. This higher output was made possible by many design changes in valves, cooling, pistons, combustion chambers and spark plugs. A new type bearing in which a porous matrix on a steel back is filled with a soft bearing material was introduced on one model. A dual carburettor fuel system was developed for one line of cars. Economy and power output were thus increased.

Interchangeable engines were introduced. In several models, either a six- or an eight-cylinder engine can be fitted to the same chassis. Instead of two lines of cars, these manufacturers have two lines of engines to fit one line of bodies. (See also GASOLINE.) (C. F. KE.)

Motta, Giuseppe (1871–1940), Swiss statesman and scholar, was born in Airolo, Switzerland, Dec. 29. He attended the universities of Fribourg, Munich and Heidelberg and received the degree of doctor of law at the age of 22. He began the practice of his profession at Airolo, and soon interested himself in politics. He was elected to the national council in 1899, was chosen president of Switzerland in 1915 and was re-elected four times, the last time in 1937. He was president when the League of Nations held its first session at Geneva and was made honorary president of the league. When he died at Berne, Jan. 23, he was serving as chief of the Swiss political department.

Mount Holyoke College, pioneer American institution for women founded in 1837 by Mary Lyon and situated at South Hadley, Mass. The campus covers 270 ac. with over 70 buildings. Registration figures for the 1940–41 session included 1,027 undergraduates and 64 graduate students, a total of 1,091. The teaching faculty numbered 131; the endowment fund as of June 1940 was \$346,489; the total college income for 1939 was \$1,321,086. Gifts received during the year 1939–40 amounted to \$118,556.

Muck, Karl (1859–1940), German musician noted as the interpreter of Wagnerian music at the Bayreuth Festival, was born in Bavaria, Oct. 22, the son of a councillor in the Bavarian government. He displayed musical ability at an early age and when he was 11 he made his debut as a pianist at a chamber music concert. He later played the violin in a symphony orchestra. He entered the University of Heidelberg at the age of 17 and the next year transferred to the University of Leipzig to study philosophy and classical philology, while he was perfecting his musical education at the Leipzig conservatory. At the age of 22 he received his doctor's degree from the university and appeared as a solo pianist at a concert. He thereafter devoted himself entirely to music, becoming in the course of time the conductor of the Berlin Royal Opera. He went to the United States in 1906 as conductor of the Boston Symphony orchestra, a post he held until 1908. He was recalled to Boston in 1912 and conducted the orchestra again until 1918. When the United States entered the World War in 1917 he refused to lead the orchestra in "The Star Spangled Banner," and was interned as an enemy alien. After the war he was released and returned to Germany. Chancellor Brüning conferred the Order of the German Eagle on him in 1933. He died in Stuttgart, March 4.

Municipal Government. U.S. municipal government toward the close of 1940 met the first impact of the national defence program. While every local government service was potentially involved, civil defence, housing, personnel, planning and finance were first affected. But even here it can hardly be said that the new local programs assumed definite shape. However, the trends were clearly indicated in line with the national defence needs.

Defence Developments.—To facilitate co-ordination between the federal, state, and local governmental levels, the advisory commission to the council of national defence set up a division of state and local co-operation in Aug. 1940. The division serves as a channel of communication and of planning between governmental agencies and particularly between the national, state and local defence councils. By the end of the year, defence councils or co-ordinators were established in about 36 states and 700 municipalities, including cities and counties. New York state alone had more than 60 official local defence councils.

Plans for the emergency mobilization of state and local police forces for civil defence emerged in a number of states. The police resources of the state, most of which are city policemen and their equipment, were organized into potential mobilization areas under the direct control of the governor. New York state assumed the lead in this development, and several additional states, notably Virginia and New Jersey, followed the general outline of the New York plan.

A considerable number of states and municipalities made provision for their employees who are called into military service. Only a few cities made plans to encourage military service by paying the salary differential between civil and military compensation, as was done so frequently in 1917. A number of city ordinances provide, however, for the reinstatement of employees on their return and some specifically preserve their vacation, sick leave, promotion or retirement privileges.

Selective service boards were organized under the Selective Service law throughout the nation in Oct. 1940. In the cities, the personnel of the draft boards was generally nominated by the mayor, and schools or other public offices were furnished for their meetings. Registration was handled through the regular local election machinery.

Deaths from traffic accidents throughout the year showed a definite increase over those for 1939, reversing the trend of previous years. There was an increase also in most of the more serious crimes over the earlier part of the year compared with the same period of the preceding year, notably in negligent manslaughter (traffic accidents), larceny and aggravated assault. Robberies decreased over the same period.

Housing.—Local housing authorities have been authorized in at least 38 states. There were 507 such authorities, 203 of which were county authorities, as of Nov. 1, 1940; there were but 46 on Nov. 1, 1937. By the middle of Dec. 1940, 335 housing projects were reported as either under construction or completed, a gain of approximately 200 during the year. Of these, more than 100 were partially or completely occupied. For the purpose of determining actual housing needs in the defence program, a defence housing co-ordinator was set up in the national defence advisory commission, and the president, on the recommendation of the housing co-ordinator, approved immediate construction of housing projects in 63 vital defence areas spread over 28 states and territories, to provide for increases in army, navy and industrial personnel. Funds were appropriated to several federal agencies in aid of the defence housing program and the United States

Housing authority diverted part of its existing appropriation to local housing authorities specifically for defence housing needs. The first two defence housing projects were opened at Montgomery, Ala., and Pensacola, Fla., before the end of the year.

The 1940 Census.—The predicted decline in the rate of urban population growth was fully confirmed by the preliminary figures of the 1940 census. While the total urban population increased 7.9% for the decade 1930–1940, the rate of increase was less than one-third of the rate for the preceding decade, when the increase was 27.3%. Of the 92 cities whose population exceeds 100,000 in 1940, 28 or almost one-third declined in population during the past decade, whereas but four of them experienced a decline between 1920 and 1930. Of the 313 cities with a population between 25,000 and 100,000, 76 experienced a decrease since 1930, and of the 663 cities with a population from 10,000 to 25,000, 157 showed a loss. Miami, San Diego and Washington showed the biggest percentage increases among the larger cities, while the northern industrial cities showed the least rapid growth. The available data indicated that in the metropolitan areas the outlying suburbs continued to increase their population but at a much slower pace than in the prior decade. (See also CENSUS, 1940.)

Problems of Declining Cities.—The revelations of the census figures pose questions of serious import to the cities. On the basis of a ten-year survey covering the years 1930–1940, it appears that cities with a declining population had increased their tax rate twice as much as the growing cities, while their assessed valuations had declined to a greater extent. In the metropolitan centres, land use and land values have been seriously affected by the migration of population to the outlying suburbs, either within or without the city limits, leaving to the central city baffling problems of tax delinquency, reduced valuations, and increased tax burdens in either case. Apparently the United States' 200-year urban land boom was over by 1940.

Finance.—On the whole, the bonded indebtedness of cities declined. New municipal borrowing increased sharply toward the close of the year, however, due in part to the desire to take advantage of the favourable bond market and in part to fear of removal of the tax exempt feature of municipal bonds by the next congress. New York city indulged in particularly heavy borrowing, due largely to transit unification under city management.

Municipal debt defaults decreased in number by about 200 between Dec. 1939 and Dec. 1940. Wider adoption of long-term budgeting programs was in evidence, directly encouraged by the National Resources Planning board. Local governmental expenditures reached a new high in 1940 and local tax collections maintained their upward trend. The improved condition in municipal tax delinquency continued. In New York city, only 8.7% of the property tax levy remained uncollected at the close of the fiscal year—its best record in a generation. The municipal bond market was marked by an extraordinary resiliency. The index of average yields for 20 large cities dropped to 2.18% on Dec. 1, 1940—an all-time low. Commodity prices paid by the cities declined gradually until August when a moderate upturn commenced, which was accelerated, however, in the closing weeks of the year.

Relief.—Relief loads began to drop significantly in the latter part of 1940. In the heavy industry centres with early war and defence contracts the first labour shortages appeared. But even in New York city the relief load decreased to about one-half of the total at the high point in Oct. 1935. During 1940 there was a gradual reduction totalling about 7% in the urban WPA employment rolls. In Dec. 1940, there were in New York city 128,000 families on regular home relief, and 103,000 on WPA as compared with 149,000 and 110,000, respectively, in Jan. 1939. A significant factor was the development of a considerable turn-

over of both WPA and home relief clients. A study of the heads of families on relief in Pittsfield, Mass., showed that 42% were in bad health; 79% had never entered high school; 33% were broken families; 50% were over 65 years old; and 66% were labourers.

New York City.—In the country's largest municipality, one of the outstanding events of the year was the retention by popular vote of the proportional system of voting for the members of the city council. This was the third successive time the voters had expressed themselves affirmatively on this issue. The city also completed unification of its rapid transit lines under municipal ownership and operation after 20 years of effort, and concluded the construction of a new subway—probably its last. The City Planning commission, after three years' preparation, presented an elaborate 50-year land use plan for the development of the city of the future on a comprehensive scale, with due regard to the fact that the city had about reached the limits of its population growth. The popular movement for the abolition of some of the superfluous county offices still saddled on the city taxpayers ended abruptly when the initiative petitions were invalidated by the courts.

City Manager Plan.—Eighteen municipalities in the United States adopted council-manager government in 1940. The plan was in effect in a total of 493 cities and counties of the country on Dec. 31, 1940. In two instances the plan was abandoned. A striking victory for the plan, as well as for proportional representation, was won in Cambridge, Mass. The year was marked also by publication of a survey and evaluation of the city manager plan in 50 cities, conducted under the auspices of the Committee on Public Administration of the Social Science Research Council (L. Gu.)

Munitions of War. Man does not live by bread alone, nor do armies win by munitions alone. That nation which would impose its will upon another, or resist such imposition, must possess munitions not only in stupendous quantity, but of excellent quality, latest design, and operated by corps upon corps of super specialists. These requirements satisfied, and buttressed with a sufficiency of man power, adequate morale, the combination becomes well nigh unbeatable.

In the fall of 1939, and throughout 1940, the German military machine met these requirements, while every object of its ruthlessness proved lacking in one or more. All were inferior in power, whereas air superiority was a *sine qua non* to success. Likewise soon became apparent that no contestant could gain, at least, hold, vital objectives unless possessed of tanks, in numbers almost limitless. France boasted thousands, but mostly of World War vintage. Unable to steel itself to the financial sacrifice attendant to their replacement with others of modern design, France pattered along with what it had. Britain was almost equally lacking in the foresight necessary to the junking of obsolete equipment, or to the adequate production of new and better types. Though making a magnificent gesture at rearmament, remained a gesture only. Came the Day of Judgment, and the swastika floated over Paris. But for the providential existence of the English channel, it would have waved over London as well.

What miraculous properties were to be found in the munitions of 1940 as against those of 1939—of 1914–18? None. In the weapons themselves there was little new or startling. It was their mass employment that the revolutionary appeared. In contrast with the homoeopathic pilules in which formerly administered, force was now applied in heroic doses. An objective against which in 1918 an infantry attack would have been implemented perhaps a score of tanks and as many aeroplanes, to succeed or fail after hours of bloody stalemate, with unnumbered casualties.

on both sides, was in 1940 overwhelmed in a matter of minutes by literally hundreds of bombing planes, followed by as many tanks, almost without loss to the attacker.

Two facts stand out, the first of which has already been suggested, to wit: the modern campaign is increasingly three-dimensional, rendered so by the perfection of the aeroplane. The second, based upon the wider realization that munitions power is as important as man power, if not more so, is that the campaign is no longer conducted solely against the armed forces of an opponent; it is directed at every material resource, immediate or remote, animate or inanimate, armed or unarmed, which that opponent can muster in a military effort, for "munitions" possess an all-inclusive connotation. Participants in the War of 1914-18 thought that they were engaged in such a conflict. Those aligned against one another in the contest of 1940 *knew* that they were. With this in mind, one may examine the actual instrumentalities employed, remaining ever alive however to the fact, already accented, that the characteristics of the weapons involved are of far less import than the quantities in which available or the skill with which applied.

Air Offence.—Western Europe awakened on May 10, 1940 to the fact that lightning war, with screaming death raining from above, the threat of which Germany had so often used to wring concessions from nations all too conscious of their military deficiencies, was something more than an unpleasant dream. And despite the lessons of Poland, where identical tactics had been employed, if in lesser degree, its peoples proved wholly unprepared to stem the tides that surged upon them from air and land. Credible reports indicate that, between May 10 and 13, 900 Allied planes were destroyed, two-thirds of these while yet upon the ground. In the air, casualties were so fearfully high (the British on May 14 were said to have lost 40 of 95 bombers detailed to a single mission) that France and Britain soon ceased all attempts at daylight bombing. Germany, outnumbering the combined Allied air forces in the proportion of three to two, and more (Britain did not dare throw her full strength into the contest, lest she leave her own nerve centres unprotected); and enjoying a unity of command which her opponents ever lacked, gave short shrift to the modest fleets of Holland (200 ships), Belgium (400) and France (1,200). And, as an example of what could happen to those who defied German will, Germany razed in two short hours (12 noon to 2 P.M., May 14), in a succession of intensive assaults by massed flights of bombers, no less than 26,000 buildings in the city of Rotterdam, a metropolis of 600,000, this after the Dutch commander had made the official signal of surrender. (The attendant loss of life, confined principally to the civilian populace, was estimated at 25,000.) Closer to the frontiers, thoughtful German aviators directed their missiles not at road surfaces, but slightly to one side. Providing the aim was accurate, damage to hostile forces was in no wise lessened, and the highways remained intact for early use by their own onrushing mechanized organizations.

For the most part, no great differences existed in the matériel employed by the several contestants. British fighter planes, chiefly Hurricanes and Spitfires (two new types, the Whirlwind and the Tornado came into service just as 1940 ended) possessed approximately the same speed (337-365 m.p.h.) as Germany's Heinkels and Messerschmitts (358-365 m.p.h.), but were inferior in armament, mounting machine guns only, as against similar weapons augmented by 37 mm. cannon, which the Messerschmitts possessed. This installation upon aeroplanes of ordnance ever increasing in calibre rendered necessary the provision of at least some armour protection for the pilot and certain of the more vital parts of his ship. Likewise the huge volume of fire delivered by multiple machine guns (the Spitfire and Hurricane, with eight each, can discharge their weapons at the rate of 9,600 rounds a

minute) led to the hurried development, by all concerned, of self-sealing gas tanks, and provision for the installation of these in ships ordered for future delivery. In the U.S.A. there appeared such a tank with walls built up of a combination of synthetic resins and latex, the sealing properties of which, conferred by colloidal characteristics possessed by these constituents, functioned on a physical rather than a chemical basis, thus giving it superiority over those of chemical type in which the active agents, when called upon to seal punctures, invariably contaminate the gasoline within, with eventual deleterious effect upon the motor. Aviators' self-heating suits were another United States contribution to the armamentarium of the flyer. In these the rubber, converted from a non-conducting to a conducting agent by special treatment applied during its processing, will pass, but resist, a current. As a result, the entire substance of a garment so treated will, when electrically energized, give forth an even and continuous emission of radiant heat so long as a current of proper intensity passes through it.

Yet another advance, also of United States origin, was the supplanting, by a new system of illumination, of conventional methods of lighting aeroplane instruments. So-called "luminous" paint, which actually in its normal state lacks the power to emit light rays, but acquires this when activated by ultra-violet radiation directed upon it from suitable sources, is applied to the dials. When energized by the ultra-violet, it glows with a soft fluorescence, adequately illuminating all navigating devices, practically without eyestrain to the pilot.

In the sphere of the bomber, neither Germany nor Britain appeared to have developed ships equal in certain respects to the U.S. B-17 and B-24 "Flying Fortresses." These, powered by four 1,200-h.p. motors, develop a top speed of 250 m.p.h. (latest types would do 300), and can carry a bomb load of 4½-5 tons over a cruising range of 3,000-4,000 miles. All early models of these were, however, deficient in that they lacked a rear gun turret, and were thus vulnerable to attack from that quarter, a drawback which was being corrected in later specimens. British bombers consisted chiefly of Blenheims, Wellingtons, Hampdens and Lockheed-Hudsons, most of which were incapable of carrying more than a single ton of explosives over a prolonged flight. Against these were pitted the heavy Junkers 87, Germany's standard dive bomber, with a top speed of 242 m.p.h., carrying one 550- or 1,100-lb. bomb beneath the pilot and four 110-pdrs. in racks under the wings; the Junkers 88 and 96 and, largest of all (but at the same time one of the most vulnerable), the Dornier 17. In the lighter field Britain faced the Heinkel 118 and 120 and the Junkers 87B (known also as the "Stuka"), a single motor monoplane of superlative speed and effectiveness. Carrying a solitary bomb (in its nose) and aligning itself directly upon a target, it does not, like other "diving" ships, straighten out before releasing its missile, but lets this go an instant prior to terminating the dive, by which time it has approached perilously close to the object of attack. (The three Stukas which on June 17 destroyed the British liner "Lancastria," with the loss of 2,800 of those on board, the third of three waves of those which attacked the vessel, were all said to have plummeted into the sea within 200 yards of their victim.) So speedy and manoeuvrable that its twists and turns enabled it to defy the calculations of mechanical "predictors" (amazingly complex instruments employed for regulating automatically the aim of anti-aircraft artillery), it was the air marvel of the year, though for some reason best known to the German high command they were rarely employed against British targets during the last four months of 1940.

Other German bombers, however, suitably escorted by fighters in a ratio of some two to one or more, found such employment almost daily during the early summer and later, after massed day-

light raids, with their losses averaging 40% of assaulting ships, had proved too costly for constant indulgence almost nightly over London or other important objectives. And despite balloon barrages and the superhuman effort of the royal air force, casualty lists mounted steadily. Yet the attendant limitation to Britain's industrial productive capacity, the prime object of these assaults, was estimated at not over 5% to 10%.

Ringling the objective with smoke bombs by day or incendiaries by night, advance flights of fighters prepared the way for the bombers that followed. Estimates indicated that during the last three months of 1940 London was bashed by a total of some 100,000 bombs of all sizes and types. Of these about 50% were incendiaries, any one capable of initiating a devastating conflagration if not immediately quenched; 25% high explosive types weighing from 25 to 1,000 lb. and detonating on impact; 25% of the "time" variety, designed to explode at intervals of from a few minutes to 72 hours; and 5% "land mines," huge two-ton affairs which, floating to earth on parachutes, bore their explosive charges within relatively fragile containers wholly lacking in penetrative power, but exterminating by concussion all forms of life within their radius of action.

The widespread destruction upon the ground of defensive air matériel in the initial phases of a lightning attack led to hurried efforts toward the devising of satisfactory means of protection against similar sudden and devastating onslaughts in the future. The most effective of these, subterranean hangars, proved too expensive and time-consuming in construction to offer a complete solution to the problem. One suggestion emanating from the United States was that "flight strips" be established on public lands adjacent to and in conjunction with military highways. These, properly surfaced, would constitute runways 200 ft. in width and not less than 1,800 ft. long, and it appeared probable that the location of a sufficiency of such havens in suitable areas would offer relatively safe (because adequately dispersed) points upon which to base scattered units of friendly air forces.

Air Tactics.—The possibility of air-transported tanks figuring in the long deferred but ever imminent invasion of Britain, became real when Russia demonstrated experimentally the practicability of such a measure. The same nation had previously solved the problem of setting down planes on rough but relatively flat terrains in sub-freezing weather, by flooding these to a depth of a few inches, then landing its ships on the ice which soon formed. Infantry movement by air figured largely in Germany's invasion of Norway and the Low Countries, Germany having available for this purpose hordes of old Junkers transport planes, each capable of carrying 20 infantrymen with full equipment. Germany's wide employment of parachute troops at exactly the right times and places laid the groundwork for the capture of many airports and other strategically important points, and astonished a world whose memory was so short as to forget that the practicability of such measures, first demonstrated in the United States some ten years earlier, had been toyed with almost continuously by one or more of the great powers ever since. Credible reports have it that even troop-laden gliders, towed by aeroplanes and cast loose at the psychological moment, managed to manoeuvre to landings within the enclosures of certain Belgian fortresses, spewing out soldiers who, laden with tanks of ethylene (a gas which produces general anaesthesia) and arsenical smokes (nausea-inducing), emptied these into exposed ventilator ports, capitulation of the amazed and discomfited defenders speedily resulting.

Air Technology.—As in the past, ship speeds continued to increase, engine power ratings to advance, and the size, weight and carrying capacity of bomber types to be augmented. The United States placed substantial orders for the new Lockheed P-38 inter-

ceptor, a two-motored ship said to be capable of a top speed 400 m.p.h. or more, a cruising range of 1,100 mi., and of climbing to an altitude of a mile in four minutes. Another fast pursuit plane was the Grumman, with a speed equalling or exceeding that of the P-38. Armed with two 37 mm. cannon and four machine guns, both the U.S. army and navy were acquiring specimens of those for the former service being equipped with the Allison liquid-cooled engine of 1,090 h.p. This embodies a 12-cylinder power plant with two opposed banks of six cylinders mounted in conventional "V" formation and differing radically from the radial type of motor which is commonly air-cooled and exhibits one or two banks of cylinders disposed like the spokes of a wheel. This second type was much the more common, but the U.S. army air corps expressed full satisfaction with the performance of the "in line" type of motor with its liquid cooling system, and confirmed this by placing huge orders for combat planes in which power plants of this character were specified.

Anti-Aircraft.—Tendencies toward heavier and longer-ranged anti-aircraft cannon for use against high-flying planes, and for more mobile specimens with increased rates of fire in the smaller calibres, continued manifest. One result was the official adoption by the United States as its largest mobile anti-aircraft weapon of the 90-mm. (3.54-in.) piece which had long been under test. This, with its range of 36,000 ft., matched the 3.7-in. British A.A. cannon which had performed so creditably. Thus became relegated to secondary tasks the erstwhile pre-eminent 75-mm. (3-in.) gun with its 20,000-ft. range which, though able ten years earlier to interdict the passage of any bomber then known, was now impotent against those of 1940 which, flying at 300 m.p.h. or more, could register hits against area objectives 25,000–28,000 ft. below. Still larger calibres of anti-aircraft matériel were being employed on fixed mounts (105 mm. and over), while against low-flying planes, concentrated small arms fire, machine guns in .30 and .50 calibres and small cannon of 20-, 37- and 47-mm. bore proved effective upon occasion. Even so, records indicated that in the "Battle of Britain" not more than 3% to 5% of attacking planes had been brought down by anti-aircraft fire. Nevertheless the greatly increased accuracy of this type of weapon was well illustrated by the fact that Finland expended, in the brief war with Russia, exactly 54 anti-aircraft shells per aeroplane destroyed, while the figures for a comparable feat in 1914 were 11,000; in 1918, 6,000.

Balloon Barrage.—The balloon barrage continued to render effective service in the defence of London, though no attempt was made completely to encircle that city with such devices, since the number required for this would have been prohibitive. (To detect venturesome enemy aircraft from attempts to effect passage between their restraining cables, these must be spaced not over 300 ft. apart.) Further, they were useful only at night or when hidden by cloud banks, due to their ready visibility and high degree of vulnerability (being hydrogen filled) under good atmospheric conditions. The ultimate height to which they were released approximated 20,000 ft., though it was reported that certain French, Italian and German barrages managed, through the employment of tandem balloons, to ascend as high as 33,000 ft. (The maximum World War range was 8,000 ft., but at that period contemporary bombers were limited to a ceiling of 11,000 ft.) In rural areas, special defence workers crisscrossed with shallow trenches, calculated to bring swift disaster upon planes attempting to choose such a landing spot, any open level fields which they figured might prove tempting to the air forces of an invader. On the seas, merchant vessels discovered that by towing captive balloons aloft and astern they could make air attacks extremely hazardous from the rear by hostile dive bombers. Naval units, despite their anti-aircraft armament, suffered constantly under

the pounding of hostile air arms, many lesser vessels being disabled or even sunk, and certain heavier units heavily damaged, though no battleships were lost as a result of air bombing. Britain, in an effort to neutralize such attacks, incorporated at least two "anti-aircraft" vessels among her sea forces, and the United States navy, taking stock of happenings overseas, came to the conclusion that its fleet was decidedly lacking in anti-aircraft arms and armour, and requested a special appropriation of \$300,000,000 to remedy deficiencies.

Mechanization.—Second only in importance to their arms became the mechanized units of the various warring nations. The backbone of these were the tanks (light, medium, and heavy) which, when employed in sufficient numbers and with proper support (motorcycle units; motor-drawn infantry) close behind, proved almost invincible. As in the field of the aeroplane, the tank was steadily becoming more heavily armed and armoured, carrying in some instances guns of calibres up to 155 mm. (6 in.) and armour capable of sustaining hits by weapons of 75 mm. (3 in.) calibre. The United States was concentrating upon the development of a light tank of about 13 tons and a medium type of approximately 30 tons. And while lessons learned abroad were resulting in constantly changing specifications, late deliveries of a given model embodying characteristics not possessed by earlier specimens, the lighter variety was for the most part capable of a speed of 35–40 m.p.h., carried a crew of four, armament of four machine guns and one high-velocity 37-mm. cannon, possessed two-way radio facilities and had a mobility of 2,000 mi. (as against a weight of 7½ tons, speed of 4 m.p.h., crew of two, one .30-calibre machine gun or one low-velocity 37-mm. cannon, no radio and a 50-mi. mobility for its 1914–18 World War counterpart). Similarly, the medium type had a speed of 30 m.p.h. or better, crew of six, one high-velocity 37-mm. gun and eight machine guns, two-way radio and comparable mobility. Still a third (heavy) type of approximately 50 tons was projected, but its specifications were yet to take final form when 1940 ended. One outstanding improvement embodied in the 1940 product involved the replacement of all-steel track links with others of a new type wherein solid rubber blocks were cemented to steel treads, devices which by actual test proved to give eight times the mileage to be had from other types.

Another innovation, long awaited, was the introduction of the diesel motor, a certain proportion of the light tanks now being powered with engines of this type. And the General Motors corporation, foreseeing their wider employment, promptly commenced to manufacture two-cycle diesels of from four to 12 cylinders, designed for installation in tanks of all sizes and weights.

Special flame-throwing tanks said to be capable of projecting their fiery mixtures over ranges up to 100 yd. were reported to have figured prominently in the general German assault against her western neighbours which commenced on May 10, as were numbers of the huge 70-ton break-through types which Germany was credited with possessing. The preponderance of Germany's tank matériel, however, appears to have been made up of three varieties: a light, 6-ton model armed with two machine guns of 7.9 mm. calibre; a medium type of 12–15 tons with similar armament, augmented by a 37-mm. cannon; and a heavy type (20–25 tons) mounting two machine guns and a cannon of 75 mm. Recognizing the new significance of the tank and its associated vehicles, the United States undertook to incorporate in its military establishment what it chose to designate as an "armoured force," composed of mechanized units formerly parts of, but now detached from, the infantry and cavalry arms, its commanding general responsible to the head of neither of these, but directly to the chief of staff. And while tables of organization were constantly undergoing change, the fact remained that tank allocations to

tactical units reached in 1940 figures representing an increase of several hundred per cent over those formerly considered adequate. Another definite trend was toward an increased allotment of heavy weapons (machine guns, anti-tank guns and light mortars) to both infantry and cavalry organizations. One result rather startling in its implications was that the infantryman who, ever since the supersession centuries past of the pike by the firearm, had been first musketeer and later rifleman, relinquished probably for all time his traditional weapon. For by the end of 1940 two-thirds (during the World War, only one-fourth) of the enlisted personnel of a U.S. army infantry organization had been deprived of their rifles and assigned to the service of the newer agents of mass destruction. Not only was the old order changing; it was all but unrecognizable in the new. (See also AIR FORCES; ARMIES OF THE WORLD; EUROPEAN WAR; NAVIES OF THE WORLD.)

Murray, Augustus Taber (1866–1940), professor emeritus of classical literature at Stanford university, was born in New York city, Oct. 29, descendant of the man whose farm came to be known as Murray Hill. He was graduated from Haverford college in 1885 and in 1890 received a doctor's degree from Johns Hopkins. He then spent a year at the universities of Leipzig and Berlin. In 1892 he became the first professor of Greek at Stanford and was later made professor of classical literature. He served a year on the faculty of the American School of Classical Studies in Athens and translated the *Odyssey*, the *Iliad* and the private orations of Demosthenes for the Loeb Classical library. During the administration of President Hoover he was minister of the Friends' meeting in Washington attended by the president. He died in Palo Alto, Calif., March 8.

Murray, Philip (1886–), U.S. labour leader who succeeded John L. Lewis as president of the Congress of Industrial Organizations in 1940. A native of Scotland, he was born in Blantyre May 25 and emigrated to the United States in 1902. Naturalized in 1911, he became a member of the international board of the United Mine Workers of America the next year, president of the union's fifth district in 1916, and international vice-president in 1920. During the war of 1914–18 he was a member of Pennsylvania's regional war labour board and served also on the National Bituminous Coal Production committee. In 1935 he was named to the National Industrial Recovery board and to the advisory council of the National Recovery administration.

Murray was Lewis's choice for second president of the C.I.O. after Lewis had fulfilled his pre-election promise to resign if President Roosevelt was elected for a third term. Lewis, who continued to dominate the annual convention of the organization personally nominated Murray, and the latter was elected unanimously Nov. 22 without an opposition candidate. Murray then announced that he would conform strictly to the policies outlined and followed by his predecessor.

Music. Two tendencies marked the trend of music in the year 1940. The first was the centralizing of significant musical production in the new world and in the few corners of Europe untouched by the European War. The second was a changing

attitude on the part of composers toward the fundamental tenets of their art. Neither of these two trends was entirely a product of this single year. They were partly a result of the war and partly the natural culmination of trends in the evolution of music. Expression of a change of attitude was to be found in many writings of composers themselves and in the attitude of composers as it was reflected by critics. Virgil Thomson, composer of the opera *Four Saints in Three Acts* to a libretto by Gertrude Stein which made such a sensation in New York, and the new, provocative critic of the *New York Herald Tribune* published in the May-June issue of *Modern Music* an article "Paris, April 1940," which gives a most plain expression of this changing viewpoint.

"The lotus-land of whether surrealism is really gratuitous and whether such and such a picture by Picasso is really worth the price asked . . . that stormy lotus-land of commercialized high esthetics to which New York's Museum of Modern Art will long remain a monument, have quietly passed away. It is rather surprising and infinitely agreeable to find that poets now are writing poetry again rather than rhymes about current events; that painters paint objects, not ideas; that composers write music to please themselves. . . . Most surprising and agreeable of all is the fact that the young have again become visible as young . . . Instead of discussing esthetics with intelligence and politics with passion, as their elders did for so long, they are discussing esthetics with passion and politics with intelligence. . . . Young poets and young painters . . . look us squarely in the eye and say 'hokey'. . ."

Another modern composer wrote in 1940 of the "dreary Escheranto of the twelve-tone system." And most illuminating of all was the sad regret of the ultramodern of yesterday who found that "as a whole the program offered nothing in the least problematical." In a word, there seemed to be a much more genuine concern on the part of the young composer in the expressive quality of his art, and a lesser concern with the foibles of ultramodernism as they had come to him from composers since 1920.

Great Britain.—The most poignant musical expressions from beleaguered Europe in 1940 were not from the concert stage. One read of British children singing "There will always be an England" as their boat sank beneath them in the mid-Atlantic; of lonesome Polish soldiers on the east coast of Scotland giving a concert of their own music with a few Scottish airs on the bagpipes; of intrepid performers in London's famous concert halls performing chamber music extemporaneously long past the end of the concert in order to keep the audience interested during an air raid. However, from the standpoint of serious musical contribution there was in 1940 not much to be reported from Britain. The concerts of the London Contemporary Music centre were not a great success. New works by Herbert Howells, Lennox Berkeley and Lord Berners were performed. A *String Quartet* by Herbert Murrills was the most interesting and was chosen to represent Great Britain at the International Society of Contemporary Music.

France.—One would hardly expect to find that there were important musical productions in France in 1940. Nevertheless there was a brilliant production of Darius Milhaud's *Medea* at the opera on May 8, two days before the German invasion of Holland and Belgium. The repeated performances on May 15 and 25 were, of course, not well attended, but it is amazing to think that the productions of this new modern work took place during the blackest hours of the battle of France. It is not easy to report on the musical activities in Germany. Opera performances continued, and, as usual, Wagner and the Italian operas made up the repertoire. Young composers, such as there are, seemed more interested in cantatas written for organizational meetings than in any other form of music.

Italy.—Musical activity in Italy was more vital. This was probably due to the fact that the opera is a very important part of the social life of Italians, and new operas are necessary to give brilliance to the season. By far the most significant performance was Luigi Dallapiccola's opera on Antoine de Saint Exupéry's *Night Flight* which was produced in Florence. There is a degree of interest in the fact that a famous English opera, Purcell's *Dido*

and *Aeneas*, was given its first performance in Italy in 1940. In Rome, Ludovico Rocca's opera *Monte Ivnor* was successfully presented. In Genoa the opera *L'Intrusa*, composed in 1920 by the musicologist Guido Pannain on a text of Maeterlinck, was performed. We have reports that Malipiero, the most famous Italian composer living, finished an opera *Ecuba* after Euripides.

Switzerland.—When one turns to Switzerland one finds a much more brilliant and interesting musical season. Most outstanding occasion was the performance in Basle of Honegger's *La Danse des Morts*. As with other choral works by this composer, Paul Claudel was the librettist. This cantata was inspired by the figures of death in the old woodcuts, especially those by Holbein the younger. The musical score is one of Honegger's finest and to be ranked with *Roi David* and *Jeanne d'Arc*. Ansermet conducted several important new works on radio concerts: a *Concerto* for cello and orchestra by Henri Gagnehin, and new works by Frank Martin, Robert Oboussier, Roger Vuataz and Pierre Wissmer. *Hymnus*, a new work for orchestra by Willy Burkhard, who is considered the great hope of Swiss music, was performed in Winterthur, Geneva and Berne.

The Americas.—In the United States of America there was an increasing interest in the music of Latin America, partly because of organized concerts of the music of various southern neighbours, partly because of the reports of musical emissaries, and partly from the space given in U.S. musical periodicals to Latin-American activities. In Argentina there is an especially active school of composers. Twelve-tone music is written by the left-wing composer, Juan Carlos Paz. More typically Argentinean is the music of the "Grupo Renovacion," including the composers Juan José Castro, José Maria Castro, Jacobo Ficher and Honorio Siccaldi. Juan José Castro is best known for his *Sinfonia Biblica* which was heard in New York city performed by the Schola Cantorum. A new ballet, *Offenbachiana*, was presented at the Colon. The younger Castro, José Maria, is more known for his chamber music, such as the *Sonata de Primavera* for piano and a *Sonata* for two cellos. A chamber music work by Jacobo Ficher was honoured by an Elizabeth S. Coolidge prize. A ballet on an Argentine-Indian folk subject by Alberto Ginastera was given its première in July. Brazilian music became more and more associated with the works of Villa-Lobos. *Choros No. 10* was presented in New York city with great success and was notable for its unusual orchestration. A new work, *Maracatu de Chico Rei*, by the Brazilian composer Francisco Mignone, was also presented by the Schola Cantorum. The Brazilian conductor and composer Burle Marx appeared in several cities of the United States after the concert of his music at the New York World's Fair. A symphonic work, *Pater Noster*, was presented during the season. A program of Mexican music was also heard in New York city and is available through Columbia records. There are three compositions by Chavez in this group and several by Louis Sandi. This music of Mexico appeals to one as the most vital and most beautiful that has come from Latin America. North American contacts with Latin America were encouraged by a good-will tour of an orchestra of brilliant youngsters, conducted by Stokowski, and a tour by Toscanini and his fine radio orchestra.

There can no longer be doubt that creative work in North America is flowering. A considerable number of new works by well-known composers were performed in 1940. In Chicago, Ill., a *Symphony* by John Alden Carpenter and a *Sinfonietta* by Leo Sowerby were presented. In Boston, Mass., a *Concertino* by Edward B. Hill was successful. Howard Hanson's *Third Symphony* proved an ambitious work with sound workmanship. The music of Frederick Jacobi was widely performed during the year. His *Piano Quintet* was played by the Pro Arte, the Gordon and the Coolidge quartets, with the composer's wife, Irene Jacobi,

A MEMORIAL CONCERT devoted to the music of George Gershwin was played by the New York Philharmonic-Symphony orchestra July 13, 1940, before 20,000 people in Lewisohn stadium, New York city

at the piano. A *String Quartet* written on the twelve-tone technique by Wallingford Riegger was performed by the Galimir quartet on two occasions. From Roy Harris came several new scores: the *Third Symphony*, widely performed in the course of the year; a new *Folk Song Symphony*, heard in Rochester, N.Y., and Cleveland, O.; *The American Creed*, commissioned by the Chicago Symphony orchestra; and *Four Preludes and Fugues* for string quartet, performed by the Galimir quartet at "Yaddo," Saratoga Springs, N.Y. Aaron Copland's music, written for the cinemas *Of Mice and Men* and *Our Town*, did much to make this composer more widely known. Walter Piston proved himself a composer of remarkable fecundity. Three major works of his were given their premières during the year: a new *Sonata* for violin and piano, a work of fine feeling and elegant craft; a *Concerto* for violin and orchestra; and a *Concerto* for piano and orchestra, both of the latter presented by the Boston Symphony orchestra. Two new recordings of Piston's works were issued by Columbia: the ballet, *The Incredible Flutist*, which was performed in 1939 and 1940 at the Festival of American Music at Rochester, and the new *Sonata* for violin and piano. It is entirely possible to judge Piston's position in American music from recordings that have been made. Roger Sessions had two new works performed. His *Concerto* for violin and orchestra was heard in Chicago. Two new piano pieces, *Pages from a Musical Diary*, were given in New York city. A new sextet for strings by Berezowsky was performed on several occasions. Otto Luening was heard in a *Sonata* for flute and piano and an orchestral work, *Prelude on a Hymn Tune* by William Billings. Chamber music by Quincy Porter and Richard Donovan was given at the Festival of American Music at "Yaddo." A *String Quartet* by Bernard Wagenaar was given by the League of Composers.

A number of younger American composers were being heard. In Canada the music of a French-Canadian Montreal composer, Hector Gratton, attracted attention. Several new works by David Diamond were given, the most interesting a *Concerto* for orchestra. David van Vactor, a flutist of the Chicago Symphony orchestra, composed some effective scores. The work of a young Minneapolis, Minn., composer, John Verrel, was performed by the Greek conductor, Metropoulos. Robert Palmer proved himself a serious composer of promise in his *Piano Sonata*, performed by John Kirkpatrick. The Ohio composer, Alvin Etler, continued to be heard from. Robert McBride continued to draw upon his natural sense of humour. In fact, the list of new names is a very long one

and cannot be completely presented. One has the impression of great musical activity on the part of younger composers in 1940, in channels not entirely charted.

The Refugee Composers.—

The influence of European composers and musicians newly arrived in the U.S. continued to be felt. To the names of Hindemith, Schoenberg, Stravinsky, Ernst Krenek and Ernst Toch already settled in the United States, must be added Darius Milhaud, Bela Bartok, Benjamin Britten, Karol Rathaus, Paul Dessau and Castelnuovo-Tedesco. These men influenced the musical culture of America in a

very broad way. Orchestral concerts included their latest works. They influenced the music of the cinema and the radio. Several were in the employ of major universities and colleges. Both Schoenberg and Krenek addressed the Music Teachers' National Association. Several wrote in the English language concerning music. The theoretical ideas of Hindemith swept the eastern music schools in 1940. Important scores by these European composers and others not in the United States were heard in 1940. A *Symphony* by Darius Milhaud, commissioned by the Chicago Symphony orchestra, was given. A *Violin Concerto* by Hindemith was presented by the Boston Symphony orchestra. Several works by Prokofieff were heard: a *Cello Concerto*, the *Second Violin Concerto*, a *Sinfonietta* and the most popular and light *Peter and the Wolf*. *Quattro Vecchie Canzoni* by Malipiero was presented at the Coolidge festival in Washington. At the same concert, *Epithalamium*, a cantata by Pizzetti, and a *Sonata* for two violins and two pianos by Fitelberg were given. Bela Bartok's *Sonata* for two pianos and percussion instruments was performed. Chamber music by Rathaus, Stephan Wolpe and Nikolai Lopatnikoff were given.

(R. L. Fy.)

Music, Popular. The year 1940 will be remembered always as marking a definite break between the largest wholesaler and the largest retailer of popular music. The National Association of Broadcasters went on record as refusing to pay the licence fees asked by the American Society of Composers, Authors and Publishers (ASCAP), and at the close of the year most of the popular music and much of the serious music of the world went off the air.

Radio had decided by early spring to boycott all ASCAP copyrights after the conclusion of current contracts, and set up its own publishing company, Broadcast Music, Inc. (known as BMI), to compete with the output of most of the world's successful composers since 1884. After the failure of repeated attempts to bring the warring organizations into conference, the department of justice announced that actions would be instituted against the National Broadcasting company, Columbia Broadcasting system, National Association of Broadcasters, ASCAP and BMI. Whether this threat would bring the combatants together was one of the questions for 1941 to solve.

Several of the popular songs of BMI entered the Hit Parade, the most successful being "Practice Makes Perfect," by Ernest Gold, formerly employed by the Songmart, a recognized clearing-house for amateur composers. Sheet music and record sales showed a solid list of ASCAP hits, and no BMI number came

within the "first fifteen," as given by *Variety*. According to this list, the biggest seller of the year was "South of the Border," which had already established its popularity in 1939. Next came "Oh, Johnny," repeating its success of 1917, largely through the interpretation of Bonnie Baker. Third and fourth places were filled by the psychologically related songs, "Scatterbrain" and "Careless."

Fifth in the list was "Indian Summer," a vocal version of the Victor Herbert instrumental classic of many years ago. Then came "In an Old Dutch Garden," "When You Wish upon a Star" from Disney's "Pinocchio"), the "Woodpecker Song," "Playmates" and "Make Believe Island." Irving Berlin's "God Bless America" (with all royalties going to the Boy and Girl Scouts) finished in eleventh place, followed by "I'll Never Smile Again." The final trio in the first fifteen were "Blueberry Hill," "Ferryboat Serenade" and "Only Forever."

With radio's ban on copyrighted music, arrangements of material in the public domain became distressingly common. By the end of the year, the jazzing of the classics and folk-music was in full swing, with Stephen Foster the chief sufferer.

Musical comedy flourished in 1940. Cole Porter had his quota of successes in *Panama Hattie*; Rodgers and Hart produced an excellent score for *Pal Joey*; Berlin did his bit for *Louisiana Purchase* and Vernon Duke contributed some good music to *Cabin in the Sky*. Late in the year, Jerome Kern and Oscar Hammerstein came out with an individual surprise in "The Last Time I Saw Paris." In the purely instrumental field the youthful Morton Gould did notable work as creator, arranger and conductor. (See also MUSIC.) (S. Sp.)

Mussolini, Benito (1883—), Italian statesman and dictator. For his earlier career, see *Encyclopædia Britannica*, vol. 16, pp. 28-31. His conference with Hitler at Brennero March 18, 1940 reaffirmed the axis ties and was a prelude to the events of the following months. Il Duce chose June 10 as the propitious date for entering the war, doing so with the declaration that "our conscience is entirely clear." After a few desultory thrusts at dying France he consulted with Hitler at Munich June 18 on the terms of peace. Italian military activities then remained in relative abeyance until the beginning of the Egyptian campaign on Sept. 12.

Two other important conferences with Hitler followed during 1940, one on Oct. 4 at Brenner pass and the second at Florence on Oct. 28, the day Italy began operations against Greece. Reverses in the latter campaign obliged him to shake up his military command Dec. 6 and accept the resignation of Marshal Badoglio (*q.v.*). In his first public speech after Italy's entry into the war, Mussolini declared on Nov. 18 that "we shall break Greece's back, whether in 2 or 12 months it little matters." (See also ITALY.)

Myers, Jerome (1867-1940), U.S. artist, was born in Petersburg, Va., March 20. He went to New York city at the age of 19 to study art at Cooper union and the Art Students' league.

He received a bronze medal from the St. Louis exposition for his paintings on exhibition and won several prizes from the National Academy of Design. His paintings are in museums in New York city, Chicago, Washington, Rochester, Milwaukee, Newark, Los Angeles and New Orleans. He was author of an autobiography, *An Artist in Manhattan*, published on his birthday in 1940. He died in New York city, June 19.

Nagel, Charles (1849-1940), U.S. secretary of commerce and labour under President Taft, was born in Colorado county, Texas, Aug. 9, the son of a physician. The family moved to St. Louis in 1864 where the son studied law at the St. Louis Law school and continued his studies in Berlin. On his return he was admitted to the bar and won distinction in his profession. He was a lecturer in the St. Louis Law school, served in the Missouri legislature and was a member of the Republican National committee for four years. He died in St. Louis, Jan. 5.

National Academy of Sciences. The National Academy of Sciences was incorporated by act of congress in 1863 for the purpose of investigating, examining, experimenting and reporting upon any subject of science or art whenever called upon by any department of the United States government. Membership is by election, in recognition of outstanding achievements in scientific research, and is limited to 350 active members and 50 foreign associates. Members must be citizens of the United States.

New members are elected by the academy on nominations from its 11 sections: mathematics, astronomy, physics, engineering, chemistry, geology and palaeontology, botany, zoology and anatomy, physiology and biochemistry, pathology and bacteriology, and anthropology and psychology. The names considered by the sections in their nominating ballots originate from suggestions made by members; consequently, there are no applications for membership.

At the annual meeting held in Washington, D.C., April 22, 23 and 24, 1940, 15 new members were elected, as follows: Rollin Thomas Chamberlin, Carl Ferdinand Cori, George Washington Corner, Louis Frederick Fieser, Wendell Mitchell Latimer, Karl Friederich Meyer, James Bumgardner Murphy, Isidor Isaac Rabi, Stephen Walter Ranson, William Jacob Robbins, Richard Edwin Shope, William Hay Taliaferro, Stephen Timoshenko, Ernest Glen Wever, Claus Hugo Hermann Weyl. Four foreign associates were elected: Bernardo Alberto Houssay, James Peter Hill, Giuseppe Levi and Sir Henry Hallett Dale.

Three medals were presented at the dinner on April 23, 1940:—The Agassiz medal for Oceanography (gold), to Frank Rattray Lillie, past president of the Woods Hole Oceanographic institution, for his important contributions to the science of Oceanography; the Public Welfare medal (gold), to John Edgar Hoover, of the Federal Bureau of Investigation, for his application of scientific methods to the problem of crime prevention; and the Charles Doolittle Walcott medal (bronze) and accompanying honorarium, to A. H. Westergaard, of the Sveriges Geologiska Undersökning, Stockholm, Sweden, for his eminent researches on the stratigraphy and palaeontology of the Cambrian formations of Sweden.

The autumn meeting was held at the University of Pennsylvania, Philadelphia, Pa., on Oct. 28, 29 and 30, 1940.

The academy publishes an annual report, biographical memoirs of its deceased members, occasional scientific memoirs and monthly *Proceedings*.

The officers of the Academy are: Frank B. Jewett, president; Arthur L. Day, vice president; L. J. Henderson, foreign secretary; F. E. Wright, home secretary; J. C. Hunsaker, treasurer and Paul Brockett, executive secretary. The Academy building is at 2101 Constitution avenue, Washington, D.C. (P. Br.)

National Debts. The national debt of a country generally indicates the extent to which the central government has resorted to borrowing over the years to balance the deficit between its expenditures for all government services and investments and its revenues from taxation and various minor sources. While revenues in all countries have equalled or exceeded expenditures during many years in the past, the worldwide trend of national debts has been upward, particularly since 1914. This upward trend has been primarily a result of the tremendous expenditures required in modern war, though during the past decade public spending to relieve unemployment has also been of major importance in certain countries. It was only with the war of 1914-18 that the national debt of the United States rose to substantial size. Before the Civil War it never exceeded \$100,000,000 and even that conflict increased the debt to only \$2,678,000,000. In subsequent years more than half of the total was liquidated so that by 1916 the national debt was reduced to \$1,225,000,000. From this low level the debt rose precipitously during the World War years and by 1919 reached a total of \$25,482,000,000. Under the peaceful and prosperous conditions of the '20s liquidation again took place, an excess of revenues over expenditures at the rate of about \$1,000,000,000 a year lowering the government's obligations to \$16,185,000,000 by 1930.

Since the acute phase of the economic depression which began toward the end of 1929, however, government expenditures have constantly exceeded revenues, with a resulting steady increase in the national debt. At first this was merely a consequence of the depression as the sharp fall in the national income drastically curtailed government revenues. But in the course of the administration of Franklin D. Roosevelt the increase in the national debt became a positive aspect of economic policy designed to promote business recovery. For the first time in United States history heavy government expenditures were used as a remedy for business and economic depression. These increased expenditures were in part due to the assumption of a relief load (for the unemployed, agriculture and other groups) which could no longer be carried by state and local governments and in part to enlarged requirements for national defence. Over and above these however, were expenditures for public improvements and work programs, such as waterworks, sewage-disposal plants, power facilities, schools, libraries, recreation facilities and other projects. These projects were designed not only to serve the public need which their titles imply; they were conceived in total as a stimulus to the economy both by their direct contribution to the national income, and by their indirect effect upon consumption and private investment. The national debt rose from \$23,815,000,000 at the end of 1933 to \$41,961,000,000 at the end of 1939 largely because of the adoption of this controversial policy.

While this policy, a subject of considerable disagreement, has been popularly designated "pump-priming" and "government spending," it might, with equal appropriateness have been called "government debt creation" since, according to the theory on which it is based, the debt creation is as important as the spending. Obviously government spending could be increased by the raising of additional revenues from taxation, but this procedure would not meet the economic problem that the spending-through-borrowing policy was designed to attack. For insofar as the tax receipts came from funds which would have been spent for consumption goods or from savings which would have been spent for investment goods, there would be no added stimulus to economic activity. Only from such tax receipts as might be derived from savings which would have been hoarded could an increase in the

national income be expected. Through debt creation financed by means of new bank credit, however, an increase in government spending might be achieved which need not directly reduce private spending.

It is seldom realized that under modern conditions the volume of saving at high levels of the national income cannot be utilized without increasing some of the various types of debt. Many individual savers prefer to invest in the form of debt obligations rather than in equities and many institutionalized savings are limited by law to investment in debt obligations. And, as is well known, the net saving of society must be invested if national income, business profits and employment are not to fall. During the decade of the '20s four major types of debt increased sufficiently to maintain a high level of employment despite the considerable liquidation of the national debt: (1) Private business debt; (2) consumers' debt; (3) state and local government debt; and (4) foreign debt (investments abroad).

Why these types of debt failed to expand sufficiently to create full employment during the decade of the '30s is still a matter of sharp controversy. However, such was the case. In fact, all except consumer debt actually declined from 1933 to 1939. In their stead the Roosevelt administration used continuous increases in the national debt to stimulate employment and general economic activity.

Although this policy was still a major factor in the rise of the national debt in 1940, the situation was fundamentally changed by the vast defence program initiated around the middle of the year. Defence appropriations and authorizations enacted by the congress from June 1940 and other recommendations of the president, including those contained in the budget for the fiscal year 1942, made the total defence program \$28,480,000,000. Such a huge program undoubtedly opened a new chapter in the history of the national debt.

Defence expenditures were increased rapidly after the inauguration of the new program, contributing to the continued rise of the national debt in 1940. By the end of the year the debt reached \$45,024,631,000, despite various new taxes enacted by the congress, thus just exceeding the old statutory limit of \$45,000,000,000. Provision had been made in the first Revenue act of 1940, however, for a \$4,000,000,000 increase in the debt limit.

Table I.—Gross Debt of the United States, 1913-42

June 30	(Millions of dollars)	June 30	(Millions of dollars)
1913	1,193	1928	17,604
1914	1,188	1929	16,931
1915	1,191	1930	16,185

1926	19,643	1941E	49,157E
1927	18,510	1942E	58,397E

Source: Data from 1913 to 1940 are from U. S. Treasury Department, daily treasury statement (revised); 1941 and 1942 are estimates reported in budget of the United States government for the fiscal year ending June 30, 1942 as presented to the congress by President Roosevelt.

By the end of 1940 it was evident that the contemplated increase in the defence effort had made the new statutory debt limit inadequate. Secretary of the Treasury Morgenthau suggested that the debt limit be raised to \$65,000,000,000 and, in his annual budget message, President Roosevelt questioned the significance of any statutory debt limit, except as it served as a fiscal monitor. Since the president stated as his opinion that it was necessary to finance a substantial part of the defence program through borrowing it appeared likely that the national debt would continue to rise markedly for the duration of the war period. In the 1941 budget message of President Roosevelt, the deficit for the fiscal year 1942 was estimated at over \$9,000,000,000, despite expectations of greatly increased revenue from existing taxation. It is interesting to note that the president reiterated the fiscal ideas upon which his administration was based by stating that such drastic taxation as would be required to finance the defence program on a pay-as-you-go basis would interfere with the full use of our productive resources.

In other words, he felt that the stimulus of government debt creation was necessary for the establishment of relatively full employment.

The question in many minds, however, was whether the already large total of the national debt and the further increase which seemed likely might not lead to inflation. On this question it can be stated that the absolute size of existing debts, public or private, cannot produce inflation. Inflation results when the total flow of expenditures, public plus private, is larger than can be met by current production at current prices. When unused resources are available, an increase in expenditures will result in increased production and not in inflation, except insofar as this might be prevented by shortages of specific commodities or speculative price rises.

The relation of inflation to an increase in debt arises from the fact that the flow of expenditures can be increased through an increase of bank credit either by government or by private borrowing. If this occurs after full employment is reached, it must necessarily result in an inflationary rise of prices and costs. Borrowing can take place and even increase without causing inflation, however, provided that it derives from increased saving and not from increased bank credit. For in the latter case total spending is not increased, purchasing power being merely transferred from the saver to the borrower (government or private).

Table II.—National Debt of Various Countries

Source: Statistical Year-Book of the League of Nations, 1939-40, Geneva, 1940. Federal Reserve Bulletin; Official Government Reports. Latest end of fiscal year data available.

Since 1940 was a year of war on three continents and of heavy armament expenditure throughout the world, there is no doubt that the national debts of all major countries were increased by substantial amounts. Reliable figures for most countries, however, were not available. For in addition to the usual difficulty that reports are only made at the end of the fiscal year, the totalitarian powers suppressed, either entirely or in part, information on their fiscal operations.

Furthermore, little was known about government financial conditions in the conquered nations of Europe.

The national debt figures which were issued for a few major countries, however, indicate what occurred because of war conditions. The debt of Great Britain rose from £8,475,000,000 on Sept. 30, 1939 to £10,106,000,000 on Sept. 30, 1940, an increase equivalent to \$6,524,000,000 for the period covering approximately the first year of war.

In Canada the national debt rose from \$3,642,049,000 on March 31, 1939 to \$4,028,573,000 a year later and the rate of increase is believed to have been accelerated since the more active phase of the war began in May 1940. An increase in the publicly revealed debt of Germany from \$39,748,900,000 on Sept. 30, 1939 to r.m. 76,980,000,000 on Nov. 30, 1940 was made known, but these figures are of limited meaning (except insofar as they suggest the extent of the German war effort), because they do not represent the total government debt at either date.

In Table II are presented the national debts of various countries for the end of the latest fiscal year available. It should be kept in mind that these figures are not comparable with each other because of differences in the division of responsibility between the national and local government in each country, because of differences in size, wealth and population, and because of differences in services rendered or investments made by government. Moreover, in these days of controlled exchange and the conversion of local currencies into a common unit, such as the dollar, it is exceedingly difficult. National Defence: see DEFENCE, NATIONAL.

National Education Association

The National Education Association of the United States, organized in Philadelphia in 1857, "is dedicated to the upbuilding of democratic civilization and supported by the loyal co-operation of the teachers of the United States to advance the interests of the teaching profession, promote the welfare of children and foster the education of all the people."

It has a membership of over 200,000 and is governed by a representative assembly composed of delegates from state, territorial and local units. Its official organ is *The Journal of the NEA*

issued to all members monthly except during June, July and August.

The association's winter convention was held in St. Louis, Mo., Feb. 24-29, 1940; its general convention in Milwaukee, Wis., June 30-July 4, 1940. The 1941 conventions are to be at Atlantic City, N. J., in February and Boston, Mass., in July. Leading activities of the association during 1940 were the activities of the Educational Policies commission, appointed by the NEA and the American Association of School Administrators to define guiding policies in American education; the continuing campaign on behalf of teacher welfare and federal aid for elementary schools and high schools; and the development of Future Teachers of America for high school and college students. American Education Week, sponsored by the association and allied groups for the 20th year on Nov. 10-16, 1940, was built around the theme "Education for the Common Defence." This observance brought millions of visitors into the schools.

Association headquarters are in its own building at 1201 16th Street Northwest, Washington, D.C.; president for 1940-41, Donald DuShane, superintendent of schools, Columbus, Ind.; executive secretary, Willard E. Givens. (See also ACADEMIC FREEDOM; EDUCATION.) (J. E. Mo.)

National Geographic Society.

Organized in 1888 "for the increase and diffusion of geographic knowledge," and since 1899 directed by Gilbert Grosvenor, the National Geographic Society has completed over a half-century of noteworthy achievement. It had in 1940 a membership of 1,100,000 in all parts of the world—the largest educational institution of our time. In addition to the editorial and photographic surveys constantly being made, the society has sponsored more than 100 scientific expeditions, some of which required years of field work to achieve their objectives. Narratives of these expeditions and other explorations, together with photographic surveys, are presented to the society's membership through the pages of the *National Geographic Magazine*. To form a pictorial record of world geography, the society has assembled a gallery of some 300,000 photographs, over 25,000 of which are in natural colour.

During 1939 the society in co-operation with the Smithsonian institution sent an archaeological expedition to Veracruz, Mexico. M. W. Stirling, leader of the party, reported on Jan. 16, 1939, the discovery of the oldest dated work of man yet uncovered in the Americas, a Mayan stele bearing a date equivalent to Nov. 4, 291 B.C. A second expedition sent to the same general region in 1940 uncovered five colossal heads and numerous other monuments of vanished Americans. Mr. Stirling's account of the new finds was published in the Sept. 1940 issue of the *National Geographic Magazine*.

Over 175 fossil specimens, including a rhinoceros skull 28 in. long and the skull of an 8-foot-long pig, were obtained by the National Geographic Society-South Dakota School of Mines palaeontological expedition, which spent three months in the Bad Lands of South Dakota in the summer of 1940. Dr. Joseph P. Connolly, president, and James D. Bump, museum curator, of the School of Mines, led the expedition.

Cloudy weather made it possible for the National Geographic Society-National Bureau of Standards expedition to obtain only a partial record of the total eclipse of the sun on Oct. 1, 1940. Eight tons of equipment were set up under the supervision of Dr.

Irvine C. Gardner at Patos, Brazil. Photographs were made of the inner corona, of the flash spectrum and of the four times apparent contact of the sun and moon. Tests with radio signals to determine the behaviour, during eclipses, of the ionized layers in the upper atmosphere (the so-called "radio-reflecting layers") were successfully completed.

Another aspect of science was studied by the society which co-operated with the Oceanographic institution of Woods Hole, Mass., in an investigation of ocean basins. Dr. Maurice Ewing, Lehigh university, was the leader of the expedition. Satisfactory progress was reported by Dr. G. W. Gartlein, director of the National Geographic Society-Cornell university three-year study of aurorae.

In addition to its magazine the society has published a series of nature books. The most recent is *The Book of Fishes*, edited by Dr. John Oliver La Gorce, the most comprehensive, full-colour presentation yet published of the better known species of North American inland and coastal waters. The two-volume *Book of Birds*, edited by Dr. Gilbert Grosvenor and Dr. Alexander Wetmore, in this series is the first book to be published portraying full-colour illustrations all the known species of birds on the North American continent, north of Mexico. The scientific monograph entitled "An Initial Series from Tres Zapotes, Veracruz, Mexico," was published in 1940 as one of the society's series of *Contributed Technical Papers*. (G. Grosvenor)

National Guard. The development of the national guard, one of the three main components of the United States army, was greatly accelerated during the year 1940. As the year began, the national guard, which then had units in every state, territory of Hawaii, Puerto Rico and in the District of Columbia, had just completed an augmentation authorized in the president's executive order of Sept. 8, 1939, of 43,287 officers, warrant officers and enlisted men. At that time, too, the national guard was in the midst of extra training activities authorized by the same executive order. By the middle of the year the strength of the national guard reached 14,561 officers, 214 warrant officers and 226,837 enlisted men. For the first time all national guard units were allotted to the territory of Alaska and were in the process of organization.

The latter half of 1940, however, saw an even greater increase in the strength and training activities of the national guard. During August most of its units participated for 21 days in the large army manoeuvres held in different parts of the United States. A strength of approximately 210,000 underwent intensive training. Over 30,000 not participating in the large manoeuvres received the same length of training in their state areas.

Legislation passed by congress and approved by the president on Aug. 27 authorized the president to order any or all members and units of any or all reserve components of the army of the United States, including the national guard, into the federal service for active duty in the army of the United States for a period of 12 consecutive months each. The first units brought into active federal service under this law were inducted on Sept. 16. At this time the strength of the national guard reached 15,828 officers, 214 warrant officers, 243,386 enlisted men, making a total of 259,428. Four infantry divisions of a total of 10 such divisions in the national guard and many other units were inducted on this date. Another large fraction was inducted in October, still other units in November and it was expected by early in the year 1941 the entire national guard would be undergoing its year of intensive training.

THE NATIONAL GUARDSMEN of New York's 244th coast artillery regiment were among the first called up for a year's duty in Sept. 1940

the areas of training for the national guard during this period prepared generally in the southern part of the United States though use was made of adequate state camps and some large army posts in the north and northwest. Most coast defense units underwent their training at the nearest harbour defenses. Adequate housing and training facilities were prepared in all training areas.

These activities toward a proper national defence were by far the most intense and extensive that national guard units have undergone in time of peace. The legislation authorizing training stated that the units inducted were for service in the limits of the western hemisphere, except for active service which might be required in any of the territories and possessions of the United States, including the Philippine islands. As the year closed, the war department was engaged in formulating plans to cover the status and training of the national guard for the period covered by the legislation referred to above.

(J. H. Ws.)

National Income. The most significant measure of the income of a nation generally is held to be the net output of all of the nation's producing enterprises. The magnitude of this national net production—national income—is important because the creation of commodities and services is the basic objective underlying all economic activities. As the national net product expands or contracts over a period of time, the nation has a larger or smaller supply of goods available for either current or future consumption.

National income, or the net value of commodities and services produced by all of the nation's business enterprises, aggregated at \$73,700,000,000 in the United States in 1940. This amount exceeded the value for 1939 by \$4,300,000,000, an improvement of more than 6%. The 1940 total also was higher than in any year since 1929.

Industrial Origin of National Income.—Since producing enterprises nearly always are specialized, and therefore perform only a part of the whole process of creating a given commodity or service, a summation of the total values of product for all producing enterprises would contain a large element of duplication. The total value of electric power, for instance, includes a large valuation for coal consumed in the process of producing the power, and, in many other cases as well, the product of one industry is largely raw material utilized in other industries.

It is possible, however, to determine the net production of a given business enterprise. This net production is the total product of the unit less all commodities (including capital equipment) and services of other enterprises that are consumed in the course of operations. By summation of net production figures so derived for each unit in a specified industry, the net product output of that industry may be obtained, and a further summation embracing all other industries similarly provides a national income aggregate. An analysis of the industrial origin of national income is presented in Table I.

National income advanced by more than \$34,000,000,000 from the depression low in 1932 to the recovery high in 1940. More than one-half of this increase took the form of higher net product values in agriculture, mining, manufacturing and contract construction, although these industries taken together accounted only one-quarter of the national net product in 1932. The other industries provided distribution and other services which are relatively better sustained in periods of declining business activity but which also do not expand rapidly as business in general demonstrates a cyclical recovery.

Except in the year of lowest production, manufacturing industries supplied the largest segment of the national net product

Table I.—Industrial Origin of U.S. National Income

in the years here covered. Government is another important contributor, and was one of increasing importance during these years because of the great expansion in the volume of government services.

Distributive Shares of National Income.—National income may also be conceived as a pool of commodities and services the value of which is apportioned among the persons who supply the labour and capital utilized in creating this national net product. Because the national economic organization is established on a monetary basis, most of this assignment of the national income value takes the form of actual transfers of money. Not all transfers are made directly to individuals, and actual transfers to owners of capital may be either larger or smaller than the net production attributable to capital, but all of the national net output, or equivalent values, must either be transferred or credited to individuals. Table II presents an analysis of national income in terms of the shares distributive out of this national net product to the different groups contributing to net output value.

Changes in the magnitude of the several shares in different phases of the business cycle are conditioned largely by the character of the claims against the national net product exercised by labour and by the different types of capital.

Salaries and wages are relatively less variable than some of the other shares. They are related closely to net product plus depreciation and depletion. Since depreciation and depletion charges are offsets against gross commodities and services created currently, equivalent to the estimated value of capital goods consumed during the year but produced in prior periods, employment of labour is required in the production of commodities and services equal in value to the depreciation and depletion allowances as well as in the creation of net product itself. Such charges are quite stable relative to year-to-year changes in the national income aggregates and therefore provide support for salaries and wages in years of lower business activity.

Interest charges are relatively fixed and do not vary significantly with short-term changes in the value of current net output.

*U.S. Department of Commerce data; method of presentation is the author's.
†Preliminary.

Net income of corporations, a share that accrues to risk-capital and is in part distributed in the form of dividends, fluctuates widely. It is relatively high in prosperous years and low, or even negative, when business activity is unsatisfactory. Net income of unincorporated businesses includes a very large labour income element in addition to return on risk-capital because self-employed persons contribute both their personal services and their capital in the conduct of their businesses, and this share consequently does not fluctuate as widely as the net income of corporations. Net rents and royalties shift markedly as relatively rigid costs of property ownership, such as interest charges and taxes, impinge upon variable gross rents.

Values and Quantities.—The summation of value figures is the only practicable means of combining the production of such divergent things as refrigerators and government services, aeroplane travel and silk stockings, services performed by religious organizations and by life insurance companies, and all of the thousands of other items which must be taken into account in determining the national net output. Previous discussion has been confined to value figures for this reason.

The quantity of net production is, however, more significant

†In dollars; population as enumerated or estimated for 1930. ‡Average of 1928 and 1934. §1928.

for some purposes than the value of net production. Since value always is the product of price and quantity, the investigator may approximate changes in the net quantity output by studying the value figures in conjunction with indexes of prices, and a "deflation" of net value of product aggregates yields figures indicative of the year-to-year changes in net quantity production or real national income. The 6% advance in the value of net production from 1939 to 1940, for instance, occurred during a period when prices were advancing only moderately, and nearly all of the improvement in national income represented a greater net quantity output of commodities and services in the second year.

No existing price series or combination of series are sufficiently comprehensive to permit an exact conversion of national income values to quantity net production basis, but approximate results may be obtained by references to indexes like those given in Table III. Quantity of net production appears to have declined by about one-quarter from 1929 to 1932, about the same in 1937 and 1939 as in 1929, and was highest of any year in 1940. It is entirely likely, in fact, that quantity production exceeded 1929 by a volume about great enough to compensate for the 8% growth in population over the intervening period and that real national income per person was about equal in 1929 and 1940.

Important Elements Controlling the Magnitude of National Income. The aggregate of national income is controlled largely by four very important factors: the level of prices, the quantity and quality of labour, the quantity and character of capital and the nature of the national socio-economic organization. As between different periods in the same country, and between different countries at the same time, at least the attainable level of national income is determined very largely by these factors. The recognition of their importance was especially significant in the United States in 1940 because a large-scale national defence program had to be effected primarily either by application of unutilized man-power and capital or by those factors plus some sacrifice in current consumption.

Of these factors, differences traceable to differences in prices are somewhat fictitious in character, since measures of national income are used principally as indicators of the net quantities of commodities and services available for current or future consumption. Population changes, including changes in the labour force, usually occur only slowly, although they may be accentuated by immigration. Similarly, capital accumulation, relative to existing stocks of capital goods, is not a rapid process normally, although it may be accentuated sharply by concerted national action, usually in the stimulus of political emergency and the guidance of strong central authority. Socio-economic changes, which usually occur only over a long period of time but also may be stimulated by rapidly changing business conditions, can be of such a nature that tasks performed in the home of the individual for himself are taken over by business enterprise, or, conversely, and such changes necessarily have an effect upon a measure of net production by business enterprises.

National Income, 1900-40.—According to the estimates shown in Table IV, national income in the United States has expanded markedly in the last 40 years.

The influences of price and population changes have been important during this period. Compared with present-day levels, prices were lower in the early 1900s, much higher in 1917-20 and somewhat higher in 1929-34. Population has increased from 76,129,000 persons in 1900 to 131,660,000 in 1940, and, further, an increasing proportion of the total population has fallen within the age ranges of greater productivity. Improving production techniques and a fairly continuous process of productive asset accumulation also were important, and it is likely that the performance of many services formerly rendered at home was taken over by business enterprises during this period. National Parks and Monuments. In little more than two-thirds of a century, a system of national parks, national monuments and other recreational areas undreamed of a century ago in any political economy, has been established and developed in the United States. The Yellowstone, the first national park, was established in March, 1872. On Dec. 31, 1940, there were 162 separate areas in the federal park system of the United States, with a total area of approximately 21,552,000 acres. Twenty-six of these areas are national parks, areas reserved by congress because of their spectacular scenery or some historic or scientific feature of outstanding national interest. Eighty-two are national monuments, and

ally established by presidential proclamation under authority of the congress because of historic, prehistoric, or scientific interest of national calibre.

In addition there are four national historical parks, 11 national game preserves, seven battlefield sites, nine national memorials of various types, six national historic sites, one national recreational area, 12 national military cemeteries, three national parkways, and a park system of the national capital, consisting of over 700 separate units in and around Washington, D.C.

During 1940 two of the nation's outstanding scenic regions—Kings canyon (California) and Isle Royale (Michigan)—were included in the federal park system. Kings canyon national park, the largest scenic wilderness of High Sierra peaks, numerous alpine lakes and groves of giant sequoias, was established March 4, 1940. Within its boundaries is the former General Grant national park, designated as the "General Grant Grove section"; also picturesque Mount Shasta, with its fine stands of sequoias, included by presidential proclamation of June 21, 1940. Isle Royale, a national park project since March 3, 1931, attained full national park status on April 3, 1940. Located in upper Lake Superior, 160 miles northwest of Keewenaw point, Mich., and 20 miles south of Thunder cape on the Canadian mainland, this park includes, in addition to rugged Isle Royale, a number of nearby islands and protruding rocks. Splendid hardwood and coniferous forests, numerous lakes and picturesque shores are features of this roadless wilderness.

Other areas included in the federal park system during 1940 are: White House national monument, Washington, site of an Indian mission and school established in 1836 by Dr. and Mrs. Marcus Whitman; Appomattox Court House national historical monument, Virginia, scene of the surrender of the Confederate army under General Lee to the Federal army under General Grant, April 9, 1865; Manassas battlefield national historic site, Virginia, site of the battles of First and Second Manassas fought July 21, 1861 and August 29–30, 1862; Vanderbilt mansion national historic site, Dutchess county, New York, a fine example of the type of estate built by captains of industry in the era of expansion that succeeded the War Between the States; and Gettysburg battlefield national cemetery, Montana, site of the battle of the Little Bighorn river in which Lieutenant Colonel George A. Custer and his command of 264 officers and men were destroyed by Sioux Indians. Excellent progress was made during 1940 on the construction of the 100-mi.-long Blue Ridge parkway, which, when completed, will connect Virginia's Shenandoah national park with the Great Smoky mountains national park in North Carolina and Tennessee. Sections of this parkway lying approximately 200 mi. have been completed and opened to travel. Approximately 50 mi. of the 455-mi.-long Natchez Trace parkway, which will link Nashville, Tenn. and Natchez, Miss., following to a great extent the Old Natchez Trace, historic Indian trail, have also been constructed. Visitors to the various units of the federal park system (exclusive of the national capital parks and completed sections of the national parkways) during the travel year ended Sept. 30, 1940, totalled nearly 16,750,000, a record number than in any previous travel year. An estimated 10,000 persons visited Great Smoky mountains national park on Labor Day, Sept. 3, and witnessed the dedication of that area by President Franklin D. Roosevelt. (N. B. D.)

Natural Gas. In 1939 production in the United States declined 6% to 2,437,200,000,000 cu.ft. of which 45% was used in the field, 52% for industrial, 16% for domestic consumption, and 5% for commercial consumption. The largest item of industrial use is the production of carbon black, which took 14% of total output.

Production in Canada increased 6% in 1939, to 35,400,000,000 cu.ft. and preliminary figures indicate a further increase in 1940. (G. A. Ro.)

Navicert System: see BLOCKADE; SHIPPING, MERCHANT MARINE.

Navies of the World. Though in some countries the effect of the European war which broke out on Sept. 3, 1939, has been to hold up or slow down the construction of new warships, in others the result has been the opposite. Especially has the latter been the case in the United States.

By Nov. 1940, there were no fewer than 42 battleships building or about to be begun, of which 7 were British, 17 U.S.A., 9 Japanese, 1 French, 2 Italian, 3 German and 3 Russian. In the cases of 4 British, 11 U.S.A., 5 Japanese and possibly 2 German, the displacement is between 40,000 and 50,000 tons. Of the remainder, all except four Japanese were to be of 35,000 tons, in accordance with the original limitation imposed by the London Naval treaty of 1936, which was expanded by agreement in 1938 to 45,000 tons, and by 1940 abandoned altogether. The four Japanese ships just mentioned were believed to be of about 15,000 tons, an enlargement of the German "pocket battleship" design. Three of them were reported to have been launched during 1939–40.

None of the various designs provided for a speed of less than 28 knots, and in the majority of instances the figure exceeded 30 knots. Other features common to all were absence of torpedo tubes, extensive protection against plunging fire or air bombing, an ample anti-aircraft armament, and the inclusion of seaplanes and catapults in the equipment. General similarity was inevitable in ships of equal displacement, affording little latitude for innovations if adequate defensive power, protection, speed and sea-keeping qualities were to be ensured. But considerable variation existed in 1940 as regards the calibre of the main armament. British 35,000-ton battleships were to be armed with ten 14-in. guns, and the 40,000 tonners with 16-in. U.S.A., Japanese and Russian battleships of 35,000 tons or over were all built to mount nine 16-in., while the French, German and Italians preferred either eight or nine 15-in. In range and accuracy there was believed to be little to choose between the three calibres, the main differences being the weight of the gun and its mounting, and of the

projectile that it fires. The Japanese 15,000-ton ships were reported to be armed with six 12-in. guns.

With the exception of Italy, whose naval staff regards such vessels as superfluous in view of the country's geographical position, all the above powers were building aircraft carriers, varying in displacement from 14,000 to 26,000 tons. A typical example of the most modern type of aircraft carrier is the British "Ark Royal" of 22,000 tons, which was completed in 1938. She has a speed of 31 knots, and is armed with 16 dual-purpose guns of 4.5-in. calibre. She can operate 60 aircraft, though her spacious hangars, arranged on two decks, could undoubtedly accommodate many more than these.

Cruisers have hitherto been limited by treaty to a displacement of 8,000 tons, and a maximum gun calibre of 6.1-in., but this does not apply any longer. The United States had in hand in 1940 a number of cruisers of from 10,000 to 13,000 tons, and other nations will doubtless follow suit. Though Japan was not a party to the 1936 treaty, there was no evidence in 1940 that she had laid down any cruiser of more than 8,000 tons.

Destroyers built in recent years are remarkable for their size, many of those recently built for the British fleet being of over 1,900 tons displacement, while the United States has ordered some of 2,100 tons. Japan has over a dozen of about 2,000 tons, and France's largest are of 2,884 tons. Italy has not yet gone beyond 1,729 tons, but was building a dozen cruisers of 3,362 tons, obviously designed to deal with destroyers. Germany's biggest destroyers were believed to be of 1,870 tons, but Russia completed several of about 2,900 tons.

All over the world in 1940 submarines were being built in large numbers. In the United States navy, under-water craft building or on order at the end of 1940 totalled no fewer than 80. Japan had about a dozen under construction, Italy 16, and Germany an uncertain but undoubtedly considerable number. France was to have built 25 of various types, but because of the defeat of 1940 few of these seemed likely to materialize, at any rate under the tricolour. Russia, which is believed to possess more submarines than any other nation, published no figures, but 20 was probably a conservative estimate of the number in hand.

British Naval Strength.—Of the new battleships which were under construction when war with Germany began in 1939, two were believed to have been completed in 1940. Equal progress

was probably made with other categories of new warships.

Assuming the expected degree of progress to have been made with new construction, the royal navy, by the end of 1940, included the following units: 13 battleships; 3 battle cruisers; heavy cruisers mounting 8-in. guns; 53 cruisers with guns of lesser calibre; 5 anti-aircraft ships (ex-cruisers); 1 minelayer; first line aircraft carriers; 230 destroyers, of which 50 were acquired from the United States navy in Sept. 1940; 45 submarines; 35 sloops; 20 fast escort vessels of the "Hunt" type; minesweepers; 10 patrol vessels; 3 aircraft tenders; 2 netlayers; 21 river gunboats; 6 coastal minelayers; about 40 motor torpedo boats and 3 monitors. How many ships were building in 1940 is impossible to say in the absence of any official information as to the tonnage begun since the outbreak of war. A great many trawlers and patrol vessels of the whale-catcher type known as corvettes, were understood to have been built or acquired since Sept. 1939.

One of the first steps taken by the British government on the opening of hostilities was to give notice of suspension of its obligations under the London Naval treaty of 1936, as well as under the naval agreements with sundry other countries, thus giving all the parties to these conventions freedom from all restrictions as to displacement and gun calibre placed on the various categories of warships.

The total personnel provided for in the 1939 navy estimate was 133,000, but this was increased considerably. Naval forces of the dominions, including the royal Indian, royal Australian and royal Canadian navies and the New Zealand division, are included in the above figures so far as material is concerned, but not their personnel, which with war additions must amount to over 15,000. There were reserves of personnel in other British overseas territories, such as Newfoundland, Kenya, South Africa, Hongkong, the Straits Settlements and Ceylon.

United States.—Great increases in the numbers of all classes of warships were approved during 1940. At the end of that year the total strength in service included 15 battleships; 18 heavy cruisers with 8-in. guns; 19 light cruisers with 6-in. guns; 10 aircraft carriers; 162 destroyers; 104 submarines; 10 gunboats; 27 patrol vessels; 9 motor torpedo boats; 18 aircraft tenders; 8 light minelayers and 57 minesweepers. Under construction or on order were 17 battleships; 48 cruisers; 13 aircraft carriers; 168 destroyers; 80 submarines; 9 aircraft tenders; 3 minelayers; 23 motor torpedo boats; 25 motor patrol vessels and 11 minesweepers. In Sept. 1940, the total personnel, including reserves called up for service, amounted to 239,281.

Japan.—Though official information concerning the imperial Japanese navy is nearly non-existent, it is believed that at the end of 1940 the total strength was: 10 battleships (if one which had been demilitarized has been rearmad as proposed); 12 cruisers with 8-in. guns; 25 cruisers with 6-in. or 5.5-in. guns; 50 destroyers; 12 torpedo boats; 62 submarines; 14 submarine chasers; 11 aircraft tenders; 18 minelayers; 18 minesweepers; 10 gunboats (including river craft). So far as unofficial reports are to be relied on, the following ships (building or completed) were: 5 big battleships and 4 small battleships; 6 or more cruisers; 2 aircraft carriers and a considerable number of destroyers, submarines and smaller craft. The total personnel was last reported was 107,000, but has almost certainly been increased since.

France.—As a result of the surrender of June 1940, the French navy was by the end of 1940 in a somewhat chaotic state. It appeared to include 7 battleships; 7 cruisers with 8-in. guns; 11 cruisers with 6-in. or 6.1-in. guns; 1 aircraft carrier; 2 demilitarized battleships of value only for harbour defence;

destroyers, of which 27 are between 2,126 and 2,884 tons displacement; 17 torpedo boats, 5 of them of the motor type; 74 submarines; 2 minelayers; 1 netlayer; 1 aircraft tender; 9 sloops; 26 patrol vessels; 20 minesweepers; 36 submarine chasers and 9 river gunboats. Under construction or completing there were believed to be 1 battleship, the "Jean Bart"; 6 destroyers; 4 submarines; 1 sloop and 7 minesweepers. Ships under control of the Vichy government were scattered between Toulon, Casablanca, Dakar and the West Indies, while the others were either in British hands or interned at Alexandria. The total personnel was about 85,000.

Italy.—At the end of Oct. 1940, Italian naval strength comprised 6 battleships; 7 cruisers mounting 8-in. guns; 13 with 6-in. or 5.9-in. guns; 53 destroyers; 66 torpedo boats; 69 motor torpedo boats; 96 submarines; 1 sloop; 1 aircraft tender; 13 minelayers; 41 minesweepers and 11 gunboats. There were under construction 2 battleships; 14 cruisers; 8 destroyers; 4 torpedo boats; 16 submarines; 1 sloop and an uncertain number of motor torpedo boats.

Germany.—At the same date German naval strength was believed to include 3 battleships (assuming the 35,000-ton "Bismarck" to have been delivered according to schedule) plus 2 armoured ships ("pocket battleships"); 2 ancient battleships suitable only for coast defence; 2 cruisers mounting 8-in. guns; 3 or 4 cruisers with 5.9-in. guns; 1 aircraft carrier; 19 destroyers; about 40 torpedo boats; approximately the same number of motor torpedo boats; 2 gunnery training ships, roughly equivalent to sloops and about 50 minesweepers. At the number of submarines in service it is impossible to guess with any approach to accuracy, but there must have been in 1940 about 100, if not more. Under construction, so far as was known, were 3 battleships; 6 cruisers; 1 aircraft carrier and 9 destroyers. More vessels were doubtless laid down since war began. The total personnel undoubtedly exceeded 50,000.

U.S.S.R.—Official information concerning the soviet navy as scanty as in the case of Japan, but the following particulars are regarded as reliable. Completed ships included 3 old battleships; 5 cruisers; 1 aircraft carrier; 40 destroyers; 28 torpedo boats; 130 motor torpedo boats; 170 submarines and a great many minelayers and minesweepers. Under construction or about to be begun were: 3 battleships; 2 cruisers; 2 aircraft carriers; destroyers and an uncertain number of torpedo boats and minesweepers. Total personnel in 1940 was probably nearly 40,000.

Estonia possessed 2 submarines; 1 torpedo boat; 4 minelayers and a number of smaller craft. Latvia had 2 submarines; 2 minesweepers and 1 gunboat. Lithuania could muster only a single patrol vessel. But under the new political status of these countries, all these vessels would presumably be absorbed in the soviet fleet.

Other European Countries.—Of the minor naval powers, the Netherlands had taken the most active steps to add to its naval strength prior to the German invasion. The existing fleet, which was in 1940 either serving with the British navy or in the East Indies, included 5 cruisers; 8 destroyers; 19 torpedo boats, of which 13 are of the motor type; 1 gunnery training ship; 2 sloops; 1 old coast defence ship; 9 minelayers and 11 minesweepers. Of the various ships that were building in Dutch shipyards, practically all were destroyed before the country was evacuated by Queen Wilhelmina's government. In the Netherlands Indies there were in 1940 14 vessels of the sloop type and an equal number of patrol vessels, belonging to the local government marine, attached to the royal Netherlands navy. Two minelayers were under construction at Sourabaya.

Of the Scandinavian nations, only Sweden up to the time of compiling this record contrived to preserve her neutrality. The royal Swedish navy in 1940 comprised 2 cruisers; 8 coast defence ships; 10 destroyers; 21 torpedo boats, 6 of which are of the motor type; 16 submarines and 6 minesweepers. There were

building 2 coast defence ships; 2 destroyers; 5 submarines and 36 minesweepers.

So far as can be ascertained, the following ships of the royal Norwegian navy were in 1940 still in existence, though many of them were in German hands: 2 coast defence ships; 16 torpedo boats, 2 of them of the motor type; 6 submarines; 3 minelayers and 10 minesweepers. Denmark, when occupied by the Germans in April 1940, possessed a fleet of 2 coast defence ships; 17 torpedo boats; 10 submarines; 1 minelayer and minesweepers. Four vessels engaged on surveying duties and fishery protection off Greenland or in Icelandic waters are understood to have escaped capture. Two torpedo boats were under construction at Copenhagen.

The Finnish navy included 2 coast defence ships; 5 submarines; 7 motor torpedo boats; 10 gunboats and a number of minesweepers and minelayers. Poland, although her navy

CUTAWAY DRAWING showing armour of a battleship. The dark gray section is the armour box which encloses the ship's vitals

ained severe losses when attacked by Germany, possessed 1940 2 destroyers; 4 submarines (3 of which are in Swedish ports); 2 ps and 2 motor patrol ves-

ain has been reorganizing naval forces since the conclusion of the civil war. There were in 1940 left in service 6 destroyers; 16 destroyers; 6 torpedo boats; 6 submarines; 4 minelayers; 4 sloops; 7 motor vessels and sundry smaller craft. Under construction were 2 destroyers; 3 submarines; 2 minelayers and 4 torpedo boats.

The Portuguese fleet, as modernized under the highly efficient regime of 1940, comprised 2 destroyers; 3 submarines; 7 torpedo boats and 4 gunboats. Owing to the European war, a further program of new construction was held in abeyance.

Greece, at the end of Oct.

1940, possessed 1 old cruiser; 10 destroyers; 13 torpedo boats; 6 submarines; 9 minelayers and 2 motor torpedo boats. Two destroyers and 4 motor torpedo boats were building.

The Turkish fleet was in 1940 made up of 1 old battleship; 4 destroyers; 9 submarines; 2 old cruisers used for training; 3 torpedo boats; 3 minelayers; 2 gunboats; 3 minesweepers and various smaller vessels. Four destroyers; 4 submarines and 2 minelayers were completing in British shipyards.

Romania in 1940 had 4 destroyers; 1 submarine; 3 old torpedo boats and 3 of modern motor type and some minor vessels. Two submarines and 2 minelayers were building or completing in Romania.

The royal Yugoslav navy possessed 4 destroyers; 4 submarines; 10 torpedo boats; 10 motor torpedo boats; 1 aircraft tender; 1 minelayer; a patrol vessel and an obsolete cruiser of no fighting value used for training. A destroyer and 2 submarines were under construction; but as the latter were being built in Germany, they were doubtless appropriated by that country.

South America.—But for the European war, orders for new ships would probably have been placed in Great Britain by several South American states.

The Argentine navy included 2 battleships; 3 cruisers; 4 coast defence ships; 16 destroyers; 3 submarines and 14 minesweepers. 10 sloops, designed for training duties, were in 1940 being built in Argentina.

Brazil possessed in 1940 2 battleships; 2 cruisers; 1 destroyer; 10 torpedo boats; 4 submarines and 8 minelayers. Nine destroyers were being built in Brazilian shipyards.

Chile, which in the efficiency of her navy considers herself second to no other country in South America, had in 1940 1 battleship; 3 cruisers; 8 destroyers and 9 submarines. A sloop was under construction in Chile.

Peru has been hindered by the instability of some of her recent governments from making much headway in the modernization of her navy. It included in 1940 2 cruisers; 2 destroyers; 4 submarines and some minor craft. Similar considerations apply to Ecuador, whose sea force amounted to no more than a single

CONNING TOWER, director towers, plotting room and section of turret in a battleship

gunboat.

Colombia had in service 2 destroyers; 3 gunboats and some vessels of less importance. Venezuela could in 1940 muster 5 gunboats, while Uruguay had 3 modern patrol vessels and one old sloop, used for training. Paraguay's force comprised 3 river gunboats.

Mexico had 4 modern sloops; 2 older vessels of similar category; 10 small gunboats and 3 coast guard patrol vessels. Cuba had 2 sloops, recently reconstructed; 5 gunboats and 7 patrol vessels. A new Cuban naval program was under consideration in 1940, to involve the acquisition of 1 cruiser; 8 sloops; 6 gunboats and some smaller craft.

Haiti had 2 small patrol vessels of no fighting value. The Dominican republic, in addition to an armed transport, had 3 patrol vessels. Nicaragua had a single patrol vessel. None of the other Central American republics appeared to own any vessels of importance.

Asia.—In the far east, the Chinese navy had in 1940 for practical purposes ceased to exist, though it is possible that a few small craft survived in the upper reaches of the Yangtze. Three vessels were under construction at Hongkong.

On the other hand, the navy of Thailand was completely reorganized as regards both material and personnel. Most of the newer ships have been built in Japan or Italy. There were in service in 1940 4 coast defence ships; 1 destroyer; 21 torpedo boats, 9 of which are of the motor type; 4 submarines; 2 sloops; 2 minelayers and sundry smaller craft. Two cruisers were under construction in Italy.

Iran developed a small navy under Italian tutelage. This included 7 gunboats; 3 motor patrol vessels and one or two smaller units. Iraq had 4 patrol vessels, a yacht and a tug.

Manchoukuo, as a satellite of Japan, acquired 1 destroyer; 15 gunboats and 16 patrol vessels. Many of these are river craft.

Developments in naval design were perceptible as the result of the sea experience of the war. For instance, the tendency to augment the anti-aircraft armament of all ships, particularly those smaller craft which have been found to be most vulnerable

to air attack, was very marked. For bigger ships, additional deck armour will unquestionably be demanded in future. Other tendencies will doubtless become apparent as the war proceeds.

For convenience of reference, the table on p. 482 shows the strength in the principal categories of warships of the navies of the world at the end of 1940. (See also AIR FORCES; ARMIES OF THE WORLD; BLOCKADE; EUROPEAN WAR; MUNITIONS OF WAR; SUBMARINE WARFARE; TACTICS IN THE EUROPEAN WAR; UNITED STATES: *History*.) (F. E. McM.)

Nazis: see ANTI-SEMITISM; ARGENTINA; FASCISM; GERMANY; MINORITIES; SOUTH AFRICA, THE UNION OF.

Nebraska, one of the states formed from the Louisiana Purchase; area, 76,808 sq.mi.; population, 1940, 1,315,834; capital, Lincoln, 81,984. The largest city is Omaha, 223,844. In 1940 39.1% of the population was urban. In 1930, 1,355,702 were white, 13,752 Negroes, 1,262,617 native-born and 115,346 foreign-born.

History.—State officers for 1939-41 were governor, R. L. Cochran; lieutenant governor, W. E. Johnson; auditor, Ray Johnson, secretary of state, Harry R. Swanson; treasurer, John Havekost. In the election of Nov. 1940, Dwight Griswold became the new governor. In the presidential election, Willkie received 352,201 votes and Roosevelt 263,677.

Education.—Higher education is supported by the state at the University of Nebraska and in four teachers' colleges. The State university consists of ten colleges and three schools of collegiate grade. The total enrolment for 1939-40 was 12,268, of whom 8,756 were resident students of collegiate rank. Property and equipment are valued at \$12,473,548 and the biennial appropriation for 1939-41 was \$7,530,270 (including federal grants). The management of the university is vested in an elective board of regents. The four teachers' colleges offer collegiate training for four years leading to a bachelor's degree. The total enrolment in 1940 was 4,617 and the faculties numbered 205. Control is vested in a board of seven members. Elementary and secondary education is in the hands of local school districts of which there are now more than 7,200 in the state. Financial support is derived almost wholly from the local tax on property. The total enrolment in 1938-39 was 282,102 and the number of teachers employed was 13,791. School property was valued at \$82,706,968, school expenditures were \$20,319,467 and school indebtedness amounted to \$27,530,554.95 (1940).

Charities and Corrections.—The dependent, delinquent and defective classes are cared for in 17 institutions under the supervision of the State Board of Control. In addition to the penitentiary and reformatories for men and women, there are industrial schools for boys and girls, hospitals for the blind, the deaf and the feeble-minded, three hospitals for the insane, one home for soldiers and sailors, an orthopaedic hospital and a home for dependent children. The total institutional population in 1940

was 9,110 and the legislative appropriation for 1939-41, \$5,989. In addition there is an appropriation to the state assistance fund for the biennium 1939-41 of more than \$15,500,000. The fund is administered by a state assistance director in co-operation with the county boards.

Banking and Finance.—State banks under the supervision of the state banking department numbered 286 on June 30, 1940, decrease from 415 in 1933. These banks have resources of \$1,070,168. There were also 51 building and loan associations with resources of \$58,065,176 and 163 co-operative credit associations with assets of \$2,805,233. National banks at the same date numbered 135 with resources of \$284,167,000.

The total assessed valuation of the state for tax purposes was \$1,922,271,788. The tax rate for state purposes for 1940 is at 2.57 mills, which is calculated to produce \$4,940,238.50. The biennial budget for 1939-41 carried appropriations of \$52,000,000 of which about \$13,000,000 are federal funds. The chief sources of state revenue, aside from the direct tax on property, are tax on gasoline, motor vehicle licences, taxes on liquors, miscellaneous fees and licences. There is no state tax on personal or corporate incomes or on sales. The inheritance tax is collected by the counties. The state has no debt, though that of the local subdivisions in 1940 amounted to \$69,019,857.78. This does not include debts of the public power and irrigation districts amounting to \$60,000,000.

Agriculture and Manufactures.—Nebraska is an almost purely agricultural state and its chief products are from the soil. Its most valuable products are cereals and livestock. The normal production of corn is nearly 250,000,000 bu. and of hogs more than 5,000,000 annually. Other important crops are wheat, oats, hay, potatoes and sugar beets. Gross agricultural income in Nebraska, 1939: principal crops, \$53,367,000; livestock and products, \$165,707,000; total \$219,074,000; government products, \$28,078,000; grand total \$247,152,000.

The chief industries of the state are connected with the processing of farm products. The meat packing industry of Omaha involves 12 establishments, turning out products valued at \$10,419,614. Next in order of their importance come the processing of milk, flour, feed and mill products; car and car repairing, and such minor industries as confectionery, leather and harness, lumber and millwork and concrete products. In 1937, 24,480 persons were gainfully employed in 1,071 manufacturing establishments and the value of manufactured products was \$282,502,287.

(L. W. L.)

DWIGHT GRISWOLD, Republican, was elected governor of Nebraska Nov. 5, 1940

Necrology: see OBITUARIES.

Negroes (American). The civil rights struggle was again to the fore in 1940. The U.S. supreme court refused (Oct. 28) to review the circuit court ruling in the Alston case, ordering the city of Norfolk, Va., to cease salary differentials for teachers based on race, and the municipality agreed to an equalization budget. Salary equalization petitions were filed in Louisville, Ky., and the widened force of the high court ruling covered similar petitions elsewhere. The supreme court also set aside (Nov. 12) an Illinois decision to sustain a racially restrictive real estate covenant in the *Harvey* case, which although not passing directly on the constitutionality of such residential covenants, invalidates the type operative in the Chicago area affected. By congressional action on several defence bills, particularly aviation and vocational defence training, racial discrimination was forbidden, and in the former case, provision for the training of Negro personnel was expressly authorized; while by executive order (Nov. 1) the federal civil service rules were amended to include prohibitions

discrimination on account of race, the congress having previously passed a bill setting aside the requirement of photographs in civil service examinations. Following numerous protests of discriminatory exclusion from combatant and specialized branches of the armed forces, and a disputed public statement of policy, issued by the White House (Oct. 9), a supplementary statement of a revised policy to secure the more effective and equitable integration of Negroes into the armed forces was issued Oct. 25.

William H. Hastie appointed as civilian aide to the secretary of war and Major Campbell C. Johnson assigned to the director of selective service to be "actively concerned with these further developments of policy." It had been pointed out that Negroes constituted only 1.5% of the regular army personnel (4,451 out of 29,636), and were by custom excluded from many branches of the ranks in the service, in the air, marine corps and in the navy except as mess attendants. Oct. 25, Col. Benjamin O. Davis was appointed on presidential nomination to the highest active service rating yet attained by a Negro—brigadier-general. War department reports show Negro officer personnel available in the regular reserve of 353, R.O.T.C. graduates 554, and R.O.T.C. personnel totalling 4,926, with over-quota registration in the new limited aviation and vocational defence training openings.

Absorption of Negroes back into industry from the unemployed and relief ranks was still disproportionately slow, owing to discrimination and relative lack of labour union protection. In the south, the agricultural situation did not improve and a major economic crisis impended, especially for the Negro tenant farmer and farm labourer. In urban areas, the more extended operation of the wages and hours legislation brought about considerable improvement both in hours and wages. Considerable areas of Negro labour were not, in 1940, yet so protected—domestic service and farm labour. A. Philip Randolph, pioneer Negro labour leader, former president of the National Negro congress, resigned on a split with alleged radical domination of the central committees of that important clearing-house organization. The National Association for the Advancement of Colored People, specializing in the legal civil rights and the anti-lynching campaign, announced with the Chicago (Hansberry) decision its 17th annual supreme court victory. The National Urban league celebrated November its 25th anniversary; and the Association for the Study of Negro Life and History similarly celebrated its 25th in September.

Educational and Cultural.—The *Crisis* annual survey of education reported 3,913 Negro college and professional graduates out of a total of 33,340 college students; 30,890 of these enrolled in Negro colleges. Twelve doctoral degrees; 40 Rosenwald fellows in various fields of science, social science, art, music and education; one Guggenheim fellowship (creative sculpture) and the publication of notable books (see *Bibliography*) showed steady progress in the research scholarship and creative art. During July–August an extensive commemorative exposition of 75 years of progress since emancipation was held at the Chicago Coliseum under the auspices of the state of Illinois, with assisting U.S. subsidy, and in December an extensive exhibit of art, historical documents and a week's festival of Negro music commemorated in Washington the 75th anniversary of the 13th amendment under the auspices of the Library of Congress. The art exhibits at both places showed the rapid spread and progress of the pictorial and plastic arts among younger generation Negroes, much of it due to sponsorship and widened facilities of the Federal Art project. Richard Wright published his sensational social novel, *Native Son* (Book of the Month choice and sales of over 250,000 copies). Dorothy Maynor, vocal find of 1940, was awarded the Wyn Hall Endowment Series medal; while Charles Holland, soprano, Virginia Lewis, soprano and Louise Burge, contralto, came

to wide public notice, the latter as soloist with the N.Y. Philharmonic and the Schola Cantorum in the première at the Lewisohn stadium, July 25, of William Grant Still's choral ballad, *And They Lynched Him to a Tree*, poem by Katharine Chapin Biddle. Negro achievement was celebrated at the N.Y. world's fair with a special week, July 23–28, and 41 inclusions of Negroes occurred in the American Hall of Fame listings of *The American Common* at the fair. The Katharine Dunham dancers, inaugurating one of the first recognized repertoires of Negro ballet, after recital successes, were incorporated in the cast of the outstanding Ethel Waters' musical comedy success, *The Cabin in the Sky*. Hattie McDaniels was awarded the best supporting character Motion Picture Academy award for her role in *Gone With the Wind*, and Ben Johnson, former Columbia track captain, was awarded the Harrison K. Bird medal as the outstanding Columbia university track athlete for the decade 1930–40.

Hampton institute inaugurated a new president, Malcolm MacLean, and a progressive revision of their educational program with a widely representative Hampton conference on the Negro and National Defence.

The year's obituary included Marcus Garvey, June 10 in London at the age of 53; Robert L. Vann, age 61, proprietor-editor of the largest Negro newspaper, *The Pittsburgh Courier* and former assistant to the U.S. attorney-general, Oct. 24 at Pittsburgh; Sergt. George H. Wanton, only living Negro holder of the Congressional medal, Nov. 27 at age 73 in Washington, D.C.; Robert S. Abbott, founder-owner of the *Chicago Defender*, pioneer in nationwide Negro journalism, Feb. 29, in Chicago; James C. Napier, prominent reconstruction politician and former registrar of the U.S. treasury, April 27 at Nashville, Tenn.; Robert R. Moton, immediate successor of Booker T. Washington as president of Tuskegee institute, May 31 at Capahosic, Va.; Bishop W. A. C. Hughes, July 12 in Baltimore, a few weeks after his election, along with Lorenzo H. King, as one of the two new Negro bishops of the Methodist Episcopal church.

Nelson, Donald Marr (1888–), U.S. business executive, was born Nov. 17 at Hannibal, Mo. and was graduated from the University of Missouri in 1911. The next year he was employed by Sears, Roebuck and company as a chemical engineer. In 1927 he was appointed general merchandise manager of the company, in 1930 vice-president in charge of merchandising, and in 1939 executive vice-president and chairman of the executive committee. He is a director of *Encyclopædia Britannica*.

On May 29, 1940 Nelson was appointed full-time acting director of the U.S. treasury's procurement division. On June 28 he was named co-ordinator of national defence purchasing in co-operation with the advisory commission of the Council of National Defence. Four months later he became head of the commission's priorities division. In the reorganized "super-defence" board (Office of Production Management), created Jan. 7, 1941 by President Roosevelt, Nelson was appointed executive director of the division on purchases and thus assumed complete responsibility for buying billions of dollars of material for the defence program.

Neoprene: see CHEMISTRY; CHEMISTRY, APPLIED.

Nepal, an independent kingdom (area c. 54,000 sq.mi., est. pop. 5,600,000) lying between India and Tibet—and in-

cluding Mt. Everest—ruled in fact by the prime minister (hereditary), Maharajah Sir Joodha Shamsher Jung Bahadur Rana. The country exports rice, jute, oilseeds, hides and especially timber, and imports cotton, textiles, metals, salt, sugar, etc. It maintains the closest association with British India, both in commerce and in the provision of recruits for the fine Gurkha regiments of the Indian army. Since the outbreak of war in Europe 8,000 Gurkha troops were offered for the garrison of India. Nepal has, in addition, subscribed liberally to the various war funds.

In May 1940 the marriage took place of the crown prince (1920–) to a granddaughter of the prime minister. The British envoy, Lt. Col. G. L. Betham, C.I.E., M.C., resides at the capital, Khatmandu (pop. c. 80,000).

Nervous Diseases: see MEDICINE; PSYCHIATRY.

Nervous System. The announcement of the importance of vitamins in maintaining the function of the nervous system has had wide influence in changing our pessimistic concept of therapy of the so-called degenerative diseases. Pathologic changes in the central nervous system not due to tumours or infections were in 1940 optimistically treated with vitamins. Various forms of neuritis were successfully treated by vitamin B₁ (thiamin) as were also certain central lesions. Local pains produced by mechanical bony pressures, neuralgias and headaches were also treated by this vitamin, but enthusiastic reports required confirmation. Vitamin B₆ (pantothenic acid) was reported successful in treating dystrophic muscular conditions and vitamin E (tocopherol) had favourable mention in the treatment of muscular atrophies. If scientific research confirms these tentative reports the development of thousands of helpless cripples in the future may be prevented.

Other successful chemotherapy has also been reported. Quinine was considered in 1940 efficient in relieving tonic muscle spasms in certain peculiar dystrophic muscular conditions (myotonia congenita and dystonia). Sulphanilamide continued to save victims of streptococcus meningitis; sulphapyridine was efficient in the treatment of pneumococcus meningitis.

Pharmacologic shock therapy in the psychosis spread to most clinics and state hospitals. The results of insulin shock in schizophrenics finally proved to be temporary and latest statistical studies revealed no greater percentage of remissions than occur spontaneously. Beneficial effects of metrazol convulsive shock therapy on melancholia and depressions were unquestioned. Psychoses are shortened from years to a few weeks. There was still doubt whether cerebral damage is not also a result of the treatment. Curare was used preliminary to metrazol for the purpose of decreasing the convulsive seizures. An electrical method was used which produces a convulsive seizure when current is passed

through the head. The seizure is less violent than that produced by metrazol and there is no anxiety on the part of the patient because there is an amnesia for the treatment.

Benedeck and Rubinstein in *Psychosomatic Medicine* (1939) made extremely important studies on the relation of ovarian cycle in women to their emotional trends. This scientifically confirmed hypotheses long held in dynamic psychology that changes in energy gradients arising from activities of glands of internal secretion affect psychic tensions. With other researches in psychosomatic medicine psychogenesis of physical disturbances was becoming clearer and indicative of possible therapy and pre-morbid prophylaxis. (See also ENDOCRINOLOGY; MEDICINE; PSYCHIATRY; VITAMINS.) (R. R. G.)

Netherlands, kingdom of northwest Europe, member of the League of Nations. Bounded N. by the North Sea, E. by Germany, S. by Belgium and W. by the North Sea. Ruler, Queen Wilhelmina (born, 1880; succeeded, 1890; crowned, 1898); president of the council of ministers: Prof. P. S. C. van der Lubbe. National flag, red, white and blue, in equal horizontal stripes.

Area and Population.—The area 13,440 sq.mi.; pop. (Dec. 31, 1938) 8,728,560. Chief towns (pop. Dec. 31, 1938): Amsterdam (commercial cap. 793,526); Rotterdam (612,322); The Hague (political cap. 495,518). Language: Dutch; religion: Christian (1930 census: Dutch Reformed Church: 2,732,333; Roman Catholic: 2,890,022).

History.—The Netherlands, which had pursued a policy of strict neutrality during the first part of the European conflict, were attacked by Germany on May 10, 1940. The attack had begun without Germany attempting to produce even a single justification. Three hours after the outbreak of hostilities the German minister visited the ministry of foreign affairs to communicate on behalf of his government that Berlin had learned of aggressive plans of the Allies against Germany, worked with the knowledge of the Netherlands and Belgium. To the representation of the facts, coupled with several acts of aggression, only one reply could be given: The Netherlands considered themselves at war with the German Reich.

It may certainly be called a success for the Dutch forces that the German operations against the heart of the country achieved their end only on the fifth, instead of the first or second day. (See EUROPEAN WAR.) Thanks to this bitter resistance it was possible for the queen and the government to leave the country. When the military situation made further resistance on land useless, the Dutch naval forces in the north and the centre were ordered to leave the Dutch coasts as soon as possible for England, to continue the fight from there.

From the beginning the German forces openly set out to humiliate the queen. When in the early morning of May 13 the military situation had grown so grave that the fall of the fortress of Holland

DUTCH PRISONERS OF WAR lined up in May 1940 outside the fortress they had defended only a few hours before

to be seriously reckoned with, it became imperative to prevent the queen and the government from falling into the hands of the enemy. The Dutch queen was able to leave the country that morning. In the evening she was followed by the members of the government in a British warship. The next day, the Netherlands commander-in-chief issued an order of the day to his troops and to the civilian population in which he told them of the capture of the queen and the government and explained that it had become necessary on account of the critical military situation of the fortress of Holland.

At the same time General Winkelman stated that the government had instructed him to continue fighting till the moment when further fighting should become useless and had delegated the necessary powers to him.

In accordance with these instructions the commander-in-chief immediately entered into negotiations with the enemy. This meant that the kingdom of the Netherlands under the leadership of the head of state and the constitutional government remained at war with Germany. The cessation of hostilities in the Netherlands had only military and a local significance.

The Netherlands continued the war at the side of their allies by those means which they still had at their disposal. Among these there was first of all the navy which had already resumed active service; next to that the immense economic resources of the overseas territories and the relatively large merchant marine. Together these factors formed no mean contribution to the Allied effort.

After May 15 the Netherlands government was temporarily domiciled in England from where the Dutch queen and her ministers were carrying on the government of the Netherlands territory in the East Indies, and in Surinam, Curaçao, Aruba and the other Dutch islands in the Caribbean sea, and the promotion of the Netherlands' political, economic and cultural interests all over the world.

The royal Netherlands government offices in London comprised the established departments; from them there was regular contact with the Dutch diplomatic and consular posts and close co-operation with the loyal governments of the Netherlands overseas territories with rulings on matters of general policy and on many economic and commercial questions.

The Dutch mercantile marine did not fall into the hands of the enemy and continued to ply the seas between the Netherlands overseas territories and all parts of the world in the interests of the Netherlands, while a million tons of shipping space were time-chartered to the British government in the interest of the Allied cause. These matters were being managed by the Netherlands Shipping and Trading Committee Ltd., London, a body instituted by the Netherlands government and acting in close co-operation with Dutch and British authorities.

Legislation was being carried on by the Dutch queen, in connection with the cabinet, in order to safeguard Dutch interests all over the world and more especially the interests in foreign countries of the residents in occupied Holland.

Nearly all important Dutch companies, however, which normally operated from the Netherlands, had their headquarters moved to the overseas territories where the government appointed new managing directors.

A Dutch legion was formed in England soon after the invasion; in Aug. 1940 all able-bodied Dutchmen between the

ages of 20 and 36 were called up for military service.

Education.—In 1938: elementary schools 7,812; scholars 1,242,778; secondary schools 288; scholars 62,301; high schools (1937-38) 4; scholars 3,037; universities (1937-38) 6; scholars 9,471.

Banking and Finance.—Revenue, ordinary (est. 1939), 602,153,493 florins; expenditure, ordinary (est. 1939), 744,732,786 florins; public debt (Dec. 31, 1938), 3,986,628,806 florins; notes in circulation (July 31, 1939), 1,036,976,000 florins; gold and silver reserve (July 31, 1939), 1,153,448,000 florins; exchange rate (average 1938), 8.89 florins=£1 sterling; (July 31, 1939) 8.82 florins=£1 sterling.

Trade and Communication.—Overseas trade (merchandise) 1938: imports 1,414,768,000 florins; 1939: 983,450,000 florins; exports, 1938: 1,039,156,000 florins; exports, Jan.-Aug. 1939: 703,710,000 florins. Communications and transport 1938: roads suitable for motor traffic 16,000 mi.; railways, open to traffic 2,016 mi.; rivers and canals, navigable 4,817 mi.; airways, distance flown 6,629,000 mi.; shipping (June 30) 2,855,400 gross tons; launched (July 1938-June 1939) 246,400 gross tons; entered with cargoes 27,606,524 net tons; cleared with cargoes, 23,151,428 net tons. Motor vehicles licensed (Aug. 1, 1938): cars 94,000; buses 4,088; trucks 50,988; cycles 55,140; wireless (June 30, 1939): registered receiving sets 839,542; connections with radio-distributing-systems 368,710.

(H. F. D. B.)

Netherlands Colonial Empire.

Total area (approx.)

845,800 sq.mi.; total

pop. (est. Dec. 31, 1938) 76,401,000.

The table lists the colonial possessions of the Netherlands, together with statistics appropriate to each of them, including the mother country. (X.)

History.—The Netherlands Indies, Surinam and Curaçao were in 1940 continuing their existence much as usual, although the army and navy had been mobilized and strengthened since May and a great deal of emergency legislation had been necessary. There was a wonderful display of loyalty to the queen and of sympathy with the misfortunes of the mother country from the whole community, natives and Chinese no less than Europeans.

Although the East Indies were in very difficult economic straits themselves, a voluntary subscription of funds realized £1,000,000 within a few months, the major part of which was destined for the purchase of 50 Spitfires and 18 Lockheed bombers to be used for the common cause.

There was at the close of 1940 a naturally serious concern in the Netherlands Indies in connection with the unstable condition of affairs in the far east and everything was being done to speed up land, sea and air defences in order to be able to meet any emergency. (H. F. D. B.)

Colonial Possessions of the Netherlands and Essential Statistics

Country and Area, sq. miles (approx.)	Population est. Dec. 31, 1938 (000's omitted)	Capital	Status	Governors, Premiers, etc.
NETHERLANDS	13,120	The Hague	kingdom	Ruler: Queen Wilhelmina Premier: Professor P. S. Gerbrandy
ASIA				
NETHERLANDS INDIES, including Java and Madura, Sumatra, Celebes, Borneo (D.), New Guinea (D.), Timor (D.), etc.	774,600	Batavia	colony	Governor-General: Jonkheer Dr. A. W. L. Tjarda van Starkenborgh-Stachouwer.
AMERICA

SURINAM (Dutch Guiana)	57,700	Paramaribo	colony	Governor: Dr. J. C. Kielstra.

Neutrality. **Inter-American Problems.**—The close of the year 1939 was marked by the battle between British warships and the German pocket battleship "Graf Spee," followed by the scuttling of the German ship off the port of Montevideo. In answer to the formal protest of the 21 American republics against this violation of the "security zone," the British government replied on Jan. 14, 1940, insisting that it could not abandon its legitimate belligerent rights unless it were given assurance that the adoption of the zone would not provide German warships with "a vast sanctuary" from which they could emerge to attack its shipping and into which they could retire to escape pursuit. The French government replied in like effect. The German government insisted that the British and French possessions on the American continent gave those powers a position of advantage which impaired the effect of the security zone from the outset. Following closely upon these replies came the case of the German freighter "Wakama," which was sunk by its own crew on Feb. 12 off the coast of Brazil when summoned to stop by a British war vessel. Again on March 9 the German merchant vessel "Hannover" was scuttled by its own crew off the coast of the Dominican Republic on being intercepted by a British war vessel apparently for purposes of search and capture. In both cases the American republics, acting through the president of Panama, entered a collective protest to Great Britain; but no further action was taken.

In the meantime the Inter-American Neutrality committee, which had been created at the meeting of foreign ministers at Panama in 1939, began its sessions on Jan. 15. On April 27 it presented a formal recommendation on the security zone, pointing out the legal arguments in justification of the zone and proposing that in the event of future violations of the zone the American republics should appoint a committee to determine which of the belligerents took the initiative in the conflict and should deny the privileges of their ports to the ships of that belligerent. Other recommendations of the committee dealt with internment, submarines, auxiliary transports, telecommunications and the inviolability of postal correspondence. On this last subject the committee sought to take account of the claim of the belligerent to search for contraband by recommending that epistolary correspondence be separated from other kinds of mail and be limited to letters and business papers, which must not contain bank notes or other papers of value to the bearer, gold, jewels or other merchandise. At the meeting of foreign ministers held at Havana, July 21-30, the work of the neutrality committee was extended to include the drafting of an inter-American convention covering the whole field of international law in respect to neutrality, in addition to other concrete problems of more immediate concern. No action was taken by the meeting with respect to the "security zone," other than to renew the condemnation of hostilities within the zone and to instruct the neutrality committee to prepare a preliminary draft of a convention dealing with the juridical effects of the zone and the measures of co-operation which the American states might be ready to adopt to obtain respect for it.

European Problems: The "Altmark" Case.—On Feb. 16 a British cruiser attacked the German auxiliary transport, "Altmark," in neutral Norwegian territorial waters. On board the "Altmark" were some 300 British officers and men belonging to various British merchant vessels which had been captured and sunk by the German warship "Graf Spee." The Norwegian government protested against the violation of its neutrality, insisting that the "Altmark" had the right to navigate through Norwegian territorial waters. The British government, in reply, justified the rescue of the prisoners on the ground that the Norwegian authorities had refused to conduct a search of the vessel to deter-

mine if there were prisoners on board; and at the same time asserted that German warships should not be permitted to make use of Norwegian waters as a means of escaping capture. A month later the British government undertook to intercept German traffic by laying mines at certain points within what is described as the "covered way" of Norwegian territorial waters.

The Invasion of Norway and Denmark.—On April 9 Germany simultaneously invaded the neutral territories of Norway and Denmark. Denmark yielded almost without resistance. Norway sought to defend itself, and Great Britain sent naval forces to its aid. Within a few weeks, however, Norway was overrun by German troops. On April 13 President Roosevelt denounced the "unlawful exercise of force" against the two small nations which had always observed "the highest standards of national and international conduct." At the same time the resistance of Norway led the president to decide that a "state of war" existed between Norway and Germany, calling for a proclamation of neutrality on the part of the United States and the application of the laws and regulations connected with neutrality. The coast line of Norway was now included in the "combat area" from which American vessels were excluded. The proclamation was not extended to Denmark.

The Invasion of Holland, Belgium and Luxembourg.—Following the invasion of Holland, Belgium and Luxembourg on the night of May 9-10, President Roosevelt, on May 11, included these three countries under the terms of a single proclamation of neutrality, applying to them as to Norway the terms of the neutrality laws and regulations. This, however, did not prevent the president from stating in a public address on May 10 that the "crimes of invasion" of those countries had "shocked and angered the people of the United States." At the same time the president issued an executive order "freezing" the credits of Norway, Denmark, Holland, Belgium and Luxembourg in the banks of the United States so as to prevent any temporary governments that might be set up in those countries from drawing upon them. On May 19 the American republics, acting upon a proposal of the government of Uruguay, based upon a resolution adopted at Panama in 1939, put forth a joint declaration protesting against the "unjustified and ruthless violation by Germany of the neutrality of Belgium, Holland and Luxembourg."

The government of Argentina had proposed that the American republics abandon the status of "neutrality" in favour of that of "nonbelligerency"; but the United States government replied that it knew of no legal status between neutrality and war.

Reaction to the Defeat of France.—The swiftness and ruthlessness of the German advance through Holland and Belgium and the imminent peril to France and Great Britain caused immediate reactions in the policy of the United States and marked the beginning of a succession of acts which could not be justified by the technical law of neutrality. On June 10, following the entrance of Italy into the war, President Roosevelt, in a public address at the University of Virginia, went further than formal protest. After describing the efforts of the government to maintain peace in the Mediterranean area, he made the bitter remark that "the hand that held the dagger" had "struck it into the back of its neighbour." Nevertheless, on the same day, the usual proclamations and regulations were issued concerning the neutrality of the United States between Italy and the Allies. On June 15, however, in answer to the appeal of Premier Reynaud of France for help, the president stated that the government of the United States had already "made it possible for the Allied armies to obtain during the weeks that have just passed aeroplanes, artillery and munitions of many kinds," and that so long as the Allied governments continued to resist, the government of the U.S. would "redouble" its efforts in this direction. The reference of the pre-

was in part to the surplus government stores which had been to the Allies by the contrivance of returning the guns and material to the manufacturers who then, in their capacity as private citizens, sold them immediately to the Allies. The indirect method of transfer was clearly an evasion of the duty of the neutral government not to furnish supplies to either belligerent, its justification must be placed upon other grounds than the principle of neutrality.

The Defence Pact with Canada.—On Aug. 18 President Roosevelt and the prime minister of Canada, W. L. Mackenzie King, announced that after discussion of mutual problems of defence in relation to the safety of Canada and the United States had been agreed to set up a permanent joint board of defence. This was equivalent to an informal defensive alliance between the two countries; and while it was in keeping with the policy announced two years earlier by the United States, it was not consistent with the position of neutrality still maintained by the United States in principle. The fact that it was justifiable as a necessary extension of the Monroe Doctrine did not change the character of the act in respect to the international law of neutrality.

Acquisition of Naval Bases in Exchange for Destroyers.—Apparently inconsistent with neutrality, if otherwise justifiable, was the bargain with Great Britain by which the United States accepted 99-year leases in British possessions extending from Newfoundland to British Guiana in return for the transfer to Great Britain of 50 over-age destroyers. In both instances it was asserted that the United States would use the bases as part of its system of national defence against contingencies arising in the event of a German victory. The transfer of the destroyers raised difficulties in respect to a number of statutes having as their object the defence of the United States and the maintenance of neutrality. The chief stumbling block was the act of June 15, 1917, sec. 3 of which made it unlawful to send out of the jurisdiction of the United States, when neutral, any vessel built, armed or equipped as a vessel of war, with any intent or under any contract that the vessel should be delivered to a belligerent nation, without reasonable cause to believe that the vessel would be employed in the service of a belligerent after its departure from the United States. The attorney general gave an opinion holding that the statute was directed against vessels built to the order of a belligerent, and that in consequence it would prohibit the transfer of certain smaller "mosquito" boats, which it was proposed to transfer with the destroyers, but would not apply to the destroyers themselves, since they had not been built to the order of Great Britain. This interpretation was held to be justified by sec. 2 of the same act which gave to the president the power to detain privately-owned armed vessels in port only when the owner could not prove that they would not be sold or delivered to a belligerent within the jurisdiction of the United States on the high seas—terms which appeared to indicate that the prohibition against sending vessels out of the jurisdiction of the United States was not intended to be absolute, but to apply only to vessels built to the order of a belligerent.

Neutrality and the Right of Self-Defence.—The opinion of the attorney general sought to reconcile the transfer of the destroyers to Great Britain with the obligations of the United States under the international law of neutrality by arguing that what international law forbade was the building of armed ships to the order of a belligerent, not the sale or delivery to a belligerent in a foreign port of armed vessels already built, in line with the provisions of the act of 1917 which had been passed to meet the obligations of the United States. But the transfer was justified by international lawyers on broader grounds. The invasion by Germany of Norway, Denmark, and Belgium and Luxembourg had, it was argued, undermined the foundations of neutrality and made all other states realize that their neutrality was in itself no guarantee that they could escape being drawn into the war. Hence it became necessary for them to take what measures could for their own defence. If these measures were inconsistent with the normal status of neutrality, they were justified by the right of every state to defend the principle of law upon which the obligations of neutrality

rested, namely, the observance by belligerents of the acknowledged rights of neutrals. Moreover, it was well established in international law that a neutral state, when wronged by a belligerent, might resort to such reprisals as the gravity of the offence appeared to warrant. Germany, it was argued, had at the very outset of the war violated the Kellogg pact and given just ground even then for measures of reprisal by the United States. The subsequent violations by Germany of the neutrality of its small neighbours merely added to the gravity of its original offence; while the military successes of Germany only served to bring home to the United States the threat to its own national interests from the general breakdown of law and order. Under such circumstances the United States was not only justified in refusing to give Germany the benefit of the observance of neutral duties, but might go further and give to the Allies such material aid as it believed proper without losing thereby its status as a neutral, unless Germany chose to take the initiative in declaring war.

Neutrality in Transition.—The signing by Japan on Sept. 27, 1940, of a tripartite defensive alliance with Germany and Italy marked the abandonment by Japan of strict neutrality, without, however, making Japan a belligerent. So also the acceptance by Rumania in October of a form of German protectorate took that state out of the group of those still technically neutral, and led to a proclamation by the president "freezing" the credits of Rumania in banks of the United States. On Oct. 28 the government of Greece announced that it regarded the Italian ultimatum as equivalent to a declaration of war. Hostilities broke out immediately, but it was not until Nov. 15 that President Roosevelt proclaimed the neutrality of the United States between Italy and Greece and extended to Greece the regulations already in force against Italy. On Nov. 20 Hungary formally joined the three-power pact between Germany, Italy and Japan. Egypt continued to remain neutral in spite of Italian attacks upon Egyptian territory. Eire (Irish Free State), in spite of being a member of the British commonwealth, continued to maintain its neutrality in spite of urgent appeals from the British government that the royal navy be permitted to use ports on the west and south coasts of the country. (See also INTERNATIONAL LAW; LEAGUE OF NATIONS; PROPAGANDA.) (C. G. FK.)

Nevada, Emma (1862–1940), U.S. operatic soprano, was born in Austin, Nev., the daughter of Dr. W. W. Wixom. She early displayed musical talent and began to study in Oakland, Calif., when she was eight years old. Later she studied under Marchesi in Vienna. When she began to appear in opera she assumed the name Nevada, after her native state. She sang leading parts in many European cities and made her American debut in 1884. She married Dr. Raymond Palmer of London in 1885.

Her admirers ranked her with Patti. She died in Liverpool, England, on June 20.

Nevada, admitted into the union on Oct. 31, 1864, has two popular names, the "Sagebrush" and the "Silver State"; land area is 109,821 sq.mi., water area is 869 sq.mi., total area is 110,690 sq.mi.; population according to the U.S. census of 1940 is 110,247.

Capital, Carson City, 2,478. Reno, population 21,317, stands in 474th place among the cities of the U.S. Of the state's population 39.3% are urban as compared with 37.8% in 1930; in 1930, 89.4% of the population were white; 6.6% Indian; 3.4% Mexican or oriental; and .6% Negro. About 83.4% are native born and 16.6% are of foreign origin.

History.—The Democratic vote for Franklin D. Roosevelt in the 1940 presidential election was 31,945, the total vote for Wendell L. Willkie, Republican nominee, was 21,229. Outstanding events of the year 1940 were the election on Nov. 5, closely followed by the death of Key Pittman, for 26 years United States senator for Nevada. Pittman, again elected for a six-year term, died in Reno on Nov. 10, after a brief illness. The electorate approved the following amendments to the state constitution: All licence fees and gasoline tax fees paid by motor vehicles were to be expended for public highway work in Nevada. The second amendment denied the legislature the power to abolish any county in Nevada unless the voters of the county affected shall first approve such abolishment.

The principal state officials were: governor, E. P. Carville; lieutenant governor, Maurice J. Sullivan; secretary of state, Malcolm McEachin; attorney general, Gray Mashburn; state treasurer, Dan W. Franks; state controller, Henry C. Schmidt; surveyor general, E. W. McLeod; mine inspector, Matt Murphy; state highway engineer, Robert A. Allen; U.S. senators, Pat Mc-

Carran and Berkeley L. Bunker; U.S. representative in congress, J. G. Scrugham. Chief justice of the supreme court is E. J. L. Taber; associate justices are Edw. A. Ducker and William E. Orr.

Education.—The University of Nevada in Reno had an enrolment of 1,267 during the year 1939-40, composed of 787 men and 480 women; enrolment as of Jan. 1, 1941, was 1,142, composed of 718 men and 424 women. In 1940 there were 249 elementary schools, 14 kindergartens and 45 high schools in Nevada, staffed by 633 elementary teachers, 14 kindergarten teachers and 268 high school teachers. The total enrolment of school children was 20,746, an increase of 10%.

Banking and Finance.—The state of Nevada has a treasury surplus and has no bonded debt outside the state and has never defaulted a bond issue. The state tax rate declined over a period of years. The state always keeps within its budget. As of June 30, 1940, the Nevada treasury surplus broke down into the following terms:

Net cash available in treasury	\$1,617,183.41
Balance between investment and indebtedness	3,170,752.86
Department revolving funds	43,800.00
	\$4,831,736.27

The total resources of the 11 insured commercial banks in Nevada totalled \$44,694,000 in 1940 and deposits were listed as \$40,810,000.

Agriculture and Mineral Production.—According to the U.S. farm census there were 3,696 farms in Nevada. The state had a total farm acreage of 3,621,769 acres. The number of cattle on Nevada ranges were 360,000 beef cattle; 21,000 dairy cows; 23,000 swine; and 840,000 sheep; horses totalled 39,000 and mules 2,000. Agricultural production as of Jan. 19, 1941: Corn 120,000 bu.; wheat (19,000 ac.) 483,000 bu.; oats (7,000 ac.) 280,000 bu.; barley (15,000 ac.) 540,000 bu.; hay (325,000 ac.) 534,000 bu.; potatoes (2,300 ac.) 391,000 bushels.

The mineral production for 1940, stimulated by the increased demand for metals, showed an increase over the totals for the year 1939. Activity was noticeable in properties producing antimony, chromium, manganese, mercury, nickel, tin and tungsten.

The U.S. bureau of mines reported that metal mining in Nevada for the year 1940 gave a total production of gold, silver, copper, lead and zinc valued at \$35,876,782, exceeding that of any year since 1918. Copper displaced gold as Nevada's most valuable mineral product in 1939, but the output did not equal either in quantity or value the mark set in 1937.

Gold production exceeded that for any year since 1916. In 1939, 891 lode mines and 104 placer mines produced 361,518 fine ounces of gold valued at \$12,653,130; 4,316,029 fine ounces of silver valued at \$2,929,668; 133,194,000 lb. of copper valued at \$13,456,000 and zinc valued at \$647,712. (E. C. D. M.)

Newbery Medal: see AMERICAN LIBRARY ASSOCIATION.

New Brunswick, one of the original provinces which united to form the dominion of Canada in 1867; area 27,985 sq.mi.; population, according to the dominion census of 1931, 408,219; estimated Jan. 1, 1941, 451,000. Capital, Fredericton, 8,830. The only other cities are Saint John, 47,514, the most important port, and Moncton, 20,689, the main divisional point of the Canadian National railway in the maritime provinces. Of the province's population 263,432 are rural, or 64%; 403,049 are Canadian born or nearly 99%. The present government assumed office in 1935 as the result of a liberal victory over the conservatives.

The lieutenant governor, who is appointed by the dominion government for a term of five years, is W. G. Clark. The premier and minister of public works is A. A. Dysart.

The enrolment in the public day schools was (1940) 92,773,

in private day schools 2,954. There are two universities in the province, the University of New Brunswick, which is financed and controlled by the government and has an enrolment of 3, and Mount Allison university with an enrolment of 430. The estimated wealth (1940) of the province was \$730,297,000; wealth per capita \$1,739. The net value of manufactured products in 1938 was \$31,578,262, a slight increase over 1937. The gross value of agricultural products in 1938 was \$27,473,000.

Newfoundland and Labrador. Area: Newfoundland 42,000 sq.mi.; Labrador 110,000 sq.mi.; total 152,000 sq.mi.; pop. (est. Dec. 1, 1938): Newfoundland 290,660; Labrador 4,780. Chief town (capital, pop. est. 1938): St. John's (41,000). Governor: Humphrey Walwyn; language: English; religion (1935 census): Roman Catholic 93,925; Church of England 92,732; United Church 76,100; Salvation Army 18,054.

History.—The island of Newfoundland off the east coast of Canada, which has sovereignty over the mainland area of Labrador, is a British dominion with its government as such in session since 1933. It is administered by a commission of government instituted by the imperial government.

The reconstruction program outlined by J. H. Penson, the commissioner for finance, in July 1939 was much curtailed in account of the war and the resulting substantial reduction in expenditure coupled with the increased taxation put the finances of the country on a firmer footing and not only relieved it of the necessity of calling on the mother country to meet the annual deficit but enabled it to make large contributions to the empire's war effort, including the provision of funds for fighter aircraft. A war loan of \$1,500,000 at 3½% redeemable in 25 years was issued at par in June and almost immediately oversubscribed, and in addition to such financial help Newfoundland provided a constant flow of volunteers for all branches of the fighting services and for logging. Two regiments of royal artillery were formed, some 3,000 trawlermen—with a number of trappers—joined the navy, mainly for minesweeping, and 500 the merchant marine; and over 2,500 lumberjacks worked for the ministry of supply in the state forests of England, Scotland and Wales.

In conformity with the proposal announced by Mr. Churchill in the house of commons on Aug. 20 to lease to the United States sites for naval and air bases for the defence of the U.S. Atlantic seaboard, facilities for the establishment of such bases on the south coast and the Avalon peninsula were granted, and in November work was begun on the first of these, in Placentia bay.

It was announced in July that the term of the governor, who was due to expire in Jan. 1941, had been extended for a year.

Banking and Finance.—Revenue, ordinary, 1939-40 (actual) \$11,641,700, 1940-41 (est.) \$13,400,000; expenditure, 1939-40 (actual) \$19,249,640, 1940-41 (est.) \$15,548,000, including \$1,532,000 for special reconstruction work; public debt (June 30, 1939) sterling £20,382,869; notes in circulation (June 30, 1939) \$24,023; exchange rate as Canadian dollar.

New Guinea: see DUTCH EAST INDIES; MANDATES; PACIFIC ISLANDS, MANDATED.

New Hampshire, one of the New England group of states and one of the original states of the United States.

es, popularly known as the "Granite State"; area, 9,282 sq. mi.; population (U.S. census 1940) 491,524, representing an increase of 26,231 or 5.6% over population in 1930. Capital, Concord, 27,171. Other cities with populations exceeding 15,000: Manchester, 77,685; Lowell, 72,927; Berlin, 64,844. Of the state's population 283,225 or 57.6% are urban. In 1930 there were 464,350 persons, of which 381,690 were native born and 82,660, foreign born. Immigrant foreign-born elements were: United Kingdom, 11,539; French Canadians, 37,682; other Canadians, 13,277. During the decade from 1930 to 1940 New Hampshire's population grew faster than the urban, reversing the trend from 1920 to 1930.

ROBERT O. BLOOD was elected Republican governor of New Hampshire Nov. 5, 1940

History.—Governor, Robert O. Blood (elected in Nov. 1940); secretary of state, John D. Fuller; state treasurer, F. Gordon Kimball; commissioner, Charles F. Bowen; attorney general, Frank R. Mason (all Republican). U.S. Senators from New Hampshire: H. Styles Bridges and Charles W. Tobey (both Republican). Congressmen were Arthur B. Jenks and Foster Stearns (Republican). In the general court in 1941 were 12 Republican senators, 10 Democratic, and 3 elected by both parties. The house of representatives included 229 Republicans and 194 Democrats. While the state government was controlled by Republicans as a result of the election of 1940, yet New Hampshire was carried for Wendell L. Willkie. The general court convened for its 163rd session on Jan. 1, 1941. During the year 1940 the state supreme court by a vote of 3 to 2, held constitutional the sales tax on liquor levied by the legislature at its last session, thus marking a shift in the opinion of the court regarding the taxation of single commodities. The revenue from this tax made it unnecessary to enact any state property tax. During 1940 the state completed a flood control and conservation project on the Connecticut river at Pittsburg, while the war department began the construction of flood control projects at Surry mountain on the Ashuelot river, at Webster on the Blackwater river, and at Franklin Falls on the Pemigewasset.

Education.—Data available show that there were in New Hampshire some 1,941 public schools, including 103 approved independent high schools; 16 public academies approved as high schools; 5 accredited private academies; 612 private schools; and teachers' colleges, at Plymouth and Keene. There were also five institutions of higher education: University of New Hampshire, Durham; Dartmouth college, Hanover; St. Anselm's college, Manchester; Colby Junior College for Women, New London; and Union Junior College at Tilton. There were in 1939 some 198 sanatoriums licensed by the state board of health. Total state expenditures for public education, year ending June 30, 1939, \$4,764,242. Data made available by the state board of education for a total of 82,933 public and state school pupils and 32,950 private school pupils, with a total of 115,833 enrolled in all educational institutions. In 1938 there were approximately 21,000 children enrolled in elementary parochial schools.

Banking and Finance.—Savings banks and savings departments of trust companies reported deposits of \$205,579,479, as of June 30, 1940, being an increase over June 30, 1939, of \$1,115,064. There were also 27 building and loan associations with resources of \$12,543,567, an increase of \$573,113 over 1939. Cash receipts of state treasury department, for fiscal year ending June 30, 1939, \$38,502,796; cash disbursements, \$39,302,215. Net total bond and note and temporary loan debt, June 30, 1939, \$10,328,744. Action taken by the legislature in 1937 and 1939 with respect to a debt reorganization plan for financing, is resulting in an orderly procedure for funded debt retirement.

Agriculture, Manufactures, Mineral Production.—Major farm products are milk and cream, potatoes, apples, dairy cattle and live poultry, marketed principally in cities of eastern and central Massachusetts and New York city. Estimated acreage in 1934, used for crops, 448,000; for pasture, 961,000; woodland, 1,274,000. Lumber production, 1937, estimated at 157,000,000 board feet. A supply of white pine lumber rendered available as a result of the hurricane of 1938 and estimated at 500,000,000 board feet, was salvaged. Number of farms, 1935, 17,695 with average acreage of 119.6; average value per acre, \$31.64. Industries of New Hampshire are marked by their diversity and by the relatively large proportion of small-sized plants. They produce textiles, boots and shoes, paper and pulp, a variety of wood products and machinery. Value of manufactures in 1937, \$249,631,724. Electric power generated in 1938, in kilowatt hours: water power 696,000,000; steam, 37,000,000; internal combustion, 1,000,000. In 1936 it was estimated that the recreation "business" produced a direct gross income of \$9,641,503. An important report was submitted in 1939 to the Commissioner for the Promotion of the Wealth and Income of the People of New Hampshire, which found that in 1936, of the total state income, 51.5% came from manufacturing; 19.6% from service; 13.6% from trade and finance; 9.9% from transportation and communication; and 5.4% from agriculture. The New Hampshire State Planning and Development commission, with headquarters at Concord, from time to time issues valuable reports on agriculture, industry and natural resources, which may be secured through Frederick P. Clark, planning director. (W. E. Ss.)

New Hebrides: see PACIFIC ISLANDS, BRITISH; FRENCH COLONIAL EMPIRE.

New Jersey, described as the "Garden State," was one of the original states of the United States and is on the Atlantic coast; area 8,224.44 sq. mi.; population according to U.S. census of 1940, 4,160,165; capital, Trenton, 124,697. The largest city is Newark, population 429,760. It ranks 18th in population of 100,000 or more. The state's population a decade ago was 4,041,334. The ten-year increase was 2.9%. Declining urban populations were noted in the 1940 census returns. Of the six cities having a population in excess of 100,000, only two, Paterson and Trenton, showed increases. Elizabeth had the largest decrease, from 114,589 in 1930 to 109,912 in 1940.

History.—In the 1940 election New Jersey polled 2,019,406 votes out of a total registration of 2,361,080. It was the highest vote in the state's history and the returns again reflected the refusal of the electorate to cast straight party tickets. President Roosevelt received 1,016,404 votes and Willkie 944,876. Charles Edison, formerly secretary of the navy, was elected governor over State Senator Robert C. Hendrickson, his Republican opponent, by 63,875. But W. Warren Barbour, running for a full six-year term in the United States senate, was elected over the Democratic nominee, James H. R. Cromwell, by 205,438.

Further evidence of the discriminating voting habits of New

Jersey was supplied by the legislative results. While Roosevelt and Edison were sweeping the state, the Republican party rolled up a majority of 79,979 on the basis of the average assembly vote. Accordingly the Republicans retained control of the assembly by a majority of 41 to 19 and of the senate by a majority of 16 to 5. Their candidate for governor, Mr. Hendrickson, polled 100,000 more votes than any winning governor the state has had.

President Roosevelt's majority fell sharply below his 1936 total of 364,128, although he polled only 67,145 fewer votes. This decline is accounted for by the fact that Wendell L. Willkie, who had made two stumping tours of the state, received 944,876 votes whereas Alfred M. Landon in 1936 had polled only 719,876.

The election was preceded by a Republican drive against the Hudson county organization of Mayor Frank Hague of Jersey City. The legislature tried to compel the installation of voting machines in Hudson but was unsuccessful. In response to Republican complaints against Hudson's election practices, the committee on campaign expenditures of the United States senate assigned investigators to Hudson county. Fraud had been charged in the 1937 gubernatorial election and, as the inquiry started, it was disclosed that Jersey City's poll books had been burned early in 1940. Republican candidates and managers contended the destruction of the records corroborated their allegations. Jersey City authorities maintained the burning of the poll books was legal, inasmuch as the law required only that they be preserved for two years. The Republican legislature likewise reorganized the election bureaus in Hudson and Essex counties and installed new superintendents in each. Nevertheless the Hague organization carried Hudson for Roosevelt and Edison by majorities of 100,000. In the 1936 election President Roosevelt's majority in Hudson was 163,000.

Mayor Hague and his organization were objects of Republican attack throughout the year. Senator Hendrickson had won the gubernatorial nomination in the May primary from former Governor Harold G. Hoffman after describing him as a political partner of the Democratic leader in bi-partisan trades in preceding legislatures. Senator Barbour, elected to the United States senate in 1936 for the unexpired term of Governor A. Harry Moore, was unopposed for the Republican nomination. Mayor Hague countered Republican attacks by early announcing his support of Governor Edison and of Candidate Cromwell. When the campaign began to accelerate, however, both remained aloof from the Democratic leader and said that if elected they would not "take orders."

The 1940 legislature, following the example of its immediate predecessors, again remained in session from January to January to reinforce its claim of meeting longer than any legislative body in the country.

Finance.—The net value of real and personal property, subject to taxation, in 1939 was \$5,617,803,676. That was a decrease from 1938 of \$50,074,037. These ratables are made up as follows:

CHARLES EDISON, former secretary of the navy, was elected governor of New Jersey Nov. 5, 1940, on the Democratic ticket

real estate, exclusive of second-class railroad property, \$4,730,635,309; second-class railroad property, \$196,608,382; personal property, exclusive of bank stock, \$747,543,180. The average rate for 1939 was \$4.620 per \$100 of valuation. Real estate and personal property specifically exempted from taxation for 1939 amounted to \$1,076,667,563, comprising mainly schools, churches, cemeteries, public and charitable properties.

Agriculture and Manufacturing.—Gross income of New Jersey farmers for 1939 was \$105,848,000. This was an increase of \$3,632,000 over 1938. The figures include income from marketing and government payments.

For agricultural statistics see ALFALFA; APPLES; BARLEY; BUCKWHEAT; CORN; FARM MACHINERY; GRAPES; HAY; OATS; PEACHES; PEARS; POTATOES; SWEET POTATOES; WHEAT.

The diversified character of New Jersey's industries was demonstrated by the large amount of defence contracts placed by the United States government. A month before the end of 1940 these contracts ran to \$1,121,732,669. The figures for naval contracts totalled \$796,506,028 and for the army \$325,226,641.

(A. J. S.)

New Mexico, the fourth largest state in the southwestern United States, popularly known as the "Sunshine State"; area, 122,634 sq.mi.; population according to U.S. census of 1940, 531,818. Capital, Santa Fe, 20,325. Albuquerque is the only larger city, 35,449. Of the state's population 176,401 are urban, or 33.2%.

History.—The administration, legislature and congressional representation of New Mexico is Democratic. The chief officers of state elected for two years were: governor, John E. Miles (elected); lieutenant gov., Ceferino Quintana; secretary of state, Jesse M. Gonzales; auditor, E. D. Trujillo; treasurer, Rex French; attorney general, Edward P. Chase; superintendent of public instruction, Grace J. Corrigan; commissioner of public lands, H. R. Rodgers. The national representatives are Senator Carl A. Hatch, Senator Dennis Chavez and Representative Clinton P. Anderson. In the presidential election Roosevelt received 103,699 votes against Willkie's 79,615.

Education.—For the school year 1937-38 public schools cost \$9,001,045 for 129,877 children. The state also supports the University of New Mexico, College of Agriculture and Mechanical Arts, Normal university, School of Mines, Normal school, Eastern New Mexico Junior college, Spanish American Normal school and the Military institute.

Charities and Correction.—State charitable institutions are the School for the Deaf, School for the Blind, Home and Training School for Mental Defectives, Industrial school, Girls' Welfare school, Insane Asylum, Miners hospital, penitentiary and the Carrie Tingley Crippled Children's hospital.

Banking and Finance.—On June 30, 1940 there were 41 banks with total deposits of \$60,148,000. The assessed valuation of New Mexico is \$312,945,873. Total state revenue receipts for the fiscal year ending June 30, 1940 were \$23,903,614.70. A 5-cent gasoline tax yielded \$4,975,038.88; a 2% sales tax, \$3,890,846.16 and a 5.625 mills general property tax, \$2,152,284.65. An estimated \$80,000,000 was spent by tourists.

Agriculture and Mineral Production.—The leading farm products were: gr. sorghums, 3,150,000 bu.; wheat, 1,720,000 bu.; corn, 2,376,000 bu.; beans, 656,000 bags; cotton, 123,000 bales. In 1939 there were 1,276,000 head of cattle, worth \$45,085,000 and 2,433,000 sheep worth \$14,025,000.

Mineral production for 1940: copper, \$16,241,264; zinc, \$860,220; gold, \$1,378,090.

BIBLIOGRAPHY.—A. Grove Day, *Coronado's Quest*; George I. Sand, *Forgotten People*; Thomas Matthews Pearce, *The Beloved House*; J. Keleher and Elsie Ruth Chant, *The Padre of Isleta*. (F. D. R.)

New South Wales. A state of the Australian commonwealth, lying in the southeast and occupying 309,432 sq.mi.; pop. (est. March 31, 1940) 2,775,871. Chief towns (pop. est. Dec. 31, 1939): Sydney, capital (1,302,500); Newcastle (117,050). The state governor is Capt. the Rt. Hon. Lord Wakehurst, K.C.M.G.

History.—The Labour party which forms the opposition in the state legislature suffered from internecine strife during 1940. In April Mr. Lang, ex-leader of the party and former state premier, was joined by several state and federal members in the formation of a new Labour party to be known as the Australian Labour party (non-communist). In August all the officials and executives of the state A.L.P. were suspended by the federal executive. The state parliamentary Labour party at a special meeting endorsed the action of the federal executive and a number of the suspended state officials formed a third labour group, "Australian Labour Party, State of New South Wales." All three groups submitted candidates for the senate and for a number of N.S.W. seats in the house of representatives at the general election in September. A total of 21 candidates offered themselves for the three vacant senate seats and 135 candidates contested the 28 electorates for the house of representatives. Of the four members of the non-communist group who sought re-election, three were successful and one lost his seat to the official labour candidate. The party representing the deposed N.S.W. executive received little support.

A general strike of coal miners which lasted from March 8 to May 16 caused a temporary diminution of output in a number of the heavy industries. Over the whole year, however, a largely increased output from factories engaged in war production was recorded. A number of new industrial enterprises were established. The new plant at Port Kembla for the manufacture of high quality steel sheets came into production early in 1940 and was turning out 36,000 tons a year.

R.M.A.S. "Warrego" an escort ship was launched at Cockatoo Island, Sydney, in February and the keels of two further naval vessels were laid immediately after the ceremony.

The state parliament introduced bills to enable solicitors on legal service to maintain their practices and to enable soldiers over 21 to make wills. State accounts resulted in a deficit of £200,000 compared with an estimated deficit of £1,500,000.

Dr. Michael Kelly, the Roman Catholic archbishop of Sydney and the world's oldest prelate, died on March 8 at the age of 90.

Education.—In 1939: public schools 3,285; teachers 13,047; scholars on roll 363,134; average attendance 294,628; expenditure by state £A4,960,000.

Finance.—In 1938–39: revenue £A51,710,000; expenditure £A4,163,000; debt outstanding (June 30, 1939) £A359,878,000.

Communication.—Roads (March 30, 1937) 46,108 mi. fit for motor traffic. Railways, government (June 1939) 6,141 mi. private (June 1939) 189 mi. Motor vehicles licensed (June 1940): cars 209,510; commercial vehicles 83,928; cycles 1,352; buses 823; taxicabs 1,355. Wireless receiving set licences (June 1940) 458,155. Telephones (June 1939): exchanges 2,004; instruments connected 257,246.

Agriculture and Mineral Production.—Production in 1939–40: wheat 76,551,000 bu.; butter 112,020,000 lb.; wool greasy 1,000,000 lb.; maize 2,900,000 bu.; coal (1939) 11,196,000 tons; gold (1939) 87,189 fine oz. Industry and labour: average number of employees in factories (1939–40) 233,000; employment (April 1940) 94.0%.

(W. D. MA.)

Newspapers. Three extraordinary news tasks tested the enterprise of newspapers in the United States in 1940. They were: the rapidly expanding European war; the

presidential campaign and election; and the draft lottery of the first U.S. peacetime selective service act. In greater detail, these activities may be recorded thus:

Although costing millions of dollars and taxing the co-operative efforts of U.S. newspapers and their press associations, the European war story was laid before the public, even of the smallest hamlets, with increasing detail and accuracy, during the late months of 1939 and the early part of 1940. Suddenly, on May 10, when Hitler began his invasion of Holland, Belgium and France, the news situation changed; his armies swept out before them much of the U.S. news machine. What remained was forced to operate under the censorship, controlled communications and other restrictions set up by the propaganda agency of a conquering dictator. During the last half of 1940 most of the news of continental Europe cleared through Berlin, Rome and half-free Vichy, France. Only in Britain and in various free lands on the fringes of conquest could the U.S. news man operate freely; most of his former news centres were deserted. But by gathering information where he could, by balancing official communiqué against communiqué, by carefully recording the effect of censorship and propaganda on his dispatches, the U.S. correspondent continued to keep his public informed in a way that no other nation, not even the British, was informed. Only rough estimates of the cost of the coverage were available, but both the Associated Press and the United Press reported their European costs close to \$1,000,000 over normal and much greater than at any period in the war of 1914–18. A daily cable file of 25,000 words and a daily cost of \$5,000 for cable and wireless were not unusual.

The extended and whirlwind presidential campaign of Wendell L. Willkie, Republican candidate, including not only many prepared speeches but an almost hourly bombardment of extemporaneous talks, was recorded by the political reporters as one of the most difficult campaigns U.S. newspapers had ever reported. Near the end of the campaign, when both candidates spoke almost daily, they threatened to swamp news wires and newspaper space. But, however much their editorial pages were criticized for supporting the losing candidate, the news men reported both sides with such thoroughness that few front pages failed to record every important utterance of both candidates. At the end, on Nov. 5, newspapers threw their entire personnel and facilities into tabulating the 50,000,000 ballots with such speed that President Roosevelt's victory was announced by 10 P.M.—meanwhile, they co-operated fully with the radio in spreading the news before the public.

Because of the controversy over the proportion of the daily press that opposed President Roosevelt, the *Editor & Publisher* tabulated the first authentic survey, based on individual questionnaires, of the editorial-page preferences of daily newspapers in the campaigns of 1940, 1936 and 1932. Late in Oct. 1940, returns from 1,273 daily newspapers showed 289, or 22%, editorially favouring President Roosevelt; 813, or 63%, favouring Willkie; and 171, or 13%, expressing no preference. An effort to evaluate the support on the basis of total circulation slightly reduced Willkie's percentage and increased Roosevelt's. The same returns reported 1936 editorial-page leanings as follows: 459 newspapers, or 36%, supporting Roosevelt; 727, or 57%, supporting Landon; and 87, or 6%, neutral. For the 1932 campaign, the same newspapers reported: 511, or 40%, supported Roosevelt; 656, or 52%, supported Hoover; and 94, or 7%, were neutral. As the number of newspapers reporting represented only about two-thirds of the daily press, the survey noted that most of those failing to report were smaller dailies or southern dailies.

The selective service draft brought an unexpectedly costly news task. In even the smallest community newspaper, there was first

"HELL'S CORNER" on the cliffs of Dover, England in 1940. Here reporters and photographers kept a constant watch for German aircraft approaching from France and for a possible German invasion

the duty of assisting local draft boards in assembling, arranging, and publishing the lists of local draft numbers—a task that in many cases occupied the entire personnel of the newspaper and resulted in large costs. When the lottery affecting 17,000,000 men was held in Washington on Oct. 29, the press association wires devoted 17½ hours to carrying the 9,000 lottery numbers to their newspaper clients. Then the news rooms again re-sorted the names, correlated them with local lists, and published many pages of names and numbers. Their reward was a temporary circulation gain ranging as high as 25%.

The annual listing of the ten biggest stories of the year by the three press associations evidenced the completeness with which war eclipsed all other news in the amount of newspaper space. The United Press listed the biggest stories as: (1) President Roosevelt's re-election for a third term and preliminary developments including the sensational rise of Wendell Willkie; (2) Battle of Britain which represents history's first big-scale air war; (3) Fall of France with resulting British evacuation of Dunkirk and battle of Oran; (4) United States selective service and other measures of national defence including the destroyers-for-naval-bases deal; (5) German occupancy of Norway, Denmark and the Low Countries; (6) Berlin-Rome-Tokyo axis and Japanese thrust into Indo-China; (7) Italy's attempt to invade Greece; (8) Germany's diplomatic offensive into the Balkans with abdication of Rumanian King Carol; (9) Italy's entrance into the war; (10) The enigma of Russia. The lists of the Associated Press and the International News service were practically identical, although one added Pan-American negotiations.

Partly because of the war, the annual survey showed morning newspaper circulations up 4.99% and evening circulations up 4.56% over 1939, reaching a grand total of 46,579,892 newspapers sold daily. Sunday circulations went up 3.16%, reaching a total of 22,876,878. Because of the small number of mergings and suspensions, *Ayer's Directory* reported virtually no net change in the number of dailies, the total remaining 2,015.

The most interesting new newspapers launched were the *New York PM*, illustrated daily news-magazine, which appeared on June 18 and continued through the year, although refinanced in November, and the similar *Hartford* (Conn.) *Newdaily*, which began on March 4 and lasted 89 issues. The most striking newspaper death was that of the Paris edition of the *New York Herald Tribune* in June, after 54 years of publication.

The first newsprint from southern pine was marketed by the

Southland Paper Mills of Lufkin, Tex., on Jan. 17. The first National Newspaper Week was celebrated in 5,000 cities and towns Oct. 1-7. Two newspapers faced sensational contempt of court charges which were still before supreme courts at the end of the year—the *St. Louis Post-Dispatch* and the *Los Angeles Times*, both charged with criticizing pending litigation. The longest Newspaper Guild strike, against the *Chicago Herald-American*, ended in April after 17 months. The Guild met at Memphis, fell into argument over communistic influence, and elected two new presidents—first Kenneth G. Crawford, Washington, D.C., in January, then Donal M. Sullivan, Boston, in July—succeeding to late Heywood Broun. Most publishers' meetings were concerned with the Federal Wage-Hour law, and newspapers obtained on Oct. 24 a ruling which defined newsroom "professionals" exempt from overtime. New data on reading habits were learned through the Continuing Study of Newspaper Reading which at the end of the year had analyzed 24 newspapers for the Advertising Research foundation.

Notable deaths in the newspaper world were: Frederick E. Murphy, publisher of the *Minneapolis Tribune*; Dr. John H. F. Ley, editor emeritus of the *New York Times*; Frederick C. Fairbanks, publisher of the *Indianapolis News*; Robert Findlay Paige, Scripps-Howard editor; Webb Miller, European news manager of the United Press, killed in England and Ralph W. Barnes, *New York Herald Tribune* correspondent, killed in a British bomber crash in Yugoslavia. (G. M. Hy.)

Great Britain.—The price of newsprint stood at £11.5s. at the outbreak of war, and before the close of 1940 had risen by over 150% to £28.10s. (plus extras); cost of other materials, of transport and of labour had also mounted—though not so steeply and though the effects were partly offset by rationing, newspaper proprietors were obliged to take other steps, such as the narrowing of columns to allow of more matter to the page, rises in advertising rates, discontinuance of canvassing and free insurance etc. About 40 provincial papers raised their selling price from 1d. to 1½d., a dozen or more suspended or ceased publication, and there were amalgamations in Great Yarmouth, Clacton, Sheerness, Barnsley and a few other small towns.

Compulsory rationing of paper culminated in July in an order fixing the maximum number of pages, 2d. dailies (the *Times* the sole survivor) being limited to 60pp. weekly, large 1d. dailies to 36pp., and "tabloids" to 72pp. The effect of all this on the public was slight, for in September it was reported that sales were down by only 5%.

Other difficulties with which the industry had to contend

ded the control—severe, arbitrary, spasmodic and uneven—reised by the ministry of information, the censorship and the vice authorities; and, in the second half of the year, the zkrieg. In London the buildings and plant of both the *Times* and the *Daily Sketch* suffered severely from German bombs, and efficient distribution system became on occasion seriously organized; but it was the proud and legitimate boast of Fleet et that no issue of any daily or Sunday paper was frustrated l that delay in delivery was negligible—a matter of a few urs at even the farthest point.

Among notable events during 1940 were the celebration in ndon (March) of the 30th anniversary of the Empire Press on, and of the jubilee (Feb.–Mar.) of the reception by the stitute of Journalists of their royal charter; also the trans- ence of part of the printing of the *Sunday Times* and *Sunday aphic* to Manchester (Sept.), and, in the same city, the in- guration of a northern edition of the *Daily Telegraph*. *France*, paper for free Frenchmen and the first French daily to be ublished in England, made its appearance. Journalism had to urn the loss, among others, of Herbert Sidebotham (March), “Scrutator” of the *Sunday Times*, a former *Manchester ardian* and *Times* man; in July of Robert Dell, for many rs correspondent in Paris and Geneva for the *Manchester ardian* and one of the best known English journalists on the ntinent; of James Douglas (Sept. 26), one-time editor first the *Star* and later of the *Daily Express*; and of Robert Keir ov. 3), for many years London editor of the *Liverpool Daily st*. (See also ADVERTISING; PRINTING.) (L. H. D.)

Newton, Alfred Edward (1863–1940), U.S. manufact- urer and author, was born in Philadelphia on Aug. 26. He was a clerk in a book store at the of 15 and was employed in various occupations until he ame engaged in the manufacture of electrical equipment in 10. In the course of time he developed an interest in first edi- s of notable books and became one of the best known collec- s in the United States with a library of 10,000 volumes, in- ding a first folio edition of Shakespeare and firsts of Dickens l many others. In 1918 he wrote an article for *The Atlantic nthly* which he later expanded into a book, *The Amenities of ok-Collecting and Kindred Affections*. The first edition is a ctor’s item. He wrote several other books, including a play the life of Samuel Johnson. He was elected president of the nson society in England, the first American to hold the office. died in Philadelphia, Sept. 29.

New York, one of the 13 original states of the Union, popu- larly known as the “Empire state,” covers an a of 49,204 sq.mi., of which 1,550 sq.mi. are water. In 1940 the population, according to the preliminary figures of the census, s 13,479,142. The foreign born, according to the census of 0, numbered 3,191,549; Negroes, 412,814; and other non- tes, 24,959. The capital is Albany, with a population in 1940 130,577. Other principal cities are New York, with a popula- n of 7,454,995; Buffalo, 575,901; Rochester, 324,975; Syra- e, 205,967; Yonkers, 142,598; Utica, 100,518; Binghamton, 309; Troy, 70,304. Of these cities, Albany, Binghamton, falo, New York, and Yonkers (which is a suburb of New rk) gained in population since 1930, and Rochester, Syracuse, y and Utica lost. Among the great cities of the world, New rk ranks next to London.

History.—At the election on Nov. 5, 1940, Roosevelt (3,251,), with the aid of 417,418 votes of the American Labor party, n the state electoral vote. The straight Republican vote for ndell Willkie (3,027,478), however, was 192,978 greater than

the straight Democratic vote for Mr. Roosevelt. James M. Mead, Democrat, was re-elected to the United States senate. Three vacancies on the bench of the court of appeals were filled by the election of Edmund J. Lewis and Albert Conway, who had the endorsement of the Republican, Democratic and American Labor parties, and C. S. Desmond, supported by the Democrats against a Republican opponent. The Republicans retained control of both houses of the legislature, making a gain of three seats in the senate and a net gain of two seats in the assembly, giving them 30 of the 51 senators and 87 of the 150 assemblymen.

The legislature, acting under the authority of a constitutional amendment ratified by the people in 1939, passed an act author- izing pari-mutuel betting at race tracks. It provided that the minimum admission fee to a race track should be \$1.50 and that the state and the track owners should share equally in 10% of the amount bet on the races. The first race under the new law was at the Jamaica track on April 15 when the total amount bet on the different races was \$821,946. Amendments modifying the judiciary article of the constitution and permitting the collection of tolls on the Erie canal were rejected. A budget of \$391,600,000 and a supplementary budget of \$1,791,000 were approved. The legislature rejected a bill providing for the erection of a state-owned electric power plant to be used as a “yardstick” for fixing rates to be charged by privately owned corporations. It also re- jected two bills intended to give New York city control over the salaries of county employees and court attachés, as well as a bill to permit the retirement of mentally incapacitated school teach- ers. The increase within 15 years by 3,000 in the number of patients in the state hospitals for the mentally ill, with the con- sequent increase in the cost of maintenance, attracted the atten- tion of the governor, and he appointed a committee of 11 to study means of reducing the number of patients and improving methods of treatment, a greater use of the parole system and the advis- ability of outside care with payment of board to those caring for the unfortunates. The governor also, acting under authority of a law passed in 1917, ordered the attorney general to make an ex- haustive inquiry into all subversive activities within the state and directed all other public officials and their subordinates to co- operate in the investigation. Scandals arising from the award of state printing contracts led the governor to appoint a commis- sion to make an investigation. The Public Service commission began to carry out a program for 68 railroad grade crossing projects, including the elimination of 148 separate crossings.

The principal officers of the state in 1940 were: governor, Herbert H. Lehman, Democrat; lieutenant governor, Charles Poletti; attorney general, John J. Bennett; commissioner of edu- cation, Ernest E. Cole; secretary of state, Michael F. Walsh; commissioner of corrections, Edward S. Mulrooney; superintend- ent of banking, William P. White.

Education.—According to the statistics for 1940 there were in the state 10,300 public schools with a total registration of 2,244, - 134 pupils, instructed by 82,349 teachers. There were 980 high schools with a registration of 738,542 pupils, taught by 25,999 teachers. The cost of supporting the schools was \$347,775,704.30 of which \$123,885,607.76 was paid by the state. In addition to the public schools there were 86 colleges and universities in the state. The Board of Regents of the University of the State of New York has general supervision over the public schools. Frank P. Graves, chancellor of the university and commissioner of education, retired in June. He had reached the age limit after serving 19 years. The regents elected Deputy Commis- sioner Ernest E. Cole as his successor.

Correction.—On June 30, 1940 there were 14 institutions under the direction of the department of correction with a total population of 18,196. On that date there were 2,797 inmates in

Sing Sing prison; 2,266 in Attica prison; 2,147 in Clinton prison; 1,702 in Auburn prison and 1,501 in Great Meadow prison. The cost of maintaining the 14 correctional institutions for the fiscal year ending June 30 was \$9,582,705.35, or \$526.54 per capita.

Banking.—There were in the state on June 30, 1940, 1,223 financial institutions incorporated under the banking laws or under the supervision of the banking department. Included in this number were 128 state banks, 162 trust companies, 15 industrial banks, 8 private banks and 134 mutual savings banks. The total deposits in all these institutions on that date were \$17,922,632,672, credited to 11,078,816 depositors. The total capital was \$670,759,510 and the total resources were \$21,385,047,880. Included in the institutions reporting to the banking department were 201 savings and loan associations with resources of \$263,549,899 on Jan. 1, 1940, of which \$243,510,499 was due to shareholders. In 1939, in addition to the banks under state control, there were 427 national banks with a capital of \$281,936,000, deposits of \$6,226,339,000 and assets of \$7,120,224,000.

Wealth and Income.—The assessed valuation of taxable real estate in the state according to the latest figures was \$25,687,333,739, which under the system of assessments represents a value of \$30,023,075,771. The total income of the people of the state is estimated at \$10,440,000,000. According to the latest federal farm census there were then 177,025 farms with a total acreage of 18,185,741. The land and buildings were valued at \$1,045,391,981 and the livestock was worth \$222,250,942. The farm population was 784,483, which included 21,113 tenant farmers and 124,206 who owned their land. In 1939, 16,113 stock companies were chartered, or 438 more than in the previous year. Of them 4,608 were to engage in real estate transactions; 7,430 had a total capitalization of \$179,512,376, while the others issued stock with no par value, and 14,239 of the corporations had their headquarters in New York city. The state had a gross bonded debt of \$671,731,000. Included in it were \$233,500,000 sinking fund bonds and \$438,231,000 serial bonds. The sinking fund contained \$145,947,430, which reduced the gross debt to a net debt of \$525,783,570. (G. W. Do.)

New York City.

The city council, elected for the second time under the proportional representation system, met in January with 14 Democratic members, two American Labor party, two Fusionists, one Republican and one Independent. At the November election a proposal to abandon the proportional representation system was rejected by the voters. President Roosevelt and United States Senator Mead, both Democrats, carried the city, and Democratic candidates for several local offices were elected. The efforts of the Bar association and the Citizens union to bring about the election of qualified judges were successful, for 18 of the 20 victorious judicial candidates had been endorsed in advance by these organizations.

Although the population of the city has increased, the enrolment in the public schools has been decreasing since 1936. In that year the enrolment was 1,121,084, and in 1940 it was 1,093,683. Yet during 1940 ten new school houses were completed at a cost of \$13,887,363, of which \$602,373 was contributed by the Work Projects administration. The board of education, acting under authority of a law passed by the legislature, voted to release pupils from the schools for one hour every Wednesday afternoon so that they might receive religious instruction from such teachers as their parents might select. The school budget for the year called for \$158,000,000 with a supplemental estimate of \$11,000,000 if the money could be found. A legislative committee inquiring into subversive activities in the schools found that some teachers and many pupils were working with the communists.

The socialization of transportation in the city began many years ago when subways were built at public expense and leased to operating companies. In 1921 the city set out on a program looking to the ownership and operation of the surface and elevated lines as well as the subways. The plan was consummated in the summer of 1940 when the city completed the purchase of the privately owned subway and elevated lines and part of the surface lines in Brooklyn and rejected a proposal for the incorporation of a company to operate the whole transportation system. As a result the employees, numbering about 29,000, became employees of the city subject to civil service regulations. The cost of the system, to date, according to the Citizens Budget commission, is \$1,432,000,000.

In pursuit of the policy to get rid of the elevated railroads a subway under Sixth ave. was opened on Dec. 14, to take the place of the demolished elevated road in that street. In order to facilitate traffic movement among the different sections of the city, bridges and tunnels have been built. The latest tunnel to be completed connects midtown Manhattan with Long Island City under the East river. It was opened to the public on Nov. 15. Another tunnel, which has been talked about for many years, is to connect the Battery in Manhattan with Hamilton ave. in Brooklyn. President Roosevelt broke ground for it on Oct. 20. Its estimated cost is \$81,000,000. A borough hall for the accommodation of the officials was built in the borough of Queens.

Following the passage five years ago of a law permitting the opening of places of amusement on Sunday, the moving picture theatres, vaudeville and burlesque shows were open on that day, but because the actors demanded double pay for Sunday appearances the legitimate theatres remained closed. In November, however, the actors' association withdrew the demand for extra pay, and on the first Sunday 11 of the 19 theatres in operation opened their doors to the public.

An investigation into the charge of collusive bidding for city printing led to the presentation to the grand jury in New York county of the case against the printers. The investigators recommended that the city establish a printing plant of its own and estimated that it would result in a saving of \$250,000 a year. (See also MUNICIPAL GOVERNMENT.) (G. W. Do.)

New York University.

Supplementing traditional disciplines in the humanities, the university in 1940 extended the offering of its co-educational liberal arts college at Washington Square to include combination four-year arts and science, radio, arts-medical technology and arts-government courses. These programs, leading to the baccalaureate, provide an interweaving of cultural and technical training. Similarly, a six-year combination program for liberal arts and engineering students, who may seek the advantages of training in both fields was instituted at the University Heights centre. Several special courses keyed to national defence activities were introduced, chiefly in engineering, and the program of student aeroplane pilot training in collaboration with the Civil Aeronautics authority, was enlarged.

Gifts received by the university approximated \$500,000, with medical research the principal beneficiary. The university's total assets were valued at some \$27,500,000, and the operating budget for the year 1939-40 was \$9,141,299.98. The student enrolment totalled 45,777, and the faculty 2,192. June 1940 marked the largest commencement of the institution, with 4,967 graduates receiving degrees and certificates. (H. W. Ch.)

New York World's Fair: see ARCHITECTURE; ART GALLERIES AND ART MUSEUMS; ELECTRIC LIGHTING; FAIRS, EXHIBITIONS AND EXPOSITIONS.

New Zealand, Dominion of. A British dominion, consisting of a group of islands lying in the south Pacific between $34^{\circ} 25'$ and $47^{\circ} 17'$ S., and between $166^{\circ} 26'$ and $178^{\circ} 36'$ E. Area: Dominion proper, 103,415 sq. mi.; other islands, 519 sq. mi.; pop.: Dominion proper (est. March 31, 1940), 1,640,901 (Maoris 90,980); Cook and other Pacific islands (census 1936), 16,350. Chief towns (pop. est. April 1, 1939): Auckland (221,500); Wellington (cap. 157,900); Christchurch (135,400); Dunedin (82,800). Ruler: King George VI.; governor general (elect): Air Marshal Sir Cyril Newall, M.C.; language: English; religion: Christian (1936 figures, excluding Maoris: Church of England 600,786; Presbyterian 367,786; Roman Catholic 195,261; Methodist 121,012).

History.—Events in New Zealand during 1940 were largely controlled by the progress of the war. During the European winter of 1939–40, when little hint was given of the great events to come, some interest was maintained in local politics, while celebrations of the dominion's centenary were nationwide. The revelation of the appointment of J. A. Lee as parliamentary undersecretary to the minister of finance brought into the open an internal division in the Labour party which had caused the prime minister, M. J. Savage, much worry for some time. Mr. Lee's action in writing a magazine article criticizing his leader, who was ill, led to his expulsion from the Labour party. Later, W. E. Arnold, speaker of the house of representatives, resigned from the party but retained his seat in parliament. Both men held that the government had failed to implement the full labour program, especially in their attitude to the trading banks and the use of reserve bank credit. Their left-wing movement had some support in the country, but not enough seriously to endanger the government's position. The inclusion of a member of the left wing, Dr. D. G. McMillan, in the cabinet helped to placate that section of the movement.

The death of Mr. Savage on March 26, 1940 was the occasion for a great demonstration of public grief. Peter Fraser, the new prime minister, had achieved outstanding success as minister of education. His capacity for leadership was soon tested when the invasion of the low countries and the rapid progress of Hitler's armies brought the country face to face with extremely grim realities. The Labour party disliked compulsory military service, but when the new British government, under Winston Churchill, announced its determination to carry on even without France, the Labour government, after calling a party conference, declared for conscription both of men and wealth.

The voluntary system of enlistment had produced a steady

flow of men to the colours, but its unfairness was the subject of increasing public protest. The National Service emergency regulations provided for a general reserve of three classes, single men, married men and women. If necessary, single men between 21 and 41 might be selected by ballot for service overseas. By July 22, when voluntary enlistment for the army ceased, some 80,000 men had volunteered for service overseas, 63,747 for the army, more than 14,000 for the air force, and the balance for the navy. The arrival of the first and third echelons of the second New Zealand expeditionary force in Egypt in February and October respectively and of the second echelon in Britain in June aroused world-wide interest. In the royal air force, exploits of New Zealanders who numbered about 1,400 by the end of the year, were recognized by many awards of the distinguished flying cross.

In July protracted negotiations between the government and the opposition led to the formation of the following war cabinet: P. Fraser (prime minister), W. Nash (minister of finance), and F. Jones (minister of defence), of the Labour party, and A. Hamilton, leader of the opposition, and J. G. Coates, a former prime minister, of the National party. The labour cabinet was continuing to function for the administration of affairs not directly concerned with the country's war effort. Any action necessary to secure co-ordination between the two cabinets was to be taken by the prime minister.

Though a small nation in the military sense, New Zealand has primary industries of vast importance to the empire's war effort in view of the absorption of Denmark, Holland and other sources of Britain's food supplies in the Nazi machine. A production plan drawn up for the farming industry involved considerable increases in production of cheese, bacon and beef, without reducing the quantity of butter and lamb sent to Britain. The minister of supply was given ample powers to control all production in the interests of the war effort. The minister of finance was given the power to raise compulsory loans.

The adhesion of Japan to the axis created additional problems for New Zealand, but the country can reasonably expect to repel any attempt at invasion. The economic pressure which can be applied to Japan must be a formidable factor in assuring the safety of New Zealand.

Education.—(July 1939) Elementary: state schools 2,213; scholars 203,739; intermediate schools 17; scholars 4,542; post-intermediate 197; scholars 41,577. University of New Zealand has six constituent colleges, including the two agricultural colleges at Lincoln and Palmerston North, grouped together as the New Zealand School of Agriculture.

Defence Forces.—(Expenditure from war expenses account):

ARMED TROOPS of New Zealand at their camp near Cairo, Egypt in 1940

actual 1939-40, navy £902,702; army £3,572,532; air £2,596,145; estimated 1940-41, navy £1,500,000; army, £30,000,000; air £6,000,000.

Banking and Finance.—Revenue, consolidated fund (1939-40) £37,974,159, war expenses account (1939-40) £2,181,835, (est. 1940-41) £14,120,000; expenditure, consolidated fund (1939-40) £37,654,820; budget estimate (1940-41) £37,034,000; public debt (March 31, 1940) £322,907,536; note circulation, active (July 29, 1940) £19,623,000; reserve (in Reserve bank, Aug. 19, 1940) gold £2,802,000; sterling £12,192,000; (in Reserve bank, Oct. 21, 1940) gold £2,802,000; sterling £8,821,000. Exchange rate: £N.Z.125=£100 sterling. Owing to the diversion of revenue and expenditure to the war expenses account, these figures are not strictly comparable to those of previous years.

Trade and Communication.—Overseas trade (merchandise): imports (1939) £49,387,183; Jan.-June 1940 £24,869,580; exports (1939) £57,407,680; (Jan.-June 1940) £44,302,738; re-exports (1939) £601,037. Communications and transport: roads suitable for motor traffic (March 31, 1940) 48,521 mi.; railways open to traffic (March 31, 1940) 3,390 mi.; shipping (1939) entered 2,974,833 tons net; cleared 3,032,981 tons net; commercial air transport (1939): aircraft engaged 20; miles flown 1,950,546; passengers carried 57,337; mail and freight carried 498,519 lb.; motor vehicles licensed (March 1940): cars, taxis, etc., 246,588; trucks 50,983; buses 754; cycles 19,201; wireless receiving set licences 338,249; telephones, number of subscribers 165,151.

Agriculture and Minerals.—Values in New Zealand currency in 1937-38: agricultural £6,900,000; pastoral £32,000,000; dairying and poultry £28,900,000. Production in 1939-40, wheat 8,010,089 bu.; butter (export 1939) 2,449,211 cwt.; cheese (export 1939) 1,671,343 cwt.; coal (1939) 2,342,639 tons; potatoes 87,671 tons; oats (1939-40) 2,081,106 bu.; barley (1939-40) 915,805 bu.; cattle (1940) 4,533,032 head; horses 271,581; pigs 714,001; gold (1939) 178,955 fine ounces. For additional statistics see HOGS; MERCURY; SUPERPHOSPHATES; WOOL.

(A. J. HP.)

Nicaragua, a Central American republic lying between Honduras and Costa Rica and reaching from the Caribbean sea on the east to the Pacific ocean on the west; language, Spanish; capital, Managua; president, Anastasio Somoza. The area is 49,000 sq.mi. Census statistics are officially admitted to be woefully inadequate. The latest census, that of 1920, showed a total population of 638,119 but was admittedly incomplete. Subsequent unofficial estimates have placed the figure at from 850,000 to 1,100,000. The chief cities, with their respective populations (estimated in 1935) are: Managua, 61,679; León, 58,957; Matagalpa, 39,271; Granada, 27,120.

The Nicaraguan economic situation substantially improved in 1940 as the government took several important steps to counteract unsatisfactory conditions brought on by the European war. These included acceleration of highway construction, strict government economy, and aid to agriculture through credits to producers and assistance in purchase of agricultural machinery. Exports of coffee, at slightly higher prices, increased, while gold exports, largely to the United States, rose to such an extent that coffee was displaced as the leading export commodity. Negotiations begun in 1939 resulted in the granting, by the United States Export and Import bank, of a \$2,000,000 credit to the Nicaraguan government. Proceeds of the loan were used to continue work on the Nicaraguan section of the Inter-American highway, to be completed in two years, and for other public works projects. A United States army commission continued study of the feasibility of a barge canal to connect Lake Nicaragua with the Caribbean by way of the San Juan river. Tentative approval of plans by the Costa

Rican government removed one of the major obstacles. The barge canal project was regarded by some observers as paving the way for an eventual Nicaraguan trans-isthmian canal. Co-operation with the United States and adherence to hemisphere solidarity were pledged by President Somoza. Purported "fifth column" activity in Nicaragua resulted in charges that several Congressmen were engaged in subversive activities, while the government prohibited publication of Nazi propaganda.

Nicaragua has good external communication by water and by air, but communications within the country are limited. There are 171 mi. of government railway and an undetermined amount of short, privately owned lines. The 900 mi. highway system is being expanded, and by Aug. 1939, 245 mi. of the Inter-American highway system had been constructed. There were 1,327 telephones, nearly half of them in Managua. In 1939, the foreign trade of Nicaragua was valued at \$14,665,863, a sharp increase of 33.3% over 1938. Value of exports was \$8,300,972, a marked rise of 41.1%, with gold (42.2%), coffee (30.0%) and bananas (7.9%) the principal items. Of the exports 77.5% went to the United States and 10.9% to Germany. Gold-mining was largely in foreign hands, however, and the net benefits to the country accruing from increased production were relatively small. The coffee industry, which had been in difficulties since 1937, was materially aided by the Inter-American Coffee Quota Agreement of Nov. 1940, under which Nicaragua was allotted an export quota to the United States of 195,000 bags. Exports in 1938 were 117,943 bags. Imports (textiles, machinery and food products) valued at \$6,364,891 (an increase of 24.3%) were largely from the United States (68.4%) and Germany (12.2%). The monetary unit was the córdoba, tied to the U.S. dollar at 20 cents. Primary education was free and compulsory. In the 1937-38 school year there were 796 primary schools, with 53,184 students, and 8 secondary schools, with 849 students.

(L. W. BE.)

Nickel. No direct information was available on nickel production in 1940, but sales were reported to have risen to a record figure, which would mean 125,000 short tons or more. Canadian production, which usually accounts for about 90% of the total, made a new record high in 1939 at 113,053 short tons and this figure was presumably exceeded in 1940. The increase in consumption was largely in the United States, where total imports for the first ten months of the year exceeded by 14% those for the whole of 1939, which had in turn exceeded any previous year by 21%. On the basis of the scanty data available, one might venture to estimate the 1940 consumption at 143,000 short tons and Canadian output at 129,000 tons. War demand intensified the efforts to develop sources of supply in minor producing areas by those countries lacking access to Canadian supplies, especially the axis powers.

The German position was helped by the seizure of Norway, but not to the extent that might be thought, since Norway's domestic output was only about 1,000 metric tons, the remainder of the 7,000-8,000 tons ordinarily credited to that country having been recovered from matte imported from the Falconbridge mine in Canada. (In this connection it may be reported that the International Nickel Co. offered to handle the Falconbridge ores on a toll basis while the Norwegian smelting facilities of this company were inaccessible.) It is also understood that Germany sought Finnish ore through Russia, but up to the end of 1940 it was thought that no ores were produced at the Petsamo mine. Domestic ore production was being pushed actively, but the grade of the German deposits was so low that there was little relief in this quarter.

Italy's former supply came chiefly from Norway and Canada; in 1940 only the meagre domestic output of Norway was left, and

is Germany would presumably get the lion's share. As a re-
measure, all nickel coins were withdrawn from circulation,
yielding an estimated 1,600 metric tons of nickel. Domestic
sources were small.

For several years Japan attempted to establish sources of sup-
ply, especially in New Caledonia, Netherlands East Indies and
Brazil, and to develop her own scanty domestic resources so far
justifiable, but there was no information available on the
actual status of affairs beyond the fact that considerable amounts
ore were imported from New Caledonia. (G. A. Ro.)

Nicotinic Acid: see BIOCHEMISTRY; CHEMOTHERAPY; DIE-
TETICS; MEDICINE; PELLAGRA; VITAMINS.

Niger: see FRENCH COLONIAL EMPIRE.

Nigeria: see BRITISH WEST AFRICA.

Nitrates. There are small deposits of nitrate-bearing earth or
shale in China, Egypt, and Spain, which are locally
used to a small extent for fertilizer, and an output of 6,000-8,000
tons of potassium nitrate in India, but the only natural nitrates
exploited on an extensive scale are the caliche beds of northern
Chile, which carry 10-25% of sodium nitrate, and which supplied
the bulk of the world's nitrate requirements for a century. The
maximum output attained was 3,238,000 metric tons in 1929,
declining to 439,000 tons in 1933, with a recovery to 1,427,000
tons in the fiscal year 1938-39. Steady progress in the develop-
ment of the synthetic processes was made during the war of
1914-18, and the natural nitrates industry dropped to a point
where in 1928-29, according to the figures of the British Sulphate
Ammonia federation, it furnished only 22% of the world
supply, although this was the record year of Chilean output. The
depression then took a heavy toll of the Chilean industry, while
manufactured nitrogen suffered little, and in 1932-33 Chilean
nitrate supplied only 7% of the world total nitrogen supply.
Although the Chilean output has shown a heavy increase since
1932, synthetic production has expanded so rapidly that in 1938-
39 the Chilean share of the world total supply had increased only
to 8%. The synthetic plant capacity now available is far in excess
of the total world demand for combined nitrogen. (G. A. Ro.)

Rixson, Lewis (1861-1940), U.S. shipbuilder, was born in
Leesburg, Va., April 7. He was graduated from
the United States Naval academy in 1882 and was sent by the
navy department to continue his studies at the Royal Naval col-
lege in Greenwich, England. In 1884 he was transferred to the
construction corps of the navy, where he designed the battleships
"Oregon," "Indiana" and "Massachusetts." He resigned from the
navy in 1895 and began to build ships on his own account at
Elizabeth, N.J., where he built 100 vessels in six years. He inter-
ested himself in politics in New York city and was appointed
president of the East River Bridge commission in 1898 by Mayor
John W. Wyck. When Richard Croker retired as leader of Tammany
Hall he succeeded to that post, but held it for only six months.
In 1919 he was appointed superintendent of public works by the
governor of New York and later he served on the public service
commission. He died in Long Branch, N.J., Sept. 23.

Nobel Prizes. The customary annual awards of Nobel prizes
did not take place in 1940. Shortly after
Germany invaded Norway the nazis blocked the bank account of
the Norwegian Nobel prize committee, and reports from Oslo in
October indicated the possibility that the funds might be seized
permanently. A dispatch from Oslo via Berlin on Dec. 16, stated
simply that the peace prize "will not be awarded this year." The
granting of this prize to Carl von Ossietzky in 1936 became a

sort of *cause célèbre* in Germany, and no German thereafter was
allowed to accept a Nobel prize. There was no peace prize in
1939; in 1938 it went to the Nansen office in Geneva.

The following received Nobel prizes in 1939: Gerhard Domagk,
Germany (medicine); Ernest O. Lawrence, U.S.A. (physics);
Adolph Butenandt, Germany, and Leopold Ruzicka, Switzerland
(chemistry); Frans Eemil Sillanpää, Finland (literature). Do-
magk and Butenandt refused their awards. The prizes in medi-
cine, physics, chemistry and literature are awarded in Stockholm.

Noble, Gladwyn Kingsley (1894-1940), U.S. herpetolo-
gist, was born in Yonkers,
N.Y., Sept. 20. He was graduated from Harvard university in
1917 and while an undergraduate headed exploring expeditions in
search of zoological specimens. He became curator of the depart-
ment of herpetology in the American Museum of Natural His-
tory, New York city, in 1919 and nine years later curator of the
museum's department of experimental biology. He died in Engle-
wood, N.J., Dec. 9.

Norris, James Flack (1871-1940), U.S. chemist, was
born in Baltimore, Md., Jan. 20,
and was graduated from Johns Hopkins university in 1892. He
taught chemistry in the Massachusetts Institute of Technology,
Simmons college and Vanderbilt university from 1895 until 1916,
when he was called back to the Massachusetts institute as pro-
fessor of organic chemistry and director of the laboratory. He
was in charge of war gas investigation for the U.S. bureau of
mines in 1917-18 and directed the U.S. chemical warfare service
in England in 1918. He was president of the American Chemical
society in 1925-26 and vice-president of the International Union
of Pure and Applied Chemistry 1925-28. He was the author of
several books on chemistry. He died in Boston, Aug. 3.

North Borneo: see BORNEO.

North Carolina, popularly known as the "Old North state"
or the "Tar Heel state," is one of the At-
lantic coast states of the United States; area 52,286 sq.mi.;

JOSEPH M. BROUGHTON, Democrat, was
elected governor of North Carolina in 1940

population according to
the U.S. census of 1940,
3,571,623. Capital, Ra-
leigh, 46,897; Charlotte,
the largest city, 100,899.
Of the state's population
in 1940, 974,175 (27.3%)
were urban. In 1930,
Negroes numbered 29%,
and foreign-born, 8,788.

History.—The year
was characterized by ac-
tivity in politics and na-
tional defence. In the
cleanest and mildest
Democratic primary in a
decade, J. M. Broughton
led the unprecedented
field of 7 candidates for
the gubernatorial nomi-
nation on May 25 and
became the party nomi-
nee when runner-up Lieut.-Gov. Wilkins P. Horton declined to
demand a second primary. In Nov. 1940 he was elected over his
Republican opponent, R. H. McNeill, by the record majority of
413,342. R. L. Harris was elected lieutenant governor. Other

state officers and congressmen (all Democrats) were re-elected. Conservative Governor Hoey sought to swing the state Democratic party to Cordell Hull for president, but the state convention in May endorsed for a third term Franklin D. Roosevelt who carried the state in November over Republican Wendell Willkie by the unprecedented majority of 395,382 in a total vote of 822,648.

In the interest of national defence, the national guard was encamped and the first peacetime conscription was launched. The vast national defence program stimulated industrial employment and prosperity in the state, through lucrative government contracts for supplies, the great expansion of Ft. Bragg and the establishment of a coast guard air base at Elizabeth City and of Ft. Davis, an anti-aircraft firing centre at Holly Ridge. But agriculture faced a war-shrunken market. In July the North Carolina tobacco farmers joined with those of the other tobacco states in voting for federal crop control for three years; and in December federal control of the cotton crop for 1941 was adopted by the cotton farmers of North Carolina and other cotton states.

On Nov. 1, the Pennsylvania Central air lines inaugurated an east-west passenger and express service between Norfolk, Va. and Knoxville, Tenn., via the North Carolina towns of Rocky Mount, Raleigh and Greensboro.

Winter cold, snow and sleet and August floods wrought millions of dollars of damage to the highway system, which was repaired in part by allocations by the governor from the highway fund surplus.

By popular vote Johnston became the first county to close within its borders the state system of liquor stores.

Important state officers (1940): Clyde R. Hoey, governor; Wilkins P. Horton, lieutenant governor; Thad Eure, secretary of state; George Ross Pou, auditor; C. M. Johnson, treasurer; Clyde A. Erwin, superintendent of public instruction; Harry McMullan, attorney-general; W. P. Stacy, chief justice.

Education.—North Carolina maintains separate public schools for whites, Negroes and Indians, with minimum eight months' term and compulsory attendance from 7 to 13 years of age, inclusive. In 1938-39, there were 3,973 public elementary and 962 high schools, with 25,448 teachers and 892,543 enrolment, operated at a cost of \$30,459,626, about four-fifths of which was contributed by the state government. The state appropriation for 1940-41 is \$27,000,000. The state maintained three branches of the consolidated University of North Carolina at Chapel Hill, Raleigh and Greensboro, with an enrolment of 15,821 in 1938-39, as well as 12 standard and teachers' colleges (six for whites, five for Negroes, one for Indians). There were 41 private colleges for whites and Negroes. There were 9,804 prisoners in the state prison and various road camps on July 1, 1940; and in December, 37,157 aged persons and 23,564 dependent children received public grants, averaging \$10.12 and \$6.91 per capita, respectively.

Banking and Finance.—In 1939-40, state expenditures were \$144,835,270; receipts \$144,042,822. The assessed value of real and personal property was \$2,337,223,566 in 1939. The state bonded debt was \$147,733,500 on June 30, 1940. There were 43 national banks with deposits of \$111,159,000 and 185 state commercial and industrial banks and trust companies, with \$370,672,220 on June 30, 1940. In 1940 there were 4,596 mi. of railroads, 494 mi. of city bus routes, 6,756 mi. of passenger vehicle routes and 6,753 mi. of freight vehicle routes; and the state highway and public works commission maintained 11,309 mi. of state highways and 47,385 mi. of county roads, of which 10,946 mi. were hard surfaced. Federal internal revenue collections of \$326,920,750 in North Carolina in 1937-38 were exceeded only by those in New York, Illinois and Pennsylvania.

Agriculture, Manufactures and Mining.—In 1937, 2,896

manufacturing establishments employed 258,771 wage earners wages of \$189,266,474 and made products valued at \$1,384,736,686. The leading industries were tobacco, cotton goods, knit goods and furniture. The mineral production in 1939 was valued at \$14,959,228, chiefly granite, sand and gravel, feldspar, mica and ceramics; the kilowatt-hour production of electricity in 1939 was 2,488,617,000. The total acreage of United States lands in national forests in the state was 929,612 in 1940. The value of the lands and buildings on the 300,967 farms in North Carolina in 1935, approximately half of which were operated by tenants, was \$622,834,983. The North Carolina Farm survey, 1939, reported 288,440 farms in the state. In 1940, the total value of the major crops decreased 8% below that in 1939 to \$213,353,000, of which tobacco and cotton accounted for \$129,044,000. Due mainly to the federal control program, tobacco decreased 38% in production, to 506,820,000 lb. but only 30% in value, to \$86,524,000.

Cotton production increased from 457,000 bales in 1939 to 740,000 in 1940 with a value (including seed) of \$42,520,000.

BIBLIOGRAPHY.—*Blue Book of Southern Progress* (1940); current newspapers; reports of state offices. (A. R. N.)

North Dakota, north-central state of the United States and popularly known as the "Flickertail state" has an area of 70,837 sq. mi. and a population of 641,935 (1940). The capital is Bismarck, population 15,496 (1940). Cities with larger population were: Fargo, 32,580; Grand Forks, 20,228; and Minot, 16,577. Of the population of the state 131,923 were urban and 510,012 rural in 1940.

History.—Principal officers of the state were: United States senators, William Langer and Gerald P. Nye; representatives in congress, Usher L. Burdick and Charles R. Robertson; governor, John Moses; lieutenant governor, Oscar W. Hagen; secretary of state, Herman Thorson; state auditor, Berta E. Baker; state treasurer, Carl Anderson; attorney-general, Alvin C. Strutz; commissioner of insurance, Oscar E. Erickson; commissioner of agriculture and labour, Math Dahl; public service commissioner, Ben C. Larkin and C. W. McDonnell; superintendent of public instruction, Arthur E. Thompson; state tax commissioner, John Gray; judges of the state supreme court: A. G. Burr, chief justice; W. L. Nuessle, A. M. Christianson, James Morris, Thomas Burke. In the presidential election of 1940 Willkie received 150,590 votes; Roosevelt, 124,036 votes.

Education.—The institutions of higher learning are the state university and school of mines, the agricultural college, three state teachers' colleges, two normal schools, the school of forestry and the school of science. The total enrolment in these institutions for the academic year of 1939-40 was about 7,500. The enrolment in the high schools for the same year was 33,914 and for the rural and elementary schools, 105,782. The total cost of operating these schools was \$9,979,906. The institutions of higher learning are under the unified control of a board of higher education composed of seven members appointed by the governor from a list furnished by an ex officio nominating committee.

Finance.—On June 30, 1940, 120 state banks and one trust company operating within the state of North Dakota, reported invested capital, including \$821,000 debentures held by the Reconstruction Finance corporation, of \$4,548,000 and total deposits of \$24,447,000. On June 30, 1940, latest date for which information was available, 47 national banks operating within the state of North Dakota reported a total invested capital of \$5,866,000 which amount included preferred stock held by the Reconstruction Finance corporation and total deposits of \$49,895,000.

Agriculture, Manufactures and Minerals.—In 1940 there were under cultivation 23,930,032 ac. and the estimated value was \$707,138,992. The estimated farm income for the year was \$190-

10,000. For 1940 the state produced 12% of the total wheat production in the U.S., 50% of all spring wheat produced and 1% of the national production of durum wheat. The state stood first in the number of bushels of wheat stored on federal loan, 1,343,015 bu. The state produced 12.5% of the national production of flax and stood second in the production of certified seed potatoes, 2,361,040 bu. Its total production of potatoes was 1,920,000 bu. for 1940. The state mined in 1939 2,131,252 tons of lignite coal, valued at \$2,425,000. (O. G. L.)

Northern Ireland: see IRELAND, NORTHERN.

Northern Rhodesia: see RHODESIA.

Northern Territory, of Australia; area 523,620 sq.mi.; pop. 14,089 (June 30, 1939): Aborigines, full-blooded, 14,089; half-caste, 913; white (est. Dec. 31, 1939), 6,973. **History.**—As an urgent defence measure, work was commenced in 1940 on the construction of a strategic road to connect the two railway termini at Alice Springs and Birdum. The military authorities were providing camps, rations, medical services and transport and the road authorities of the states of New South Wales, Queensland and South Australia were co-operating in providing the technical equipment and labour. The length of the projected road is 625 mi. and 500 workmen were engaged on this task which was estimated to cost £200,000.

The federal government commenced the construction of a wharf at Darwin as part of the scheme for the establishment of an important base. The new structure was estimated to cost £160,000 and was to be large enough to accommodate vessels of capital class and was to include modern equipment for the handling of cargo.

Finance.—Revenue (1939-40), actual, £A.99,634; from Central Australia railway (1939-40), £A.150,763; from North Australia railway (1939-40), £A.56,955. Expenditure, ordinary appropriation (1939-40), £A.382,802.

Agriculture, etc.—Production in 1938-39: pastoral industry, £A.426,021; gold, £A.115,835; pearl shell, £A.31,500. Railways, 508 mi. (W. D. MA.)

Orthrup, Edwin Fitch (1866-1940), U.S. electrothermic engineer, was born in Syracuse, N.Y., Feb. 23. He was graduated from Amherst college in 1891 and did postgraduate work at Cornell and Johns Hopkins. After a year in general engineering work he became associated with the Howland Printing Telegraph company and remained as its construction engineer until 1902. He was then associated with a company manufacturing electrical instruments in Philadelphia until 1910, when he joined the faculty of Princeton university, remaining there until 1919. He held patents on 104 devices for the production and measurement of high temperatures, including an induction furnace which produced a temperature of 3,000° in 1931. He died at Princeton, N.J., April 29.

Northwestern University was chartered in 1851 as an institution of higher learning under the control of the Methodist Episcopal Church. The university comprises the following divisions: the college of liberal arts, the graduate school and the schools of engineering, music, education, speech, commerce and journalism, all located in Evanston (suburb of Chicago) on a campus bordering Lake Michigan; the medical, law and dental schools and the evening departments of the university, all on Chicago's near north side, on a campus six blocks from the loop business district. The enrolment of the university for the first semester of 1940-41 consisted of 6,315 full-time students, of whom 4,985 were registered on the Evanston

campus; and 9,200 part-time and evening students, of whom 8,342 were registered on the Chicago campus. The 1940 summer session had an enrolment of 5,076 students.

During the calendar year of 1940, the university received gifts totalling \$2,426,573, including a gift from the Clara A. Abbott trust of \$1,662,748 for medical, chemical and surgical research. The budget for the year 1940-41 totalled \$5,967,580 and the value of all land and buildings used for educational purposes was \$17,333,997. The faculty of the university, including lecturers and demonstrators, totalled 1,471, of whom 798 were full-time members. The university's productive endowment amounted to \$24,904,797.

One of the important developments during the year was the building of the Northwestern Technological institute, made possible by a gift of \$6,735,000 from the Walter P. Murphy Foundation.

During the year the university completed construction of three new buildings: Abbott hall, a \$1,500,000, 18-story dormitory on the Chicago campus; Scott hall, a \$650,000 student social centre and auditorium on the Evanston campus; and Patten gymnasium, a new intramural gymnasium costing \$425,000.

Northwest Territories embrace all of the mainland in Canada east of Yukon territory and north of the provinces; all islands in Hudson and James bays and Hudson strait, including Ungava bay; all the Arctic islands north of the mainland within the area bounded on the east by a line passing midway between Greenland and Baffin, Devon and Ellesmere islands, to and along the 60th meridian of longitude to the north pole, and on the west by the 141st meridian of longitude to the pole. The land and water area is estimated at 1,309,682 square miles. The 1931 census shows a population of 9,723 composed of Eskimos, Indians and whites.

Government.—The Northwest Territories are governed by a territorial council composed of a commissioner, deputy commissioner and five councillors appointed by the governor general in council. The seat of government is at Ottawa.

Trade and Communication.—The welfare of the native population and the conservation of the wild life upon which the natives depend for subsistence are among the chief responsibilities of the administration. An aggregate area of 609,277 sq.mi. has been set aside as game preserves or sanctuaries. Hunting and trapping by others than natives is restricted. Trapping for, and trading in, furs is regulated by permit. The government reindeer industry in the northern Mackenzie district is progressing favourably. Access to the Northwest Territories is by ocean and river transport and by air. Communication is maintained by mail and radio-telegraphy.

Mining.—Development at the Con, Negus and Rycon mines in the Yellowknife area continued, their monthly gold production averaging some \$70,000, \$60,000 and \$7,000 respectively. The pitchblende-silver mine of Eldorado Gold Mines, Limited, at Great Bear lake, discontinued operation in June 1940, the company having sufficient concentrates on hand for the requirements of their refinery at Port Hope, Ont., for more than two years. More than 4,500 mineral claims were in good standing throughout the territories on Sept. 1, 1940. A notable development in 1939 was the erection near Norman, by Northwest company, of a refinery with a capacity of 840 bbl. per day which is producing aviation gasoline and light and heavy diesel oil. (R. A. G.)

Norway, country of northwest Europe. Bounded N. by the Arctic ocean, E. by Finland and Sweden, S. and W. by the North sea and Arctic ocean. Area 124,556 sq.mi.; population (est. Jan. 1, 1939), 2,921,000. Chief towns (population

1930): Oslo (capital, 253,124); Bergen (98,303); Trondhjem (54,458); Stavanger (46,780). Language: Norwegian; religion: Christian (Evangelical Lutheran).

History.—The conflict between Norway's great power neighbours, which broke out in 1939, threatened her security and disrupted her economy in much the same way as had the struggle of 1914–18. Now the danger was greater because the perfected instruments of mechanical warfare vastly increased the range of operations. For the first time in its history Norway was brought directly within the strategic orbit of continental warfare. First the Russo-Finnish war brought a demand for the passage of Allied troops through Norway. The government refused the demand and clung tenaciously to strict neutrality. Sympathy was with the Finns, and many Norwegians felt as did the Swedes that the blow against Finland was a blow against the entire north; but aid to the Finns was confined to small contributions of arms and funds and to care for refugees.

"Incidents" increased in number and danger. Norwegian vessels were sunk by mines and submarines, and trade routes were disturbed; but the Norwegian merchant marine, one of the largest in the world (with about 5,000,000 registered tons), kept on doing business on the sea lanes. In the spring of 1940 the belligerents strained Norwegian hospitality and neutrality in such incidents as those of the "City of Flint" (1939) and the "battle" of Jössing fjord. One basic difficulty was that Germany still obtained much iron ore through Narvik. On April 8, 1940, Britain took the bull by the horns and mined Norwegian territorial waters at several points. In heated protest the Norwegians implicitly threatened war. Hardly was the ink dry on the protest when Norway found herself attacked and invaded, April 9, at all her important ports, not by the British but by the Germans.

The utter surprise of the attack, though obviously carefully planned and long prepared, was more decisive than the treason of a few men such as Vidkun Quisling (*q.v.*) and the commandant at Narvik. Popular stories of general treason were fabricated exaggerations, impossible in a country which was democratic, strongly national and thoroughly opposed in ideology to the principles of nazism. Norway had its "Nasjonal Samling," a party on fascist lines, but it polled only 2% of the vote and even with proportional representation had never elected a member to the parliament (*storting*).

(For the story of the invasion, see **EUROPEAN WAR**.)

The possibility of a Swedish occupation of Narvik, leaving the region north of that to Norwegian control, and the region south to German control, was being discussed just at the time the British and French forces withdrew from Narvik. This evacuation forced abandonment of the entire country to the Germans.

The legal aspects of German administration seem to have been more difficult in Norway than in any other of the occupied lands. The nazis failed in repeated attempts to get Haakon VII to ab-

diccate. The Norwegian constitution contains a clause permitting the king and government to reside outside Norway for an indefinite period if approved by the *storting*. This power the *storting* voted after being chased from Oslo on April 9th. Therefore the government of the king and his ministers, who in June went to London, was unquestionably the only constitutional government according to Norwegian law. The Germans had difficulty even in establishing a temporary administration. Quisling could not get together a ministry. Hence the reich commissar, Josef Terboven, had to assume definite leadership. An administration commission was established by the Norwegians on an interim basis, headed by Ingolf Christensen. Early in September, members of the *storting* gathered only semiofficially in Oslo to oppose the attempt to re-establish Quisling, and the Christensen commission was reorganized; the king was declared unable to function (according to reports; the fact at least was obvious) but other decisions were postponed. On Sept. 25 Terboven dissolved all parties except that of Quisling, set up a "state council" in which a Quisling group predominated; removed the king and declared Norway

be neither a monarchy nor a protectorate, but "indefinitely occupied by German troops." In London the government could continue to function because it had not only saved the gold reserve, but had been able to retain control of most of the great Norwegian fleet. This government in exile established a system of radio reporting to the people at home and directed some 600 Norwegians training as aeroplane pilots in Canada. Statistics of German demands on Norway indicated that the invaders extracted 15 tons of coffee in October and another 200 tons in November-December; 20 tons of chocolate; 400,000 bottles of brännvin (snaps). The army of occupation consumed practically all of the available pork, beef and eggs. Within Norway sabotage increased against railways and food supplies destined for Germany. The catch of fish was cut in half, unemployment grew, ships could not come home and trade with western Europe and America ceased. Nevertheless the national spirit regained strength and paved for the ultimate departure of the 300,000 Germans who imprisoned their country.

Trade and Communication.—(1939): exports, 808,172,000 kroner; imports, 1,361,835,000 kroner. Some of the impact of war on Norway is shown in Tables I-IV.

Notre Dame, University of. Administrative changes dominated 1940. Alumnus-president Rev. John Francis O'Hara, C.S.C., was consecrated on Jan. 15 the titular bishop of Milasa and auxiliary bishop of the army and navy diocese of the United States, crucial post in the crisis of 1940. Succeeding him in the presidency is former vice-president Rev. J. Hugh O'Donnell, C.S.C., alumnus and able administrator.

Rev. Charles C. Miltner, C.S.C., former arts and letters dean, appointed president of the University of Portland (Ore.), was succeeded at Notre Dame by Rev. Francis J. Boland, C.S.C., head of the department of politics.

A new building for the university press, a new heat-power laboratory, an addition to chemistry hall and a 7,000,000-volt generator for atom-smashing featured 1940 construction.

Appropriate Laetare medalist of the year was Lt. Gen. Hugh A. Drum, commanding the 2nd corps area, Governor's island, N.Y.

Committees began two significant tasks during the year: the defence committee, that of co-ordinating university facilities with national needs; the centennial committee, that of preparing for the 100th anniversary of the founding of the university, Nov. 26, 1842. Enrolment was 3,252 (capacity). (J. E. Ar.)

Nova Scotia, one of the original provinces of the Dominion of Canada; area 21,428 sq.mi.; population, according to the Canadian census of 1931, 512,846, estimated Jan. 1, 1941, 554,000. Capital, Halifax, 59,275. The only other city in the province is Sydney, 23,089, which is the centre of the coal, iron and steel industries. Of the province's population, 81,192 are rural or 55%; 507,235 are Canadian born or 97%. Enrolment in the public day schools was (1941) 120,127; in private day schools 2,723. The number of people who can neither read nor write is 4.26% of the population. There are four universities in the province: Acadia, having an enrolment of 431 students; the University of King's college, with an enrolment of 99; Dalhousie, with an enrolment of 842, and St. Francis Xavier, with 298 students. King's college is affiliated with Dalhousie. In addition there are an agricultural college and a normal school.

both of which are financed by the provincial government.

The liberal government continued in office with the Hon. A. S. MacMillan, premier, provincial secretary and treasurer of the province. The lieutenant governor, who is appointed by the dominion government, is the Hon. Frederick F. Mathers. Nova Scotia is represented in the dominion house of commons by 12 members, ten of whom belong to the Liberal party, and in the dominion senate by ten members who are appointed for life.

The net value of production in 1937 was \$102,321,783, an increase of 8% over the preceding year. The net value of agricultural products for the same year was \$16,675,987, a slight increase over the preceding year. The net value of forest products in 1937 was \$10,010,920; fish and fish products, \$8,494,245; mining products, \$22,597,547; manufactured products, \$33,146,796, an increase of nearly 20% in comparison with the preceding year.

Nuts. Commercial varieties of nuts in the United States are reported by the department of agriculture as pecans grown in 12 states; walnuts grown in California and Oregon; filberts in Oregon and Washington, and almonds in California. Indicated production of California almonds was reported in October as 10,800 tons (1940 crop), compared to 19,200 tons in 1939 and a ten-year (1929-38) average of 12,700 tons. California walnut crop in 1940 was estimated at 46,000 tons as against 55,000 tons in 1939 and a ten-year average of 42,030 tons. The 1940 Oregon walnut crop was the same as in 1939 (4,400 tons), compared to a ten-year average of 2,340 tons. The 1940 filbert crop in Oregon was estimated at 2,580 tons, compared to 3,160 tons in 1939 and a ten-year average of 1,025 tons; in Washington, 600 tons in 1940, 590 in 1939, and 380 tons in 1938. The 1940 pecan crop was reported as 81,829,000 lb., compared to 63,639,000 lb. in 1939 and a ten-year average of 63,430,000 lb. Improved varieties produced 18,521,000 lb. of the 1940 pecan crop, 21,304,000 lb. in 1939 and a ten-year average of 16,499,000 lb. Wild or seedling varieties yielded 63,308,000 lb. in 1940 and 42,355,000 lb. in 1939, and 46,931,000 lb. in the ten-year average.

The United States imports about \$14,000,000 of edible nuts annually. Of these Brazil nuts constitute the largest quantity, about 20,000,000 lb. of unshelled and 9,000,000 lb. of shelled nuts yearly. The 1940 crop of Brazil nuts, delivered at Para and Manaus (preliminary estimate by exporters), was 89,600,000 lb. A part of the crop was unharvested because of closing of the German market and reduced buying by the United Kingdom. Among foreign producers the 1940 almond crop in Italy was estimated at 20,600 short tons shelled, compared to 15,000 short tons in 1939. The Majorca, Balearic islands, almond crop was reported as 8,800 short tons shelled, as against 7,900 short tons in 1939. In French Morocco the 1940 almond crop was reported slightly larger than the 4,900-ton crop of 1939. Italian filbert production in 1940 was placed at 22,000 short tons unshelled, the same as in 1939, while in Spain the 1940 crop was estimated at 33,900 short tons unshelled. The Italian walnut crop in 1940 was estimated at 240,000

Oats. The largest oats crop in the United States since 1932 was produced in 1940, estimated Dec. 1 by the department of agriculture as 1,235,628,000 bu. compared to 935,942,000 bu. in 1939. The 1932 crop was 1,250,955,000 bu. The ten-year (1929-38) average crop was 1,024,852,000 bu. The yield per acre in 1940 was 35.5 bu., the third highest on record. Per acre yield for 1939 was 28.4 bu. while for the ten-year average it was 27.4 bu. Stocks of oats on U.S. farms Oct. 1, 1940, were estimated at 1,011,060,000 bu. or 83% of 1940 production. On the same date in 1939 farm reserves totalled 763,347,000 bu. or 81.4% of the 1939 crop while the ten-year average holdings for that date were 819,178,000 bu. or 80.5%. The Canadian oats crop in 1940 was estimated at 430,413,000 bu. as against 408,432,000 bu. in

1939. The wartime efforts in the United Kingdom to increase production of feed grains and other farm products resulted in a 42% increase in the oats crop of England and Wales over that of 1939. No official figures are available, but reliable reports place the 1940 crop in England and Wales at 111,400,000 bu. In Sweden the 1940 crop was reported as 78,126,000 bu. compared to 88,525,000 bu. in 1939. (See also CEREALS.) (S. O. R.)

ceanography. Because of the international situation, little oceanographic research was published in European countries during 1940 and the field work was almost entirely limited to waters close to the United States.

cean Currents.—The further development of the bathythermograph and multiple sea sampler provided reliable tools for a new approach to several important aspects of the circulation problem in the sea. These instruments are capable of disclosing the detailed distribution of temperature and salinity in the surface layer (down to 150 m.) and can be used from a vessel steaming at 10 knots or more. At such speeds physical oceanography can at last be studied more or less from the synoptic standpoint.

The importance of lateral mixing in determining the physical characteristics of the deeper waters was further emphasized. A study of the mixing in the South Atlantic of water of antarctic origin with deep water from the North Atlantic pointed to a very high coefficient of lateral mixing. It is clear from this analysis that along the convergence, separating these primary water masses, ascending flow of the mixed water may reach considerable proportions.

lankton.—Dispersal of the pelagic larval stages of animals inhabiting coastal waters received further study, both off the California coast and in the Georges banks area off New England. These investigations pointed to purely physical cause for the great variability from year to year in the distributions to the adult populations of many of the commercial fish. In this work a new plankton sampler, which is quantitatively reliable, proved most useful.

ubmarine Geology.—The precipitation of calcium carbonate in shallow waters such as the Great Bahama bank has long been a controversial problem. Recent studies give no support to the theory that bacteria are the agency, but suggest that the main deposition is effected by purely physico-chemical processes.

A simple and inexpensive submarine camera was developed to photograph the bottom in any depth. The pictures thus far secured are remarkably clear and cover an area of about 6 sq.ft. By including a compass and a current indicator in the field of the camera the action of currents on the bottom sediments can be studied. It has been found, for example, that in depths as great as 150 fathoms the sand ripples reorient themselves to the stage of the tidal flow. (See also FISHERIES; MARINE BIOLOGY; OCEANOLOGY.)

HYDROGRAPHY.—"Lateral Mixing in the Deep Water of the South Atlantic," *Jour. of Marine Research*, vol. ii, no. 3 (1939); "The Correlation of Water Movements and Dispersal of Pelagic Littoral Animals, Espe-

cially the Sand Crab, *Emerita*," *Ibid.*, vol. ii, no. 3 (1939); "A Detailed Study of the Surface Layers of the Ocean in the Neighborhood of the Gulf Stream with the Aid of Rapid Measuring Hydrographic Instruments," *Ibid.*, vol. iii, no. 1 (1940); "Instrument for Quantitative Plankton Investigations," *Limnological Society of America, Special Publications* no. 5 (1940); "The Great Bahama Bank. II. Calcium Carbonate Precipitation," *Jour. of Marine Research*, vol. iii, no. 2 (1940). (C. O'D. I.)

Ohio, north central state of the United States, popularly known as the "Buckeye state"; area, 41,040 sq.mi.; population (1940 census), 6,907,612. Capital, Columbus, with a population of 306,087 (1940). Other cities of over 100,000 were: Cleveland, 878,336; Cincinnati, 455,610; Toledo, 282,349; Akron, 244,791; Dayton, 210,718; Youngstown, 167,720; and Canton, 108,401.

History.—While President Roosevelt won Ohio's electoral votes in the Nov. 1940 election by polling 1,773,139 ballots, to 1,586,773 for Wendell Willkie, Republicans won a majority of the state offices. Governor John W. Bricker, Republican of Columbus, was re-elected, defeating former Governor Martin L. Davey, Democrat of Kent, 1,818,335 to 1,455,284. Mayor Harold H. Burton (Rep.) of Cleveland was elected to the United States senate, receiving 1,598,560 votes to the 1,454,012 that went to former Congressman-at-large John McSweeney (Dem.) of Wooster. Others elected to principal offices were: Paul M. Herbert (Rep.), lieutenant governor; John E. Sweeney (Dem.), secretary of state; Thomas J. Herbert (Rep.), attorney-general; Don H. Ebright (Rep.) treasurer; and Joseph T. Ferguson (Dem.) auditor. George H. Bender (Rep.) and Stephen M. Young (Dem.), both of Cleveland, were elected congressmen-at-large. Elected to the Ohio supreme court were: Charles B. Zimmerman, Edward C. Turner and Gilbert Bettman.

Republicans retained control of both houses of the state legislature but only by narrow margins. Ohio Democrats gained four house seats in congress to achieve equal representation with the Republicans, each having 12.

Census figures in 1940 showed that Ohio had a population increase of 3.9% and still was the fourth largest state but would lose a seat in congress because its gain was proportionately less than that of other states.

Three important actions were taken by the Ohio legislature in June. It voted to separate the presidential and state ballots, a Republican stratagem designed to protect Republican candidates for state and county offices from being overwhelmed by straight-ticket voters in the event of a national Democratic landslide. It increased maximum old age pensions from \$30 a month to \$40 effective Jan. 1, 1941 and appropriated an additional \$1,000,000 to provide for applicants for pensions who were then on the waiting list. The third important action was the appropriation of \$1,400,000 for poor relief. This, combined with improved business conditions and an Ohio supreme court ruling of July 17 which validated the law authorizing taxing units to issue bonds against delinquent taxes for poor relief, ended all fear of a repetition of the 1939 relief crises in the state. By Nov. 23 Ohio's poor relief load was down to 76,200, the lowest in three years.

The state bureau of unemployment compensation reported the placement of 158,010 persons in private industry during the first 11 months of 1940. This was an increase of 41,511 or more than 35% over the corresponding period of 1939. Part of this increase was directly attributable to the national defence program. Construction was well under way in December of one of the nation's most important arsenals on a site near Ravenna. The navy department announced that a naval ordnance plant would be erected at Canton on a site of more than 100 acres. It will cost \$16,000,000 and will employ 2,000 skilled workers. Another December an-

nouncement of the federal government was that an \$11,000,000 TNT plant would be constructed three miles south of Sandusky. Many established factories in Ohio expanded to take care of mounting orders. One of the largest of these expansions was that of the Industrial Rayon corporation which is building a \$4,000,000 addition to its plant near Painesville to increase production 50%. Steel tonnage output in the Youngstown district broke all records as the mills in December climbed to 97% of theoretical capacity.

Steel production in the Cleveland-Lorain district went to 93% in December.

Education.—Howard Landis Bevis, former Ohio supreme court judge, was appointed the seventh president of Ohio State university Jan. 8, 1940 and took up his duties at the fifth largest university in the nation on Feb. 1.

Agriculture, Manufactures, Mineral Production.—Important crops with figures of production for 1940 are as follows: corn, 120,750,000 bu.; wheat, 42,137,000 bu.; oats, 44,880,000 bu.; barley, 1,650,000 bu.; tame hay, 4,241,000 tons; tobacco, 26,430,000 lb.; potatoes, 11,800,000 bu.; soybeans, 8,400,000 bu.; sugar beets, 361,000 tons; apples, 5,074,000 bu.; grapes, 38,000 tons. Manufactures in 1937 were valued at \$5,099,816,893 or 8.4% of the national total, with steel products, rubber tires, electrical machinery and motor vehicles leading. Total mineral output in 1938 was valued at \$103,620,000. Principal minerals were coal, coke, clay products, natural gas, stone, lime and pig iron.

(P. BY.)

Ohio State University.

Formally established as a land grant institution in 1870, the Ohio State university opened its doors on Sept. 17, 1873 to a student body of 17. In the autumn quarter of 1940 the full-time, resident enrolment reached a figure of 13,016. The annual enrolment, including summer quarter, is 18,003. Centrally located in Columbus, the capital city of Ohio, the university draws its student body from all 88 counties, as well as from other states and nations.

It has a teaching staff of 1,339.

Dr. Howard Landis Bevis took office Feb. 1, 1940 as the university's seventh president, succeeding Dr. George Washington Rightmire who had been made president emeritus. The formal inauguration Oct. 25 brought 300 official delegates from colleges, universities and learned societies. During 1940 a new men's dormitory housing 550 men was completed, and additional facilities for women were provided. The research program was expanded through gifts to the new development fund, most notable being the installation of a new cyclotron and an electron microscope.

Oklahoma,

a west south central state and the forty-sixth of the United States, has a total area of 70,057 sq. mi. The people of the state are popularly known as "Sooners," from the name applied to those who crossed the starting line sooner than the official time established by the government for the first land run into Oklahoma, April 22, 1889. The population in 1940 was 2,336,434, a decrease, largely in rural population, of 59,606 from 1930 to 1940. The largest loss was in that part of Oklahoma which lies in the area commonly called the "Dust Bowl." Due to the decrease, the additional representative given to the state in 1931 will probably be taken away in the new congressional apportionment. The two largest cities were Oklahoma City,

population 204,424, and Tulsa, population 142,157, both of which showed increases in the past decade.

History.—As 1940 ended, the chief interest in Oklahoma was national defence. Plans were being completed for a bomber squadron base for Oklahoma City and an aeroplane assembly plant for Tulsa. In September, the Oklahoma national guard part of the 45th division, was inducted into the army of the United States and was (1941) in training at Fort Sill. In October 300,000 men registered for the draft and a quota of 9,365 men was set for training in 1941. In an attempt to thwart any possible "fifth column" activities, several members of the Communist party were indicted by the Oklahoma county grand jury on charges of criminal syndicalism under a law passed during the World War of 1914-18.

By the end of 1940, two of the accused had been convicted and sentenced to ten years in the state prison at McAlester. Other cases were pending.

Politically, 1940 was comparatively quiet as far as state politics were concerned. The term of neither senator expired within the 76th congress, and no important state office was to be filled. In the presidential race, President Roosevelt easily won the state with 11 electoral votes with a vote of 474,313 compared to 348,577 for Mr. Willkie. With the exception of the 8th district, all incumbent Democrats were returned to the house of representatives by large majorities.

Perhaps the outstanding event of 1940 was the contest between the federal government and Governor Leon C. Phillips over the flood-control projects in the state. For several years the United States had been building a dam on the Grand river in northeastern Oklahoma. In March, the Grand River Dam authority ordered the flood gates to be closed, thus flooding acres of farm land and state highways. Governor Phillips did not feel that the state had been reimbursed properly for the lost highways and attempted to halt the flooding until proper settlement had been made. Nevertheless, the gates were ordered closed but before this could be done, the governor called out the national guard and placed the area under martial law. However, a federal court order was issued restraining the governor and the gates were closed before a settlement agreeable to the state was reached.

Banking and Finance.—Of the 77 counties, 69 are in the 10th (Kansas City) federal reserve district and eight in the 13th (Dallas) district. In June, there were 182 state banks with capital amounting to \$8,154,567 and total deposits amounting to \$55,834,005 and 209 national banks with capital stock of \$24,301,000 and deposits of \$402,903,000. The funded state debt stood at \$25,343,681, plus outstanding warrants equal to \$6,692,197.

Agriculture, Manufactures, Mineral Production.—The chief agricultural commodities are wheat, cotton, corn, grain sorghum and broom corn. The year 1940 was a good agricultural year with steady increases of yield in all crops except wheat. The production of cotton was 805,000 bales as compared to 526,000 in 1939. Wheat production was 56,332,000 bu. compared to 60,430,000 in 1939 and corn production was 40,356,000 compared to 27,216,000 bu. The principal mineral products are petroleum, coal, lead and zinc, gypsum and asphalt. There were about 12,530,000 bbl. of crude oil produced, 1,340,329 tons of coal, 185,200 tons of lead and zinc, 96,815 tons of gypsum and 106,539 tons of asphalt. This was an increase in all mineral products except gypsum. The chief manufactures were glass, cement, flour, broom, bricks, pottery and refinery products.

ario, one of the original provinces of the dominion of Canada; area, 412,582 sq.mi.; population according to the dominion census of 1931, 3,431,683, estimated Jan. 1, 1937, 3,752,000. Capital, Toronto, 631,207. Of the province's population 2,095,992 are urban, or 61%; 2,794,631 native born, 1%.

Much attention has been directed to the policy of the government of Ontario in supplying cheap light and power to the people of the province through the publicly owned and controlled Hydro-Electric Power commission. The commission provides electric services to 821 municipalities, comprising nearly all of the cities and towns in the province as well as many small communities and local areas. The actual distribution within a municipality is performed by the municipality itself, under the supervision of the commission. The capital of the commission and the principal utilities amounts to \$436,822,000, reserves \$200,103,000. Rates are low and the service is excellent. The net value of the total production of the province in 1937 was \$1,158,885,508, a slight decrease from the preceding year.

The net annual agricultural revenue in 1937 was \$225,368,910; of mineral products for 1937, \$151,874,462. The net value of the principal products was \$61,056,240; of manufactured products \$1,429,858.

The provincial election of 1937 resulted in the return to power of the Liberal party under the leadership of the Hon. Mitchell Hepburn. The party standing of the provincial legislature comprises 63 Liberals, 23 Conservatives and 4 Independents. The lieutenant-governor is the Hon. Albert Matthews. Ontario is represented in the dominion parliament by 24 senators, appointed for life and 82 members of the house of commons elected for terms of five years or less.

anges. The largest crop of oranges ever produced in the United States was grown in 1940. The department of agriculture estimated production Dec. 1, 1940¹, as 81,887,000 boxes compared to 75,646,000 in 1939 and 56,125,000 boxes for the ten-year (1929-38) average. The previous record crop was in 18-39 when 78,531,000 boxes were produced.

¹ Average net content per box is 70 lb. in California and Arizona; in other states 90 lb. [†] Failure reported.

Other production in 1940 included 2,679,000 boxes in Australia, about 300,000 boxes less than in 1939. In Jamaica 1940 production was 425,000 boxes compared to 475,000 in 1939. The

¹ Estimate, made on Dec. 1, 1940, does not take into account loss of fruit from the 12 and 13 freeze in California.

Union of South Africa established a subsidy April 19, 1940, of \$477,000 for aid to growers of all types of oranges, and growers of other citrus fruits, to "assure the survival of the industry." Exports of oranges from the Union of South Africa April to Sept. 1940, was 2,304 boxes compared to 4,325 in the same period in 1939. Exports of oranges from Palestine during the 1939-40 season were 6,540,000 boxes compared to 13,055,000 in the preceding season. The government also arranged for financial assistance to orange growers. (S. O. R.)

Oregon. The middle of the three Pacific coast states of the United States, popularly known as the "Beaver state," has an area of 96,699 sq.mi.; population, April 1, 1940 (census), 1,089,684; Portland, 1940 (census), 305,394; Salem, the capital, 1940 (census), 30,908. Governor: Charles A. Sprague.

History.—In the presidential election Franklin D. Roosevelt received 258,415 votes as against Wendell Willkie's 219,555. A Republican state treasurer, Leslie M. Scott, was elected, as was a Republican attorney-general, I. H. Van Winkle, in fairly close races. Three new representatives were elected to congress: two Republicans, James W. Mott and Homer D. Angell, and one Democrat, Walter M. Pierce.

The year 1940 saw Oregon making progress industrially, due to attraction of new manufacturing plants by cheap power provided by the federal Bonneville power administration and private electric plants and to increased production demanded by the rearmament program. At the year's end, the state's chief industry, lumbering, was employing the greatest number of workers in its history. Established plants were operating night and day and many new, small sawmills were getting into operation. The plywood branch of the industry expanded greatly during the year.

Shipbuilding was assured for Portland for the first time since the World War of 1914-18 when Willamette Iron & Steel company received a \$25,000,000 contract for construction of two navy mine layers. Parts for Boeing bombers were being made in the Iron Fireman plant. Expenditure of \$10,000,000 on the Tongue Point naval base near Astoria seemed assured and a \$9,000,000 to \$12,000,000 ammunition dump was expected to be built near Hermiston. Portland was selected as the site for an army air corps pursuit base and another was ordered built at Pendleton.

The state highway commission opened a new highway, the Willamette, across the Cascade mountains between western and eastern Oregon. A relocated highway over the Siskiyou mountains between Oregon and California was dedicated.

Education.—A school census showed 264,743 children of school age, of whom 205,928, including 63,057 high school pupils, were enrolled. There were 8,104 teachers and school properties were valued at \$62,719,297. The school debt stood at \$13,371,251.65.

Finances.—The state continued to reduce its bonded debt, which on Jan. 1, 1941, stood at \$35,141,285. Oregon cities reduced their debt by \$7,195,736 to \$47,479,174 in two years ending July 1, 1940. In the same time counties of the state reduced their indebtedness from \$18,148,575 to \$14,835,389.

Manufactures.—Latest figures list 2,107 manufacturing plants in the state, employing 65,982 persons and producing products of a value of \$363,143,053. Of this amount lumber products accounted for \$127,760,857; canned and dried fruits and vegetables, \$24,212,542; flour and other grain mill products, \$19,138,231; meat packing, \$17,253,182; paper, \$16,643,999. (P. H. P.)

Osteopathy. The American Osteopathic association, at its 1940 convention at St. Louis, adopted a resolution emphasizing the importance of the profession's "contributing and co-operating to the utmost of its facilities for the advancement and preservation of the health and safety of the

American people." To help bring this about a study was made to assist in appraising the profession and its institutions. A questionnaire was distributed to the approximately 10,000 osteopathic physicians in the United States, and by early December a total of 8,890 of these had been returned. From these it was possible to tabulate a great deal of detailed information (supplementing that already on file), covering race, marital status, citizenship, country of birth, professional education (including internship), licensure, hospital service, public health activities, type of practice, specialty certificates, membership in specialty organizations, activity and method of practice, military experience, etc. At the beginning of the fiscal year in June, 1940, it was reported that 431 osteopathic physicians were graduated during the calendar year, and that after making allowance for those deceased or retired, there were 299 more in practice than a year before. There were at that time 157 osteopathic hospitals, enough at the accepted level to care for the hospital needs of 675,500 persons. The democratic principle of government in the affairs of the association was emphasized by statistics published immediately after the convention showing that in the house of delegates, which is the legislative body of the association, the members of which are chosen by members of "divisional societies" in the various states, territories and provinces, there was representation at St. Louis from 41 states, the District of Columbia and Ontario, 96.5% of the total association membership being so represented. (R. G. HU.)

Ottawa, the capital of the Dominion of Canada and the seat of the supreme court, is situated on the right bank of the Ottawa river near the mouth of the Rideau, both rivers having very beautiful falls. The city itself is divided into an upper and a lower town by the Rideau canal. The parliament buildings are situated on a series of high bluffs which overlook the river, in one direction toward the Chaudière falls and in the opposite direction toward the Rideau falls. The population of the city is 126,872; of the metropolitan district (including Hull) 175,988. The gross value of manufactured products in 1940 was \$28,244,935. Its most important educational institution is the Université d'Ottawa.

Owens, Robert Bowie (1870–1940), U.S. electrical engineer, was born in Anne Arundel county, Md., Oct. 29, and was graduated from Columbia university in 1891. He was professor of electrical engineering at the University of Nebraska from 1891 to 1898 and then served in the same capacity at McGill university until 1909. He was then elected secretary of the Franklin institute in Philadelphia where, except during the World War of 1914–18, he served until 1924. He was noted for his discovery of the Alpha ray and for the invention of an electromagnetic system for guiding ships and aeroplanes. After leaving the Franklin institute he lived in retirement for five years, but in 1929 he accepted appointment as head of the Maryland Academy of Sciences. He resigned in 1931 because of ill health. He died at his birthplace near Annapolis on Nov. 1.

Oxford University. In spite of the war, academic activities continued throughout 1940. In Michaelmas term 1939 there were 2,761 men undergraduates in residence, which was 1,169 less than in the previous year, and about the normal number of 750 women. Before the end of Hilary term 572 men had gone out of residence, mainly to join the fighting services, but there were 270 further matriculations in Hilary

and Trinity terms. In Michaelmas term 1940, 731 men and women matriculated and the new academic year began with about 2,750 men and women undergraduates in residence.

Special courses were introduced in 1939 for undergraduates likely to be called up for national service before completing the normal residence, the subjects covered being those of central importance in each faculty. The candidates' choice of subjects was limited in order to preserve the specialist character of the Oxford honour schools.

In the academic year 1939–40, the number of research students was 206 which was 88 less than in the previous year; 996 persons took the B.A. degree, 312 the M.A., and the total number of persons taking all other degrees was 186. On account of the war most university scholarships and prizes were suspended, but college scholarships, with few exceptions, were awarded as usual. Eighty-nine members of the teaching and research staff of the university and colleges entered the fighting services or undertook other temporary work of national importance.

Pacific Islands, British. Territories of the British Empire in the Pacific ocean, which certain statistics are given in the table. See BRITISH EMPIRE for population, capital towns, status and governors.

History.—The European war, with its repercussions in the Dutch East Indies and on the Thailand-Indo China frontier coupled with doubts as to the intentions of Japan, did not make for stable conditions but did not seriously retard progress. Every island contributed generously to British war funds; each put itself in a state of defence; and in Fiji, after a voluntary defence force had been formed, it was necessary to prohibit men going to New Zealand and Australia to join up and for the imperial government to refuse an offer of an expeditionary force on the ground that Fijian man power would be more useful at home.

Fiji suffered from the decline in the tourist traffic, but gold mining and the new pineapple industry became increasingly important and the promised use of Suva as a port of call for Pan American Airways augured well for future prosperity; lack of markets for copra led to government consideration of new industries, including bacon-pigs for export, poultry and egg production, and the extension of dairying, and experiments were made in the use of coco-nut oil in the running of diesel engines. The foundation stone of the Anglican cathedral at Suva was laid by Sir Henry Luke, the erection of a hospital with medical school, etc., at Ba at a cost of £78,500 was approved and a new post office and telephone exchange opened at Lautoka. Public broadcasting news in Fijian, English and Hindi was introduced.

In the Gilbert and Ellice group the fight against filariasis, yaws (which has almost disappeared) and other tropical diseases was maintained; and on Canton hotels, stores, etc., were erected for Pan American Airways.

In New Guinea work was continued on the construction of the road from Salamaua on the coast to Wau, and a report on a 20,000 sq.mi. exploratory patrol in the northeast highlands described it as a country with a golden future, much of the land being suited to European settlement. In March Papua lost, through death, Sir Hubert Murray, its first governor, who had administered the colony for 34 years; he was a noted anthropologist, and the extinction of cannibalism and cessation of tribal warfare in the country were due to his wise rule. In the New Hebrides R. D. Blandy succeeded G. A. Joy as resident commissioner.

Pacific Relations, Institute of. The institute is an in-
ternational organiza-
on founded in 1925 for the study of the peoples of the Pacific
d their mutual relations. It conducts an extensive research and
ucational program, and publishes its studies through an inter-

national publications office, and
through each of its national
councils; it produces a quar-
terly magazine, *Pacific Affairs*.
Since 1937 it has carried on an
international inquiry into prob-
lems arising from the Sino-
Japanese conflict. The last
international meeting of the
institute was held in Nov. 1939,
at Virginia Beach, Va. Acting
chairman of the Pacific coun-
cil, governing body of the in-
stitute, is Prof. Philip C.
Jessup. Offices of the interna-
tional secretariat are tempo-
rarily at 129 East 52nd street,
New York city. Below are the
11 member organizations:

The American council, In-
stitute of Pacific Relations, 129
East 52nd street, New York
city. Royal Institute of Inter-
national Affairs, Chatham house,
St. James's square, London,
S.W. 1, England. Australian Institute of International Affairs,
53 Martin place, Sydney. Canadian Institute of International
Affairs, 3 Willcocks street, Toronto. China Institute of Pacific
Relations, P.O. Box 1688, Kowloon, Hongkong. Comité d'Études
des Problèmes du Pacifique, Lycée Blaise-Pascal, Clermont-
Ferrand, France. Japanese council, Institute of Pacific Relations,
Nihon Kokusai Kyokai, 12, 2-chome, Marunouchi, Tokyo.
Netherlands-Netherlands Indies council, Institute of Pacific Re-
lations, 18 Warmonderweg, Oegstgeest bij Leiden. New Zealand
Institute of International Affairs, P.O. Box 36, Wellington.
Philippine council, Institute of Pacific Relations, Vicente Mad-
rigal & Co., Muelle del Banco, Manila. U.S.S.R. council, Pacific
Institute, 20 Razin street, Moscow. (F. V. F.)

Pacifism.

Pacifism is a system of beliefs in the desirability
and possibility of permanent peace. This belief may
be based on liberal-humanitarian, rational-cosmopolitan or reli-
gious grounds. It always presupposes a belief in the essential unity
of mankind and in the sanctity and dignity of individual existence.

It is thus completely opposed to fascism which denies the one-
ness of mankind and the dig-
nity of the individual and
which regards permanent peace
as neither possible nor desir-
able, because war alone,
according to fascism, awakens
the highest moral response in
man. The communist attitude
rejecting only certain wars
which they label "imperialist"
or "capitalist," cannot be re-
garded as pacifist, although
communism foresees as an ulti-
mate ideal a pacifist and uni-
fied society. Entirely unpacifist
is the isolationist or neutral

attitude, which is based upon the sole consideration of national
self-interest, and does not reject war on principle, but only if it
does not involve the nation's own honour, security or wants. An
isolationist or neutral attitude is unpacifist also because it does
not point any way towards the establishment of a peace embrac-

TRIBUNAL for conscientious objectors in session at London in 1940

ing all nations on a permanent structure of international law.

Pacifism can be either "absolutist," rejecting all and every kind of war under every circumstance, or "juridical," aiming at settling all disputes between nations judicially, by the authority of international law, backed by the necessary power. Absolutist pacifists are represented by a number of war resisters and religious groups.

Their members refuse military service as "conscientious objectors."

Following the outbreak of the European war, the British government in 1939 and, with the introduction of compulsory military service in 1940, the United States, took this attitude into consideration and recognized it officially. Conscientious objectors received the right to argue the sincerity of their convictions before special tribunals and be then assigned to non-combatant service and exempted from military duties. In spite of the fact that Great Britain found herself in the midst of a life-and-death struggle in 1940, she and Canada put no restriction upon any form of pacifist propaganda.

Pacifism, which believes in attaining peace by concerted peace efforts of all peace-loving nations, believes that no nation can be assured of living its own life in peace in a world of lawlessness and anarchy. It therefore affirms the necessity for all nations to co-operate in the organization of an international community for concerted action to oppose aggression. It regards isolationism as one of the fundamental obstacles to such an establishment of a peaceful order. The war, which in 1940 saw attacked many nations anxious to remain isolated and neutral, and saw many of them disappear as independent nations (in 1940 eleven neutral nations were attacked outright or in one way or another [wholly or in part] annexed), strengthened the conviction in many circles of the necessity of establishing a strong international order.

The proposal of *Union Now* made by Mr. Clarence Streit for a federation of all democratic nations found itself, as a result of events, reduced to a proposal for a union of the English-speaking nations to withstand the common danger of a fascist-dominated world and to lay the foundations of a lasting peace and of civilized order. With the spread of the war the demand for a lasting peace grew as it had during the war of 1914-18, but this time the determination grew, too, not to let the opportunity go by default, as had happened after 1918 by the refusal to enter or to use the League of Nations. (See also INTERNATIONAL LAW; RELIGION.)

Painting. The year 1940 was marked by two developments which will undoubtedly have an important influence on future trends in American painting. On one hand, the influx of prominent artists from Europe was notably increased; on the other, an energetic, propagandist effort was initiated to awaken and increase interest in western hemisphere art.

The movement of painters from east to west had been going steadily for the past decade. In fact one may even see its origin in the early 1920s when the Russian soviet's discouragement of the Moscow constructivists and so-called "formalistic" painters led to the dispersal of many of their leaders through Germany and France. During the 1930s Nazi Germany's campaign against the unconventional in pictorial expression as "degenerate art" swelled the movement. For several years Great Britain had provided a handy haven of refuge and enjoyed a considerable stimulus from the influences driven to its hospitality. With Britain a centre of war the United States became the obvious resort. Already several well known European artists and many younger experimenters had settled in the U.S.A.: among others Pavel Tchelitchew, L. Moholy-Nagy, Amedée Ozenfant, Jean Hélion, Yves Tanguy, Matta Etchaurren and Kurt Seligmann. During 1940 these were followed by the Spanish surrealist Salvador Dalí, the Dutch neo-plastician, Piet Mondrian and Fernand Léger. Wyndham Lewis, the well known British critic and former vorticist painter, spent several months in the United States during the spring and summer of 1940, painting, writing and lecturing; and in the autumn the etcher, William Hayter, opened a class at the New School for Social Research in New York where Amedée Ozenfant was also lecturing.

At the same time throughout the United States many ambitious exhibitions of Mexican, Central American and South American works were arranged. The Riverside museum in New York city, one of the pioneers in this field, in the summer of 1940 held an exhibit of work from five Pan-American countries: Ecuador, Venezuela, Brazil, Mexico and the Dominican Republic. At the same time, in San Francisco, the Golden Gate exhibition was showing a special Pan-American display representing Colombia, Chile, Costa Rica, El Salvador and Peru. The Virginia Museum of Fine Arts at Richmond held a large exhibition dedicated solely to Argentine art; and in Denver was shown a comprehensive display of 16th, 17th and 18th century paintings of the school of Cuzco, Peru. During the late spring and summer months the Museum of Modern Art in New York city held an exhibition of 2000 Years of Mexican Art. In the autumn the same institution gave a generous one-man show to the Brazilian painter Cândido Portinari; while a large exhibition of the work of the Colombian, Luis Alberto Acuña was held in San Francisco.

Another feature of note in 1940 was the diminished emphasis on "American scene" and "regionalist" interests in subject matter. And by the end of 1940 the curtailment of the WPA arts project patronage which was already pinching in 1939 had practically rendered that organization ineffectual. To make partial amends to the artists for the diversion of funds from the WPA to uses the government felt more immediately urgent, the administration instituted a national art week. This was planned to stimulate a market for native artists' work; but the apparent inexperience of its active organizers in many centres seriously limited its benefits.

In the creative field, in the season of 1940 just as in that of 1939, it was possibly the veteran John Marin who provided some of the most gratifying achievements: and once again seascapes in oil—in 1940 on the New Hampshire coast. Each year sees Marin a growing mastery of this medium to which he has given his prime attention so late in life. And in these oils one finds all the vitality and spontaneity of his water colours with

"SAILOR FROM H.M.S. VERNON," by Eric Kennington, commissioned by the British admiralty in 1940

"DEATH FROM THE AIR," by Georges Schreiber, American, records the fears of crew members aboard a British munitions ship during an attack by a German bomber

THOMAS HART BENTON'S "No More Sea for Me" was a notable war painting of 1940. It pictures a crew refusing to risk the dangers of shipping in wartime. This canvas and "Death from the Air" were purchased by Walter Wanger for exhibition throughout the United States

"RETURN OF H.M.S. EXETER" by Charles Cundall, A.R.A., painted and purchased officially in 1940. The "Exeter" was one of the three British cruisers which won the victory over the German pocket battleship "Admiral Graf Spee" in Dec. 1939

steadily growing power of definition—an added warmth and richness of colour and an increased feeling for the structure of the whole. Another well known exhibitor at Alfred Stieglitz's An American Place, who brought a new note into her work in 1940 was Georgia O'Keeffe. In her 20 paintings of Hawaiian flora commissioned by the Dole Pineapple company one marked an unusual freshness. No sacrifice of her characteristically meticulous workmanship was evident. Still in these canvases there was a luxuriance with a suggestion of freedom that left a promise of new paths that might be explored.

However, if Marin's consistently more profound mastery of the oil medium and O'Keeffe's new warmth and richness were among the high points of the year's production, several younger artists and even newcomers were not without their marks. Probably no American artist in several years has received a broader and more deserved recognition for his work from a single small exhibition than Julian Levi for his spring offering at the Downtown gallery in New York. It was evident that here was a man with deep knowledge of craftsmanship, and an instinct for colour effects and structural organization that allowed him to speak freely in paint without any danger of producing a slipshod untidy expression. From this showing one had an impression of spontaneity together with the sense of an essential compositional integrity in his painting; and both these effects were combined by a bright sunny palette that gave nothing, however, to shallowness for the sake

of vivacity.

At the other pole of expression there was the exhibition Charles Sheeler's six studies in oil on the subject of "Power" commissioned in 1938 by *Fortune* magazine and shown in the fall of 1940 at the Downtown gallery. In these canvases Sheeler retained all the tight spotlessness of his machine depictions. In later years Sheeler's expression has been shrinking scrupulously to a more and more minute elegance. But here it would appear that at a single bound he has shaken off this temptation. And in this sense he seems to have completely recovered his earlier breadth without surrendering any of the confidence his effects of microscopic veracity brings. At the same time he has immersed his forms in a suffused light that gives them a new mellowness. The result is that these six studies have a strength and sensibility that linked to Sheeler's old impeccable craftsmanship put them high among that artist's work, if not at the top.

In another world from both the sensuality of Julian Levi's work and the Puritanism of Sheeler's stands the 1940 sculpture of Alexander Calder. And while Calder's talent is never without surprises, his exhibition at the Matisse gallery in the spring of 1940 "Mobiles and Stables" showed a new and important step toward the monumental in metal sculpture. The forms, if anything, had become more personal. Whatever notes reminiscent of Paris mobiles occasionally have cropped out in earlier expressions, here had entirely disappeared. The nature of his materials and his mode of construction had more closely prescribed the shapes here than in any work to date. The gay colours of his earlier mobiles had given way for the most part to a mat block, more reserved and, at the same time, more authoritative. (See SCULPTURE.)

Among the lesser known younger artists Loren MacIver in her exhibition of delicately drawn fantasies at the Pierre Matisse Galleries in December offered perhaps the most interesting promise of the year. She is rich in imagination and courageous in the use of it. However, her colour is still not sure enough. She apparently lacks a confidence in her ability to handle a strong gamut and tries to make up for it by a stress on quality and sensibility. Another artist who is likewise strong in sensibility but shares MacIver's timidity of colour is Milton Avery. His exhibition at the Valentine gallery during the spring had a definite charm and was rich in suggestive quality but lacked an essential vitality. On the other hand, in the work of Ernest Fiene who in the spring of 1940 held his large first one-man show since 1935, and in Marsden Hartley's Maine landscapes shown at the Walker galleries, one found an abundance of vitality together with a lack of feeling for nuances of colour and for restraint. And in the work of Benno, just back from Paris, one felt an interesting richness of compositional and technical ingenuity joined to lack of self-criticism.

In New York during 1940 the non-objective painters and sculptors enjoyed increased exhibition opportunities. The Museum of the Art of Tomorrow gave over a small space to periodic showings of non-objective painters. Of this group one of the most consistently interesting was John Xceron. The group of American Abstract Artists in 1940 held their annual exhibition in the large galleries adjoining the Art Students league including the work of architects as well as painters and sculptors. Of the paintings shown, the most striking was a composition by Alice Mason. Ilya Bolotowsky and Balcomb Greene also contributed characteristic work.

However, by far the most interesting display of contemporary non-objective work was that shown at the St. Etienne gallery. Here broad catholicity of inclusion brought together work by

FOUR MURAL PANELS tracing the history of printing, painted by Edward Laning, were completed in 1940 for the New York public library

art Davis, Albers, Moholy-Nagy, Rice-Pereira, G. L. K. Morris, Susie Frelinghuysen, Charles Smith, Burgoyne Diller and Paul Feininger. Moholy-Nagy's constructivist relief with its emphasis on the play of lights, shades, colours and textures, was by the most competent and satisfying of the work exhibited; while Burgoyne Diller's translation of the two-dimensional effects of neo-plasticism into a three-dimensional construction is perhaps the most suggestive contribution of the younger artists.

In the deaths of Ernest Peixotto and of Jonas Lie, American painting in 1940 lost two of the figures of the older generation known for their activities on behalf of their fellow artists; in that of Jerome Myers, one of the best known members of the group which included the late Glackens and Luks and was tied in its work so intimately with the New York of the opening of the century. (J. J. Sw.)

Paints and Varnishes. United States sales for the year 1940 showed a slight increase over 1939. Industrial sales showed more gain than trade sales during the year.

Pigments showed continued improvement in quality. The alkali-retardant types of titanium oxide particularly have better colour. Phthalocyanine blues and greens became more and more popular. Among the inorganic colours the chrome and molybdate pigments with improved light fastness became available. The anthracene and cadmium colours became increasingly popular, especially for automotive finishes. The ease of dispersion of many pigments was greatly improved. This was secured through surface-treatment, more selective mechanical separation, and, in the case of certain mineral pigments, through micronizing.

Vehicles in general received a great deal of attention during the year. In oils, dehydrated castor and the re-esterified fish oil showed greatly increased consumption as replacements for imported China wood and perilla oils. Considerable attention is given to the utilization of petroleum products as the basis for synthetic drying oils for the industry. Removal of natural antioxidants from soybean oil received particular attention.

A synthetic dibasic anhydride prepared from cyclopentadiene and maleic anhydride appeared as a replacement for phthalic anhydride in the popular alkyd type of resin.

In the heat-convertible resin field melamine formaldehyde has gone forward as a replacement of the urea formaldehyde type for baking goods, particularly whites. Among painter items improvements were made in reducing the odour of paints. More and more non-penetrating types of materials have appeared for use on porous surfaces, such as calcimined surfaces.

In the industrial field much attention was given to the subject of infrared baking. This type of baking, inaugurated by the motor industry several years ago, made tremendous gains in popularity during 1940. In general, it was most effective when used in conjunction with heat-convertible resins such as the urea or melamine types, although results could be secured with those materials that gained hardness by oxidation. A wide variety of oven design was available to accommodate the type of article and nature of finish desired. Both low-temperature tungsten and carbon filament bulbs were used in conjunction with several types of reflecting surfaces.

During 1940 the industry contributed to the defence effort in developing and supplying fast-drying finishes for all divisions of the armed forces. Particular emphasis was placed on non-reflecting types of paints such as lustreless olive drab for motorized equipment, helmets, etc. A variety of matte colours was available for aircraft camouflage.

Palaeontology. In the United States many contributions have been made to the advancement of vertebrate palaeontology. William B. Scott and Glenn L. Jepsen published *Artiodactyla*, a notable contribution to a knowledge of this portion of the Oligocene mammalian fauna of North America. This extended work is embellished by 42 excellent plates illustrating the more important skeletal parts of the various animals discussed in the text. Glenn L. Jepsen described five new genera and eight new species of Palaeocene mammals from a northern Wyoming locality. It is pointed out that the geological section here contains the approximate equivalents of the major Palaeocene faunas known elsewhere. George Gaylord Simpson contributes a series of eight brief studies on Palaeocene and Eocene primates. New genera and species are described, relationships of certain forms are discussed and their classification revised. C. Bertrand Schultz and Charles H. Falkenback published on the Merycoidocrinae. This is the first of a proposed series on the Merycoidodonts of North America, each subfamily to be treated separately. The abundance of materials at their command assures the importance of this contribution. Charles W. Gilmore published a short paper characterizing two new fossil lizards from the Upper Cretaceous of central Utah. The identification of these forms is unique in the order Sauria. O. C. Marsh, *Pioneer in Paleontology*, by Charles Schuchert and Clara M. LaVene, is a volume of great interest to all palaeontologists. The story of Marsh is in some respects the tale of the growth of science in American universities. It is a most candid and dispassionate evaluation of Marsh as a man, his relationships and accomplishments.

A large, toothless bird *Caenagnathus collinsi* from the Upper Cretaceous of Alberta, Canada was described by R. M. Sternberg. It is referred to the new order *Caenagnathiformes*. Its large size suggests it to be a flightless bird that lived in an upland habitat. A revised edition of *A Systematic Classification for the Birds of the World*, by Alexander Wetmore, includes all known fossil birds and for that reason is of interest to palaeontologists.

In Russia, A. P. Bystrow and J. A. Efremov published a complete osteological description of *Benthosuchus sushkini*, a labyrinthodont from the lower Triassic. The specimens forming the basis of this study came from Sharzhenga river, a tributary of the Yuk in the North Dvina region.

In Japan, Shigeyasu Tokunaga and Fuyuji Takai completed a study of the Pleistocene antlered mammal *Metacervulus astyodon* from the Pleistocene of the Ryukyu islands. An abundance of materials enables them to discuss practically the entire skeleton.

In invertebrate palaeontology, C. W. Merriam revised the Devonian faunas of the famous Eureka district of Nevada. Special attention was given to establishing these faunas in the geological section. This work thus modernizes the palaeontological information of this area. A considerable number of new species are described. A. K. Miller and W. F. Furnish reviewed the Permian ammonoids of the Guadalupe mountain region of western Texas and adjacent areas. Some new forms were also described. The publication of a revised third edition of *Foraminifera, their Classification and Economic Use*, by Joseph A. Cushman, is a volume of interest to students and specialists alike.

The discovery of additional materials of early man in the Sangiran district of Java enabled Dr. Franz Wiedenreich to present a new restoration of the *Pithecanthus erectus* cranium. He concludes that there is now no doubt that it represents the most primitive man yet discovered. (See also GEOLOGY; ZOOLOGY.)

Palestine. Palestine lies on the western edge of Asia, being bounded on the west by the Mediterranean, on the southwest by Egypt, on the south by the gulf of Aqaba, on the east by Trans-Jordan, on the northeast by Syria and on the north by the Lebanon. Area 10,429 sq.mi.; (water 272 sq.mi.); pop. (est. June 30, 1939) 1,466,500; immigration 1938: Jews 12,868; Arabs 473; others 1,922. Chief towns: (pop. est. 1939): Jerusalem (cap. 129,800); Haifa (104,800); Jaffa (77,400); Tel-Aviv (130,300). High Commissioner: Sir H. A. MacMichael, K.C.M.G., D.S.O.; languages: English, Arabic, Hebrew; religions: (1939) Mohammedan 848,933; Jewish 424,373; Christian 114,624.

History.—The complete cessation of unrest, which marked the last quarter of 1939, continued throughout 1940 with the exception of a short interlude at the beginning of March when Jewish demonstrations took place in consequence of the promulgation on Feb. 28 of the regulations provided for in the *White Paper* for the delimitation of zones in which sales of land would be restricted, prohibited or remain free.

In view of the improvement in the state of public security the high commissioner announced that all offences prior to June 15 would not come before the military court and that the death penalty for carrying arms without licence would be abolished.

Palestine felt the first direct effects of the entry of Italy into the war on July 15, when the first air-raid on Haifa took place. This was followed on July 24 by a second, which caused 100 casualties, and on Aug. 6 by a third. On Sept. 9, Tel-Aviv was raided and over 100 casualties were caused.

Recruiting during the year proceeded apace for the ground forces of the royal air force, and for auxiliary pioneer companies, one of which went out to France in the spring. On July 2 the decision was announced to form artisan workers companies for the royal engineers, a line section for the royal corps of signals and mechanical transport companies for the royal army service corps and additional pioneer corps. And in September Palestinians were called upon to offer their services for the defence of Palestine in combatant units. Enlistment was very brisk among both Jews and Arabs. The second Australian imperial force began to arrive in Palestine in February.

There was a considerable decrease of immigration due partly to the small number of certificates granted and partly to the very reduced number of Jews left in the European countries from which the bulk of immigrants had hitherto come. Applicants for certificates had to prove that they had no longer been in enemy countries in Sept. 1939. The falling off in immigration can be gauged from the fact that, whereas the total during the first half year of 1939 was 11,911, in the same period of 1940 it was only 3,933, the Jewish proportion falling correspondingly.

Unemployment was remarkably low, considering the serious economic situation caused by the war. This satisfactory feature was due largely to the construction of roads and camps for the army, to the carrying out of the extensive barrack-building program for the police and to recruiting.

The granting by the British government of £P.750,000 for relief work materially assisted also. These loans were granted to all municipalities including Tel-Aviv, Haifa, Jaffa and Jerusalem, to small Arab villages and to small Jewish colonies for the carrying out of public works. The government finances remained sound. The actual income for the first half of 1940, if one leaves out of consideration the Colonial Office grant-in-aid, was higher by £P.400,000 than during the same period of 1939.

Import trade during the first half of 1940 was fully up to the 1939 standard. In view of the war, merchants decided to accumulate stocks and more raw material was required to enable local industries to meet military needs and for the new industries

created to provide manufactured articles hitherto supplied from abroad. The economic situation was, however, aggravated by the difficulty experienced in exporting the citrus crop which became the staple crop of the country. Only 7,500,000 cases, half the quantity exported the previous season, were shipped. The bulk of the cases went to the United Kingdom.

In March all the finance regulations in force were consolidated. Palestine belonging to the sterling block, transfers between the Empire and Palestine are free and it was for this reason that movement took place to get the British government to arrange the taking over by British brokers of the citrus crop in the same way as had been arranged for the cotton crop in Egypt.

On April 16, the government announced that to assist the Palestine citrus industry it would under certain conditions guarantee advances made to citrus growers. This guarantee was limited to half the loans granted to citrus cultivators during the coming season. At the same time a reduction in the rural-property tax from £P.40 to £P.15 was accorded to estates devoted to citrus cultivation. In July a draft bill for a citrus control board was promulgated. It provides for 100% control of the industry from the tree to the broker abroad and will regulate the area under citrus cultivation, the quality of the fruit, standards of packing, grading and marketing, shipping and export allocation.

During the year an industrial production advisory board was formed to utilize local industrial enterprises to the fullest advantage for civil and military purpose, to control the import and supply of raw material and the price of local manufactures and to advise the military and civil administration regarding contracts for supplies and the extent to which they can draw on local resources. An indication of the increased industrial activity in Palestine during the first half of the year is afforded by the fact that the consumption of electricity expanded from 35,500,000 to 48,000,000 kw., the sales of power to industries increasing from 10,700,000 to over 18,000,000 kw.

Another curious statistical feature due no doubt to the war and the greater tendency of the public to listen in for news, is that the number of radio sets in use rose from 15,000 in 1935 to 46,600 in 1940.

Palestine did not fail to be affected by the events in Syria. The closing of the frontier materially affected economic relations as the two countries are in many respects inter-dependent. Conversations were proceeding for some *modus vivendi* which would enable trade intercourse, particularly in agricultural products, to be resumed.

Italian and German propaganda was very active, as elsewhere in Arabia. The fighter aircraft fund organized by the Jewish newspaper the *Palestine Post* may be regarded as a practical proof of the failure of enemy propaganda and of the will to assist the whole community of Palestine. It produced a sum of over £P.30,000, to which both Arabs and Jews freely contributed. The success of the appeal was all the more remarkable in view of the economic situation of Palestine. (A. M.N.)

Education.—1937-38: Arab public system maintained by government, 402 schools (11 with secondary sections), 49,000 scholars; Moslem schools, private 184 (2 with secondary sections) with 14,052 scholars; Jewish schools 662 (including 6 training colleges and 27 secondary, 14 technical and 13 agricultural schools) with 71,376 scholars; Christian schools 193 with 24,046 scholars; Hebrew university, Jerusalem; 75 teachers, 733 students.

Banking and Finance.—Revenue and expenditure (est. 1939-40) £P.7,073,733; public debt (March 31, 1939) £P.4,475,000; surplus balance (April 1, 1939) £P.2,533,265; notes in circulation (June 30, 1939) £P.5,931,967; exchange rate: £P.1=£1 sterling.

Trade and Communication.—Overseas trade 1939 (merchandise): imports (excluding military stores) £P.14,632,822; exports

esthetic £P.5,117,769. Communications and transport 1939: ds. all weather 1,110 mi.; seasonable about 1,100 mi., railways, standard gauge 334 mi.; narrow 270 mi.; airways (1938): sengers 600, mail 86.9 tons; shipping, 1938 entered 1,971 sels; 5,201,473 net tons. (Dec. 31, 1938) Motor vehicles lised: 3,935 private cars, 1,031 public cars, 750 buses, 2,592 cks and vans, 1,182 cycles; wireless receiving set licences 708; telephone subscribers, number 9,241.

Agriculture and Minerals.—Production 1938 (in metric s): potash (exports) 50,288; oranges (exports 1938-39) 13,420 cases, (value) £P.3,865,292; barley 66,736; wheat (1938) 135; (1939) 136,100; olive oil (exports) 78,977; melons and ermelons 114,805; grapefruit (exports 1938-39) 2,066,833 es, (value) £P.445,148; wine 31,000 hectolitres; maize 8,000; acco (1937) 2,500; potatoes (1937) 9,500; sesamum 4,000.

Palmer, Emma Nevada: see NEVADA, EMMA.

Panamá, a republic at the juncture of Central and South America; language, Spanish; capital, Panamá; president, Arnulfo Arias; area, including the Canal Zone (under United States jurisdiction) is 34,169 sq.mi. The population (1930 census: 467,459) was officially estimated at 547,536 in 1937. Results of the Sept. 8, 1940 census had not been made public at the end of the year, but semi-official estimates were 625,000 to 650,000, not including the Panama Canal Zone (1940 census: 82,827. The chief cities (with 1930 pop.) are: Panamá, 82,827; Colón, 33,460; Penonomé, 16,074; David, 16,004. Throughout 1940, Panama was unsettled politically. A bitter campaign preceded the June 2 presidential elections. Just before the elections, the opposition candidate, former president Ricardo Alfaro, withdrew, charging that frauds made free election impossible. Dr. Arnulfo Arias, 39-year-old administration candidate, was elected without formal opposition, and assumed office Oct. 1. One of his first acts was to push through a new constitution, effective Jan. 2, 1941. This changed the presidential term from 4 to 6 years, disfranchised non-Spanish-speaking negroes, prohibited further immigration of Asiatics or Africans, and generally strengthened presidential powers. Legality of the procedure followed in adopting the new constitution was strongly challenged by opponents.

During 1940, strong action was taken against "fifth column" activity which threatened the Panama canal defence program. United States expenditures on additional canal defences and ending of a heavily increased canal personnel stimulated business in the republic, and was considered to have more than offset losses from a decline in tourist trade, normally a major source of national income.

In 1939 there were 257 mi. of railway and 1,169 km. of highway. Panama's strategic geographic position makes her the hub of inter-American air and maritime transport. In 1940 construction has begun on the highly important intercoastal highway; when completed this will connect Panamá and Colón by road for the first time. A United States Import and Export Bank loan of \$100,000,000 made possible continued work on incomplete sections of the Pan-American highway. Panama's merchant marine, one of the largest in Hispanic America, has trebled since 1938, and totalled in 1940 nearly 200 ships aggregating close to 900,000 gross tons.

Imports, chiefly textiles and foodstuffs, were \$20,464,000 in 1939 (a 16% increase), with the United States supplying 58.2%, Japan, 9.8%, Germany 7.9%. Exports (exclusive of \$3,339,000 re-ports) declined 7% to \$3,487,000 (85.8% to the United States). Bananas comprised 79%.

In 1939 there were 629 primary schools (544 rural), with 61,706

pupils and seven secondary schools (3,830 enrolment). The National university (411 students in 1939) is at Panamá. Panamá has no army or navy, but maintains a national police force of 1,200.

The monetary unit, the balboa, is equivalent to the United States dollar. (See also HISPANIC AMERICA AND THE EUROPEAN WAR.) (L. W. BE; L. C. DE A.)

Panama Canal and Canal Zone. Area, 552.95 sq.mi., of which 190.94 are water; population, as of the 16th decennial census taken April 1, 1940, inclusive of army and navy personnel, 51,827, of whom 32,390 were United States citizens. The length of the canal from shore line to shore line is 40.27 miles. Both canal and zone are under the jurisdiction of the United States.

The Panama canal connects the Atlantic and Pacific oceans through the narrow isthmus of Panama, at approximately 9° N. lat. and 79° W. long.

It was opened to traffic on Aug. 15, 1914.

Revenues for the fiscal year 1940, principally from tolls, totalled \$22,329,610 and the net appropriation expenses were \$10,041,950, which left a net revenue of \$12,287,660, or a return of 2.42%, to the U.S. government on its investment in the canal enterprises. The gross capital investment as of July 1, 1939, was \$543,150,445, and the net investment, after deducting reserves, \$508,107,922.

An interest return of 3% on the capital investment would have been \$15,243,238 from the year's operations, or \$2,955,578 more than was actually realized.

During the fiscal year ended June 30, 1940, there were 5,370 transits of ocean-going commercial vessels in comparison with 5,903 in the fiscal year 1939. Of the total number of commercial transits during the fiscal year ended June 30, 1940, 1,997 were of the United States registry, 1,073 British, 557 Norwegian, 340 Netherlands, 272 Japanese, 243 Panamanian, 175 Greek, 174 Danish, 110 Swedish, 93 French, 81 Honduran, 55 German, 46 Italian, 38 Chilean, 27 Yugoslav and the remaining 89 of 14 other nationalities.

The origin and destination by principal trade areas of cargo in vessels passing through the Panama canal during the fiscal year ended June 30, 1940, is shown in the following table:

From Atlantic to Pacific		From Pacific to Atlantic	
	Cargo, tons		Cargo, tons
United States intercoastal	2,795,708	United States intercoastal	4,918,629
United States and Far East (including Philippine Is.)	3,266,445	Far East and United States (including Philippine Is.)	1,589,165
Europe and South America	259,700	South America and Europe	1,474,874
Europe and Canada	44,402	Canada and Europe	2,006,622
Europe and United States	192,374	United States and Europe	1,099,296
East coast United States and west coast South America	501,511	West coast South America and east coast United States	2,757,412
Europe and Australasia	268,143	Australasia and Europe	864,701
United States and Australasia	487,896	Australasia and United States	135,639
All other trade routes	2,003,421	All other trade routes	2,624,078
Total	9,819,600	Total	17,470,416

During 1940 there was a great increase in local activity in the Canal Zone. The total force employed by the Panama Canal and Panama Railroad company in June 1940 was 5,258 on the "gold roll," and 18,891 on the "silver roll." As compared with June 1939 this represents an increase of 1,747 or 41% on the "gold roll," and an increase of 7,645 or 68% on the "silver roll." The terms "gold roll" and "silver roll" originated during the construction period of the canal from the practice of paying the American skilled labour in gold and the paying of the native unskilled labour in silver. This classification has been continued to the present time, although all employees are now paid in U.S. currency.

The gold roll comprises the supervisory, technical, higher clerical and highly skilled mechanical employees; these employees are, with a few exceptions, citizens of the U.S.

Traffic through the Canal for the Last Twelve Fiscal Years

Fiscal year ending June 30	Southbound (Atlantic to Pacific)		Northbound (Pacific to Atlantic)		Total		Tolls levied
	Vessels*	Cargo, tons	Vessels*	Cargo, tons	Vessels*	Cargo, tons	
1929	3,279	9,873,529	3,010	20,774,230	6,289	30,647,768	\$27,111,125
1930	3,051	9,472,061	2,976	20,546,368	6,027	30,018,429	27,059,999
1931	2,717	6,670,718	2,653	18,394,565	5,370	25,065,283	24,624,600
1932	2,273	5,631,717	2,080	14,167,269	4,352	19,798,986	20,604,705

1940	2,763	9,819,600	2,607	17,479,416	5,370	27,299,016	21,144,675

*Ocean-going commercial vessels, over 300 net tons Panama canal measurement, excluding canal vessels, Army and Navy, Panamanian Government, Colombian Army and Navy vessels.

The force of silver employees is comprised almost entirely of natives of the tropics, a considerable number of whom are Panamanians.

The principal commodities transported through the canal during the fiscal year ended June 30, 1940, segregated by direction of transit, were as follows:

From Atlantic to Pacific		From Pacific to Atlantic	
	Long tons		Long tons
Manufactures of iron and steel	1,837,593	Lumber	3,669,482
Mineral oils	1,294,886	Ores	2,165,646
Scrap metal	968,045	Mineral oils	2,014,237
Paper and paper products	304,021	Sugar	1,455,683
Sulphur	353,452	Nitrate	1,361,422
Coal and Coke	330,542	Canned food products	1,248,059
Metals, various	316,627	Metals, various	706,001
Cotton, raw	277,978	Wheat	611,961
Tinplate	243,784	Food products in cold storage	
Phosphates	220,647	(except fresh fruit)	444,291
Machinery	205,210	Fruit, dried	275,637
		Wood pulp	275,350
		Oils, vegetable	211,457

This increase in local activity evidenced by the working force is due to the construction activities on the Canal Zone for national defence projects of the U.S. army and the U.S. navy, and the project for the improvement and enlargement of the capacity of the Panama canal by the building of the third set of locks. This latter project involves the construction of a complete new set of locks at Gatun, Pedro Miguel and Miraflores, with by-pass channels paralleling the existing facilities. Preliminary studies on this project were begun in the fiscal years 1939 and 1940, and with the passing of the congressional appropriation on June 24, 1940, construction work on the third locks project was officially inaugurated on July 1, 1940, the first day of the fiscal year 1941. (G. E. ED.)

Pan-American Highway: see BOLIVIA; COSTA RICA; GUATEMALA; HONDURAS; NICARAGUA; PANAMA; PERU; ROADS AND HIGHWAYS; SALVADOR, EL.

Pan American Union, an international body created and maintained by the 21 western hemisphere republics for the fostering of good understanding, friendly intercourse, commerce and peace; headquarters, Washington; director general, Dr. Leo S. Rowe.

On April 14, 1940, the Pan-American union celebrated its 50th anniversary.

During 1940 the most outstanding union activity was the second meeting of the ministers of foreign affairs of the American republics, held at Havana, July 21 to 30 (see HISPANIC AMERICA AND THE EUROPEAN WAR). Throughout the year the Inter American Financial and Economic Advisory committee, created at the first meeting (at Panama City, Sept. 1939) continued to function. It formulated a convention creating an Inter American bank and was responsible for the important Inter American Coffee Quota agreement of Nov. 1940 (see BRAZIL). Under its auspices

an Inter American Maritime conference was held at union, Nov. 25 to Dec. 2.

Several other union-sponsored inter-American conferences were held during 1940, including the Fourth Pan American Red Cross conference (Santiago, Chile, Dec. 5 to 11) and the committee of experts on nature protection and wildlife protection, at Washington in May, which drafted an international convention approved by 12 republics.

fore the end of the year.

Sixteen inter-American conferences and congresses were scheduled to be held during 1941. These included the regional conferences of Río de la Plata countries (Montevideo, Jan. 1), an Inter-American Writers conference (Río Piedras, Puerto Rico, April 14), and the Fourth Pan American Highway congress (Mexico City, Sept. 15 to 24), as well as meetings devoted to other special problems. The union is financed by contributions from member republics on a population basis. It has several important subdivisions devoted to specialized activities, including a division of labour and social information established Jan. 1, 1940.

Paper and Pulp Industry. The pulp and paper industry in the United States in 1940 was featured by the war conditions and increased business resulting therefrom. Paper production in Dec. 1939 was at about 91% of capacity and by Oct. 1940 was 88.5%. Paperboard during the same period rose from 70% to 74%. During 1940 three new mills were brought into operation; a newsprint mill at Lufkin, Tex., a cigarette paper mill at Brevard, N.C., and a kraft mill at Mobile, Ala. There was in 1940 considerable expansion of existing mill properties.

Canada.—Business conditions in Canada reflected world conditions and in particular those of the United States, where so much asprint is sold. Business started in 1939 under strong conditions and has been improving. Although prices were increased, they were offset considerably by the rising costs of raw materials, etc. Board mills had an excellent year, particularly consumers for the retail trade.

There was no new mill construction during 1940. There was, however, some expansion in existing mills.

One-sixth of the value of the gross exports from Canada is represented in pulp and paper.

United Kingdom.—The paper business in 1940 in the United Kingdom felt the effects of war, and production was drastically curtailed by government decree. To meet the demand for raw materials to replace wood pulp and esparto, intensive efforts were being made to gather as much waste paper as possible for use in making papers, largely for government use.

Although no official statistics have been issued since 1935 by the board of trade, those in Table IV for 1938 and probably for 1939 (in long tons) are about correct in so far as the use of

Table IV.—Raw Materials in Paper Production, Great Britain

Material in Long Tons	Paper	Board
bleached sulphite	117,000	18,000
unbleached sulphite	555,000	25,000
aliphatic	212,000	38,000
mechanical	703,000	47,000
notter.	3,000	17,000
esparto.	130,000	..

waste paper.	10,000	290,000
loading, etc.	220,000	15,000
	2,000,000	450,000

raw materials is concerned. It is difficult to estimate the effect of European war conditions, since some mills were turned over to munitions manufacture. There was probably a considerable decrease in 1940 in paper imports to offset this temporary decrease in production.

The total paper and board produced in 1939 was 2,306,452 long tons.

The total consumed was 3,200,000 tons. (R. G. M.)

Papua: see BRITISH EMPIRE; PACIFIC ISLANDS, BRITISH.

Paraguay, an inland republic in southern South America; language, Spanish; capital, Asunción; provisional president, General Higinio Morínigo. The area is 154,165 sq.mi. The population (1936 census: 936,126) was officially estimated at 1,484,848 on Dec. 31, 1938. The chief cities are: Asunción, 104,000 (est.); Villarrica, 20,000 (est.); Concepción, 11,000 (est.); Encarnación, 10,000 (est.); Paraguari, 10,000 (est.).

History.—The year 1940 was one of economic and political difficulties for Paraguay. By Jan. 1940, the "honeymoon period" which had followed the accession of President General José Félix Estigarribia in Aug. 1939 had spent its course. Bitter interfactional political dissensions and excessive agitation by university students

culminated in a cabinet crisis in mid-February. On Feb. 18, President Estigarribia proclaimed a political truce and assumed dictatorial powers as the only alternative to political anarchy, pending the drafting of a new constitution to replace that of 1870. Estigar-

ribia, who was generally regarded as a vigorous and capable statesman devoid of personal ambition, was able to maintain a strong government and to enhance its prestige among the American republics. Construction of public works, notably the Asunción-Villarrica highway, was pushed, as technical experts from the United States studied possibilities of economic reform and expansion. At the Havana conference in July, Foreign Minister Salomoni gave staunch support to the move for western hemisphere solidarity (see HISPANIC AMERICA AND THE EUROPEAN WAR). Meanwhile, a special committee of law professors drafted a new constitution, which was completed in July. The document followed the general lines of its predecessor, but reflected the president's own social consciousness. Submitted to a national plebiscite on Aug. 4, it was given overwhelming popular approval. President Estigarribia thereupon announced new presidential elections to be held in November. The death of President Estigarribia in an aeroplane crash on Sept. 7 threw the entire country into confusion. The cabinet selected General Higinio Morínigo, minister of war, as provisional president until the new elections could be held, but the new president, reputedly under strong army influences, soon postponed the election until 1943. Various Estigarribia reforms were discarded or shelved, and over the ensuing three months all members of the Estigarribia cabinet gave up their posts as political friction grew.

Education.—Paraguay has over 1,800 schools, with enrolment of over 150,000. The National University of Paraguay is at Asunción.

Finance.—The monetary units are the paper and gold pesos, both based on Argentine currency (values: approximately $\frac{1}{3}$ cent and 68 cents U.S.).

Trade and Communication.—External communication is primarily by way of the Paraná river, where regular, frequent steamer service is maintained; by railway to Argentina; and Pan American Airways to Argentina and Brazil. There are 1,147 km. of railways. The highway system is in process of development. Efforts to break Argentine control over the country's trade outlets have been manifested in plans for highway and railway connections with the south Brazilian coast. The 220-km. Marshal Estigarribia highway between Asunción and Villarrica, now under construction by a North American corporation and financed through credits granted by the United States Export and Import bank in 1939, it is intended, will ultimately be extended to the Brazilian border. Completion is planned for 1942 or early 1943.

Imports (chiefly foodstuffs, textiles and machinery) totalled 12,603,834 gold pesos in 1939. Nearly 40% came from Argentina, the balance largely from Germany, Great Britain and the United States. Exports were 13,163,516 gold pesos, and comprised quebracho extract, canned meat, hides, yerba maté, meat extract and cotton. In the first nine months of 1940 imports increased sharply, but the problem of marketing export commodities formerly taken by war-involved countries of continental Europe became increasingly difficult.

Resources.—Paraguay's resources are agricultural, pastoral and forestal. Cotton, maté (Paraguay tea), tobacco, sugar and citrus fruits are the leading agricultural commodities. Cattle are the principal livestock. Quebracho and its extract (tannin) are the

most important forest products. Manufacturing is on a small scale and for domestic consumption, except for processed meats and some fine lace work for export.

Defence.—In 1939 Paraguay's defence forces included an army of some 10,000 men, and a navy of two gunboats. (L. W. BE.)

Parapsychology: see PSYCHICAL RESEARCH.

Parents and Teachers, National Congress of.

The National Congress of Parents and Teachers, represented locally by parent-teacher associations, was established in Washington, D.C., Feb. 17, 1897, as the National Congress of Mothers. The membership, however, for many years has included fathers, teachers and other citizens. On April 15, 1940, there were 2,379,599 active members enrolled in 28,000 associations in the 48 states, the District of Columbia, Hawaii, Alaska and Puerto Rico.

Congress parent-teacher associations have for their purpose the education and welfare of children and youth. Activities vary with the type of school with which the parent-teacher associations are connected, the educational system under which the school operates, the customs of the members of the group and the social and economic life of the community. The activities relate to art, character and spiritual education, health and summer round-up of the children, citizenship, the exceptional child, education for home and family life, international relations, juvenile protection, legislation, mental hygiene, motion pictures and visual education, music, parent education, radio, reading and library service, recreation, rural service, safety, school education, social hygiene, and study of the effects of alcohol and narcotics. The program of action for 1940-43 has for its basis the theme, "The Child in His Community."

The *National Parent-Teacher* is the official parent-teacher magazine, issued ten times a year. The *National Congress Bulletin* is sent monthly from September to June to every local association. Among the many publications are the annual convention *Proceedings* and *Schools for Democracy*. The office of the National Congress is at 600 South Michigan boulevard, Chicago, Ill.

Paris. Paris, capital of France (population 2,829,746; of Greater Paris, including neighbouring suburban area, 4,933,855), is both the administrative and cultural centre of France and an important industrial region, as the residential part of the city is surrounded by a belt of predominantly industrial suburbs. For the first time since the Franco-Prussian War of 1870-71, Paris in 1940 experienced a hostile occupation when the German forces entered the city early on the morning of June 14. It was the ninth recorded invasion of Paris. The capital previously had been declared an open city and was surrendered without fighting, following the collapse of the French effort to hold the river lines of the Somme and the Marne during the previous week.

There was an enormous flight of the population from Paris in trains, automobiles, trucks, peasant carts, on bicycles and on foot during the last days before the fall of the city and it was estimated that only about one-third of the population remained when the Germans entered. After the signing of the armistice there was a steady filtering back of residents to the city. It was reckoned that the population at the end of August was 1,300,000 below the normal figure. Jean Chiappe, former conservative prefect of the police, was appointed civil governor of the city after the German occupation; final decisions rested in the hands of the German military authorities. Chiappe was subse-

quently transferred to the post of high commissioner for Syria and was killed in an aeroplane accident in the Mediterranean.

German soldiers were not much in evidence in Paris after the occupation, being mostly quartered outside the capital. Groups of soldiers were taken in buses and trucks on sightseeing trips to the city's many places of historical and artistic interest. The city suffered considerable physical deprivations as a result of the foreign occupation and the blockade. Rations in occupied France at the end of October were reported to be $\frac{3}{4}$ lb. of meat, $5\frac{1}{2}$ lb. of bread, $3\frac{1}{2}$ oz. of butter and $1\frac{3}{4}$ oz. of cheese per week, and there was a good deal of standing in line for provisions. There was also a shortage of fuel. On Sept. 9, 1940, the president of the Union of Mayors of the Seine district stated that there were 300,000 unemployed in the region of Paris.

The discipline of the German troops, according to general testimony, was good and no cases of disorderly pillage were reported, although there was some confiscation of goods in Jewish shops. There were occasional minor incidents, as when the German military authorities threatened to close the moving picture theatres unless applause at bombing of German towns by the British air force ceased and when student demonstrations occurred on Armistice day, with the result that the police intervened and four demonstrators were injured. As a reprisal there was a temporary closing of the higher schools. The opera and theatre resumed

GERMAN CAVALRY entering Paris June 14, 1940 skirted the Arc de Triomphe, under which the tomb of the unknown soldier of 1914-18 lies

ir functions and some newspapers recommenced publication in is. Motor transportation almost completely ceased, except for rman military cars and buses, because of the acute shortage of oline; and the "Metro" or subway became the chief means of nsportation in the city.

During the first months of the year, before the German inva- in May and June, Paris led an easy life, for a wartime capital. few rationing restrictions, designed to limit consumption of at, pastry and alcoholic drinks, were imposed; but there was serious shortage of any foodstuffs or commodities. During winter and early spring, when the war was a matter of minor mishes and patrol activities, many of the women and chil- n who had been evacuated from Paris in the first days of the r returned to their homes. The black-out was very mildly en- ced in Paris, by comparison with London and Berlin. "Abris" shelters were provided in the more stoutly built cellars the city and in some subway stations, and people were sup- ed to take refuge there on the sounding of the air-raid alarms, which there were a fair number. The only air attack on the y, however, occurred on June 3 when some 200 German aéro- nes dropped about 1,000 explosive and incendiary bombs on is and its environs, killing 254 persons and wounding 652. e objectives of this German raid were primarily industrial nts and more damage was inflicted on the suburbs of the city n on Paris itself.

The terms of the armistice contemplated a possible return of French government to Paris before the end of the war; and is subject was in 1940 under discussion between the Vichy gov- ernment and the German authorities. Marshal Pétain was espe- cially anxious to transfer the seat of government to Paris, which he historic capital of the country. Negotiations on this ques- tion advanced far enough in 1940 to permit some preparation of sailles as the seat of the French government, which would ap- parently enjoy an extraterritorial status in the German-occupied a, with some kind of facilities for unobstructed communica- n with the unoccupied provinces. No definite decision had been en, however, by the end of the year. (W. H. CH.)

Parks and Monuments: see NATIONAL PARKS AND MONU- MENTS.

Parliament, Houses of. The 1940 session of the British parliament was opened by the king on Nov. 28, 1939, and was prorogued on Nov. 21, 1940.

House of Commons.—There was the unprecedented number of by-elections during the eleven months Jan.-Nov. 1940, with e others pending and one or two other constituencies virtu- ally unrepresented, the members having been reported as "mis- sionaries" or prisoners of war; over 100 members were with the armed ces.

No change in the representation of parties occurred; but the rty truce was ignored on 13 occasions, on 8 of which the com- munist, fascist or "anti-war" candidate forfeited his deposit of 50 by failing to secure one-eighth of the total poll. The return the house of Sir Edward Cadogan, a member of the India atutory commission 1927-30, and the accession to it of the me minister's son, Randolph Churchill, should be recorded.

Holidays were short, and, though the house of commons as a e met three times a week only, the various committees were ly occupied. Winston Churchill succeeded Neville Chamberlain prime minister on May 10, and on May 18 announced that he ould lead the house as far as his duties would permit and that e lord privy seal, C. R. Attlee, would act as deputy leader; a v days later he stated that as no alternative party capable of rming a government existed, the salary of the leader of the oppo-

sition would be held in abeyance. Secret sessions of both houses were held from time to time to discuss matters arising out of the war, and on Oct. 24 a bill prolonging the life of this parlia- ment for a year from Nov. 25—when it would normally lapse— was passed. A move was also made toward the setting up of a speaker's conference to consider proposals for electoral reform.

Suggestions for the broadcasting of the prime minister's speeches from the house and for the issue of *Hansard* in a cheap and, perhaps, condensed form were not favourably received; but with regard to the latter, permission was later obtained by a publisher to issue abbreviated, though verbatim, versions of the parliamentary debates, and two volumes dealing with the period from Aug. 24, 1939, appeared at 6d. each.

A question of privilege arose through the detention in May of Captain Ramsay (member for Peebles) under Defence Regulation 18B, which gives the home secretary this power if he has reason- able cause to believe any person to be of hostile associations or recently concerned in acts prejudicial to public safety. Captain Ramsay's appeal, on the ground of privilege, was dismissed in November, it being found that his detention was not due to any- thing he had said in parliament. Another matter affecting mem- bers was the appointment in October of a select committee of all political parties to inquire into the conduct of Mr. Boothby (Aberdeen, E.), parliamentary secretary to the minister of food, in connection with the payment from assets in Great Britain of claims against the government of and institutions in Czecho- slovakia. Mr. Boothby had been active as chairman of a com- mittee dealing with this matter and, said Mr. Churchill, appeared to have had a financial interest in one large claim.

House of Lords.—The composition of the house of lords re- mained practically unchanged; six baronies and one viscountcy became extinct during the session, and seven baronies and two vis- countcies were created, one of the new viscounts (Hewart) having formerly sat as a baron. Lord Caldecote, the then secretary for the dominions, became leader of the house on the change of gov- ernment in May and, on becoming lord chief justice on Oct. 3, was succeeded by Lord Halifax, secretary for foreign affairs. Lord Addison was in 1940 leader of the Labour peers. (L. H. D.)

Pasternack, Josef Alexander (1880-1940), Polish- American orchestra con- ductor, was born in Czystochowa, Poland, the son of the con- ductor of the town band. He began to play the violin at the age of four and at ten he was sent to the Warsaw conservatory of music, where he learned to play every musical instrument except the harp. He went to the United States on a concert tour when a young man and remained as solo viola player in the orchestra of the Metropolitan Opera company of New York. At the sugges- tion of Toscanini he became a conductor, and through the influ- ence of Karl Muck he was engaged as conductor of the Bremen orchestra. He was called back to the United States to conduct the orchestra of the Metropolitan Opera company. For five years he also conducted the Philadelphia Philharmonic orchestra. In 1916 he became the musical director of the Victor Talking Machine company. In later years he conducted radio programs. He died in Chicago, April 29.

Patents. The year 1940 marked the sesquicentennial of the signing of the first United States patent law by President George Washington on April 10, 1790. President Roose- velt by proclamation designated April 10, 1940, as "Inventors and Patent day" to commemorate an event which, he declared, "had proved so important and salutary to this nation." By joint reso- lution of both houses of congress, a commission to mark the an- niversary by appropriate exercises was authorized and private

organizations also participated in the celebration.

Several of the acts of congress respecting patents which were enacted in 1939 came into force in 1940. Most important of these is the act reducing from two years to one year the period of publication and public use which bars the grant of a patent. In most foreign countries the publication or use of an invention at any time prior to applying for a patent will bar the grant of a valid patent.

Another act of congress, effective on June 30, 1940, transferred from the patent office to the register of copyrights in the Library of Congress, jurisdiction over the registration of copyrights for prints and labels used for articles of merchandise. In 1874 congress assigned to the patent office the function of registering such copyrights, although all other copyrights were registered in the Library of Congress.

A measure approved July 2, 1940, amended the Tariff act to provide that the importation of products made by processes covered by U.S. patents may be stopped under certain circumstances.

As a part of the program of national defence congress provided, on July 1, 1940, that the commissioner of patents could order held in secrecy inventions relating to the public safety and defence and withhold the granting of a patent when the publication or disclosure of the invention might be considered detrimental.

Among the effects of the war in Europe was a decline in the number of applications received from the belligerent and other countries.

Applications filed were 61,425 in 1940, as against 66,166 in the preceding year. Patents granted, including those covering reissues, designs and plans, numbered 47,924, exceeding by 451 the total issued in 1939. Registrations of trade marks, including petitions for renewals, were 14,843, an increase of 524 compared with 1939. Earnings represented by initial fees paid by applicants were \$1,838,730 in 1940. This was \$141,840 below the total for 1939. Receipts from all sources in 1940 were \$4,563,916.32, or \$99,623.10 less than expenditures. This was the second deficit since 1933. During that period, however, the surpluses averaged \$102,100.70.

(C. P. Co.)

Patrick, Mary Mills (1850–1940), U.S. educator, founder and president emerita of the Istanbul Woman's college in Turkey, was born in Canterbury, N.H., March 10. She was educated at Lyons college in Iowa and at Heidelberg, Zürich, Leipzig and Berne. In 1871 she was appointed as a teacher in the American school in Erzerum, Armenia. Then, after teaching a while at the Home school at Scutari, she became its head in 1883. Through her efforts it received a charter as the American College for Girls in Constantinople and in 1894 its value was recognized by the Turkish authorities and its permanence was assured. She received the degree of doctor of laws from Smith college and was decorated by the sultan of Turkey and the king of Bulgaria. She retired in 1924, returned to the United States and died in Palo Alto, Calif., Feb. 25.

Peaches. The United States peach crop in 1940 was estimated in October by the department of agriculture as 52,516,000 bu. The 1939 crop was 60,822,000 bu. and the ten-year average (1929–38) was 52,713,000 bu. California clingstone production in 1940 was estimated at 14,084,000 bu., compared with

15,251,000 bu. in 1939; freestones 8,251,000 bu. in 1940 and 8,792,000 bu. in 1939. The table shows estimated production, all varieties, by states in 1940 and 1939.

(S. O. R.)

Peanuts. A record high acreage in principal peanut-growing states and favourable growing weather raised the 1940 peanut crop in the United States 30% above 1939. October estimates by the department of agriculture placed peanut production for picking and threshing in 1940 at 1,539,540,000 lb., a

against 1,179,505,000 lb. in 1939 and a ten-year (1929–38) average of 1,035,243,000 lb. Yield per acre in 1940 was 787.5 lb. compared to 634.5 lb. in 1939 and a ten-year average of 721.4 lb. (S. O. R.)

Pearl, Raymond (1879–1940), U.S. biologist, was born in Farmington, N.H., June 3, and died in Hershey, Pa., Nov. 17. For a biographical sketch see *Encyclopædia Britannica*, vol. 17, p. 420.

Pears. The 1940 pear crop in the United States was estimated in October by the department of agriculture as 32,114,000 bu., all varieties. This is 3.4% larger than the 1939 crop of 31,407,000 bu. and 22% above the ten-year (1929–38) average of 26,333,000 bu. Total production of Bartlett pears in California

Washington and Oregon in 1940 was 14,096,000 bu., other varieties 6,604,000 bu., compared to 14,529,000 bu. Bartlett and 6,021,000 bu. of other varieties in 1939. In New York, Bartlett and Clapp's Favorite produced heavier yields than in 1939, while Bosc and Kieffers were about the same as in 1939, with Seckel pears in a lighter 1940 crop. The table shows the estimated production of pears by states in 1940 and 1939.

(S. O. R.)

Pecans: see NUTS.

Peixotto, Ernest Clifford (1869–1940), U.S. artist, was born in San Francisco, Oct. 15, and received his art education in Paris under Benjamin Constant and Jules Lefebvre. He won a reputation as a mural painter and in 1911 was commissioned to paint the story of "Le Mort d'Arthur" for the public library in Cleveland, Ohio. The successful accomplishment of the task led to commissions to decorate the walls of public rooms in New York city and Paris. In 1918 he went to France as official artist with the American expeditionary force. The next year he became director of the

partment of mural painting in the Beaux Arts Institute of Design in New York city, holding the post until 1926 when he resigned to devote his time to painting and writing. He was an officer of the French Legion of Honour and president of the International Society of Mural Painters. He died in New York city, Dec. 6.

Pellagra. Striking advances in the therapy for dietary deficiency diseases were made in 1940. What had once gone under the name of pellagra is now known as a mixture of diseases, though to persons in the endemic areas pellagra still connotes a picture of prolonged agony, years of ill health and lingering death, often associated with confusion or insanity.

The mortality rate for severe pellagra a few years ago was over 50%, but thousands of consecutive cases have been treated without a death.

Case studies of persons with dietary deficiency diseases, analysis of their diets and controlled observations on the response of these people to synthetic chemical substances, such as nicotinic acid, thiamin, riboflavin, pyridoxine and ascorbic acid, etc., indicate that deficiency diseases are mixed in nature and occur simultaneously; that is to say, if one has pellagra, he may well be expected to have "a touch of" thiamin deficiency and riboflavin deficiency.

Persons committed to custodial institutions for the insane because of pellagrous psychoses have been restored to normal mental health by the administration of adequate amounts of nicotinic acid or substances that act similarly.

It has been shown that what was termed the "initial nervous syndrome of pellagra," characterized by apprehension, irritability, disorders of heart action and digestion, tremors, shuddering, imaginary fears, such as of snakes, fire or death, can be relieved by thiamin.

Many of these people who had disintegration of personality and a breakdown in morale have been restored to good health; some have returned to hard work and others have been accepted by the army and navy.

A new dietary deficiency disease in children has been discovered which prevents them from developing properly in weight and height, retards their progress in school and causes eye disease and soreness at the corners of the mouth. When such symptoms arise from the lack of riboflavin in the diet, they are relieved by the administration of riboflavin or substances rich in it.

From a practical point of view, it is important to realize that when specific therapeutic agents are administered in the treatment of deficiency diseases to persons of any age, they should also be given a well balanced high caloric diet. (See also **DISEASES**; **VITAMINS**.)

Umba: see **BRITISH EAST AFRICA**.

Pennsylvania, one of the original 13 states of the United States, popularly known as the "Keystone State," area 45,126 sq.mi. (239 sq.mi. water); population (U.S. census, 1940) 9,900,180. Capital, Harrisburg, 83,893.

Cities with a larger population (census of 1940) were Philadelphia, 1,931,334; Pittsburgh, 671,659; Scranton, 140,404; Erie, 116,955; Reading, 110,568; Allentown, 96,904; Wilkes-Barre, 86,236. There were gains in population in 56 of the 67 counties, and in the cities of Harrisburg, Erie and Allentown.

History.—The Democrats carried the state in the election on Nov. 5, giving to President Roosevelt its 36 electoral votes. Roosevelt received 2,171,035 votes in the balloting and Willkie 1,889,848. Joseph F. Guffey was re-elected to the United States senate and 19 Democrats were elected to the national house of representatives, a gain of four since 1928. The Republicans elected 15. The Democrats elected G. Harold Wagner as state treasurer and F. Clair Ross as auditor general. The Republicans retained control of the state senate with 32 members to 18 Democrats, but the Democrats elected 126 members of the house of representatives to 82 by the Republicans, giving the Democrats control of that body. The question whether motion picture theatres should be operated on Sunday was submitted to the voters and 87 communities voted against Sunday opening; 47 in which the theatres had been closed voted to permit their operation; 12 which five years ago had voted for Sunday opening favoured its continuance and six in which the theatres had been open voted to close them this year.

The general assembly, at the call of the governor, met in special session on May 6, primarily to appropriate \$71,850,000 for unemployment relief. The money was voted. Among other measures approved were one authorizing the extension of the Harrisburg-Pittsburgh superhighway from Carlisle to Philadelphia; another appropriating \$1,000,000 for the relief of distressed school districts; an increase from 16 to 18 years in the age limit for those eligible for aid as dependent children; an amendment to the election code permitting a special election for filling vacancies in the general assembly during a recess, and one exempting employers from the payment of insurance taxes on salaries in excess of \$3,000. The head of the new department of commerce reported early in 1940 that \$194,846,109 had been spent for new industrial plant construction and equipment in 1939. The dispute over the constitutionality of the Fair Sales act of 1937 reached the state supreme court in May. That court decided that the act was invalid as its second section, which forbids the sale of merchandise at less than cost by any retailer or wholesaler, violated the 14th amendment of the United States constitution. The court pointed out that the Pennsylvania act differed from similar acts in other states as it absolutely forbade the sale of any article below cost, whereas the acts of other states forbade such sale only when made for the purpose of injuring competitors or creating a monopoly. In January the governor appointed an anthracite emergency committee to attempt to solve the problems of the mining industry. The committee is made up of three state officers and representatives of the United Mine Workers and the companies which operate the mines. It agreed on a voluntary stabilizing program under which the amount of anthracite to be mined by each operator would be allocated from week to week. David L. Lawrence, former secretary of the commonwealth, who was indicted in 1939 for conspiracy, blackmail and violation of the election laws, was brought to trial and acquitted. The governor called on the people of the state to observe Nov. 28 as Thanksgiving day.

The principal officers were: governor, Arthur H. James; lieutenant governor, Samuel S. Lewis; attorney-general, Claude F. Reno; treasurer, F. Clair Ross, until May 31, 1941, when he will be succeeded by G. Harold Wagner; superintendent of public instruction, Francis B. Haas; chief justice, William I. Schaffer.

Education.—The school system of the state is under the direction of the department of public instruction. It has carried out

successfully its plan to reduce the number of one-room school houses by the consolidation of schools. The department examines and licenses applicants for permission to practise various professions, including architects, anthracite and bituminous mine inspectors, dentists, engineers, nurses, opticians, physicians, pharmacists and public accountants. The state appropriates each year large sums for the relief of rural schools. It also appropriates money to the University of Pennsylvania, the University of Pittsburgh, Temple university, Jefferson and Hahnemann Medical colleges and the Woman's Medical college.

Banking and Finance.—On June 30, 1940, there were 402 financial institutions under the supervision of the department of banking, exclusive of 143 national banks with trust departments. The total resources of the state institutions on that date were \$3,181,680,536.30. The capital of the 402 banks was \$112,853,477.72 in common stock and \$19,124,369.67 in preferred stock. There were 3,794,273 depositors. The state institutions administered trust funds on March 4, 1940 amounting to \$4,596,618,258.41.

On June 29, 1940 there were 690 national banks with a total capital of \$165,433,000, deposits of \$3,142,952,000 and assets of \$3,608,471,000.

Agriculture, Manufactures, Mineral Production.—According to the latest agricultural statistics there were in the state 191,284 farms with a total acreage of 15,855,343. The value of the land and buildings was \$861,706,599. The value of the livestock on Jan. 1, 1940 was \$140,587,000. The value of the field crops for 1939 was \$140,450,000 and the cash income from livestock and livestock products was \$189,169,000. The latest industrial statistics show that there were in the state 17,287 establishments with an invested capital of \$4,283,239,700, employing 1,096,646 persons to whom \$1,125,630,000 was paid in wages. In addition there were 156,460 persons on salary, including officers and office employees to whom \$354,271,500 was paid. The value of the output was \$4,342,495,200.

The metal and mineral products were valued at \$3,058,279,700; food and kindred products, \$770,319,200; mine and quarry products, \$446,197,300; textiles, \$819,402,500; paper and printing industries, \$340,436,600; tobacco and its products, \$35,513,300.

Highways.—On May 31, 1940, there were 95,321 mi. of highways, 40,521 mi. of which were classed as state and rural roads. There were 32,142 mi. of roads improved with concrete, macadam or brick surface and 8,379 mi. of unimproved roads. The receipts of the road fund for the year ending May 31, 1940, were from the gasoline tax, \$35,636,693.07; from motor vehicle registration, \$30,352,938.04; from operators' licences, \$3,299,879.50, and from federal aid, \$7,149,078.67. During the year the highway department spent from this fund \$53,102,272.67. On Oct. 1, 1940 the Pittsburgh-Harrisburg super-highway was opened. (See ROADS AND HIGHWAYS.)

Pennsylvania, University of, opened its 1940-41 session with an enrolment of approximately 15,447 and a faculty of approximately 1,620. Dr. William E. Lingelbach, professor of modern European history, became dean of the college, vice Dr. Paul H. Musser, who had become administrative vice-president.

Dr. Herbert F. Goodrich, vice-president in charge of the law school, dean of the law school and professor of law, resigned to accept appointment by the president of the United States as judge of the third circuit court. Dr. Edwin R. Keedy, professor of law, became acting dean of the law school. John B. Thayer, trustee of the university and director of the bicentennial celebration, became treasurer of the university, vice F. Corlies Morgan, deceased.

During the year 1940, the university celebrated its bicentennial. Representatives of 416 universities, colleges and learned societies throughout the world attended this celebration. Scholars from the United States and foreign nations participated in 78 addresses and symposia in the fine arts, humanities, medical sciences, natural sciences, religion and social sciences, held at the university and attended by 25,700 persons. At a convocation held Sept. 20, 1940, honorary degrees were conferred upon the president of the United States and the chief justice of Canada, who made responses.

There was continued activity in research throughout the university, particularly in medical research. (T. S. G.)

Perkins, James Handasyd (1876-1940), U.S. banker, was born in Milton, Mass., Jan. 11, and was graduated from Harvard university in 1898. From 1905 to 1914 he was in the banking business in Boston, Mass. and Albany, N.Y. In the latter year he became vice-president of the National City bank in New York city. He was president of the Farmers Loan & Trust company for eight years; in 1929 he became chairman of the City Bank Farmers Trust company, and in 1933 chairman of the board of the National City bank. He was commissioner of the American Red Cross in Europe from 1917 to Sept. 1918, when he resigned to enlist in the American expeditionary force. He received the U.S. Distinguished Service medal and was made an officer of the French Legion of Honour and a commander of the Order of the Crown of Belgium. He died in Mount Kisco, N.Y., July 12.

Permanent Court of International Justice.

The Permanent Court of International Justice became moribund after the invasion of the Netherlands on May 10, 1940. The court held only one session during the year, from Feb. 19 to Feb. 26. In that time it ordered the oral argument in the case of the Electricity Company of Sofia (Belgium) v. Bulgaria. The Bulgarian government sought an extension of time because its counsel, Professor Gidel, had been mobilized in the French army. The court considered this not a case of *force majeure* and ordered the oral argument to begin May 16. Because of the war the oral argument did not take place, for the court did not convene after February.

An extension of time was granted for the submission of memorials in the Gerliczy case brought by the Principality of Liechtenstein against Hungary. The memorial was to be filed June 15, 1940, but this was not done.

During 1940, Great Britain, following the practice of several countries during 1939, gave notice of the termination of its acceptance of the court's obligatory jurisdiction under article 36 of the statute. Other countries had given notice that their acceptance was not to be operative with respect to disputes arising out of the war. On the other hand, some of the signatory governments were of the opinion that such reservations to a previous acceptance could not be made, and entered caveats or reservations of their own against the notice. The matter of obligatory jurisdiction was therefore in some confusion, which would probably not be settled unless the court was re-established and a case actually

se involving the issue. Perhaps it should be noted that in Feb. 1940 the Greek government accepted the court's obligatory jurisdiction for a period of five years commencing Sept. 1939.

Persia: see IRAN.

Peru, a republic on the west coast of South America; language, Spanish; capital, Lima; president, Dr. Manuel Prado y Arateche. The area, including some 100,000 sq.mi. of territory shared with Ecuador, is officially estimated at 532,185 sq.mi. During 1940 the first census since 1876 was taken, but no results were published by the close of the year. Meanwhile, unofficial population estimates ranged from 6,600,000 to as high as 10,000,000. The chief cities are: Lima, 650,000; Callao, the port of Callao, 120,000; Arequipa, 100,000; Cuzco, 80,000; Trujillo, 60,000; Chiclayo, 50,000; Iquitos, 40,000.

History.—During 1940 Peru underwent a notable political readjustment as President Prado, who had succeeded Dictator-President Oscar Benavides in Dec. 1939, gradually relaxed the restraints of the Benavides dictatorship and moved toward a general restoration of civil liberties. Benavides himself was eliminated from the political scene with appointment as Peruvian ambassador to Spain.

On May 24, the most disastrous earthquake in over half a century shook Lima and Callao, costing over 300 lives and doing heavy property damage. Subsequently, the government announced plans for "quakeproof" houses to replace those which had been destroyed.

Internationally, Peru moved generally in accord with the United States, and supported that country in its hemisphere defence proposals at the Havana conference. United States efforts to obtain equal base rights on the north Peruvian coast failed, however. Several popular manifestations of anti-totalitarian feeling occurred in 1940, partly as a result of German pressure to ban showing of anti-Nazi films. The Italian Caproni aircraft factory was taken over by the government and an Italian military mission was replaced by one from the United States.

Education.—Peru had in 1940 more than 5,900 elementary schools, with some 700,000 pupils, more than 216 secondary schools and several technical schools.

Finance.—The monetary unit is the sol, valued at approximately 15½ cents U.S. (Dec. 1940), against a 1939 average of 16 cents.

Communication.—Peru has good maritime and excellent air communication with foreign countries, supplemented by a railway connection with Bolivia. Air transport service links various parts of the country. There were in 1940 more than 2,600 mi. of railway, including the Central Railway of Peru, which reached the highest elevation of any standard gauge railroad in the world (14,806 ft.). As a result of the national road plan of 1937, which was substantially completed in 1939 at a cost of 80,636,000 soles, the Peruvian highway system embraced 16,361 mi. of which 13,293 mi. was unimproved earth and 2,315 mi. improved pavement. The most important developments were the Peruvian section of the Pan-American highway, 1,895 mi. long, with 783 mi. completed, and the 190-mi. Central highway from Lima to La Oroya in the Amazon basin, which attains an altitude of 16,127 ft. Due to highway improvement, gasoline consumption in 1939 was 12½% more than in 1938 and 22½% more than in 1937.

Foreign Trade.—Peru's imports are mainly machinery and automobiles, textiles, metals and foodstuffs. The leading exports are petroleum and its derivatives (33.9% in 1939), cotton (19.7%), sugar (17.7%) and sugar (10.8%). In 1939 imports were 255,736 soles (260,158,735 in 1938), chiefly from the United States, 41.1% (1938: 34.3%); Germany, 14.7% (1938: 20.3%);

Great Britain, 8.4% (1938: 10.1%); and Argentina, 5.4% (1938: 6.1%). Exports were 381,421,389 soles (342,128,640 in 1938), largely to the United States, 30.4% (1938: 26.8%); Great Britain, 19.6% (1938: 20%); Chile, 7.8% (1938: 6%); Germany, 6% (1938: 10.6%); Argentina, 5.8% (1938: 7.8%); France, 5.6% (1938: 6.4%); and Brazil, 4.8% (1938: 1.9%). In the first seven months of 1940, exports rose 10% in value and imports, 33%.

Agriculture and Mining.—The chief agricultural products are cotton, sugar, rice, coffee, corn, coca and vegetable ivory. In 1939, 272,179 tons of sugar and 77,203 tons of cotton were exported. In 1939 petroleum production declined for the fourth consecutive year. Production in 1940 was estimated at 12,451,300 bbl. The principal fields are in the north, but fields were opened in the Amazon basin during 1939. Peru leads the world in vanadium and bismuth production. Copper (34,061 tons exported in 1939), silver, gold, tungsten, lead, antimony, zinc and other minerals are extensively mined. (L. W. BE.)

Pests, Agricultural: see ENTOMOLOGY.

Pétain, Henri Philippe (1856–), French soldier and statesman. See *Encyclopædia Britannica*, vol. 17, pp. 639–40 for his biography. The venerable marshal was called from virtual retirement in 1939 to become French ambassador to Spain after Franco's triumph in the civil war. He remained in this post after the beginning of war in 1939 until May 18, 1940 when, with France's army falling back in a retreat approaching a rout, he was summoned to Paris to act as vice-president of the government council and adviser to the minister of war. On June 16 he succeeded Paul Reynaud as premier, and the next day he was forced to sue for an honourable peace. With an energy that belied his 84 years he then began the painful task of reconstruction under the watchful eye of France's conquerors. Moving his government to Vichy July 2, he secured from the national assembly authorization to prepare a new constitution. This task he allotted to Pierre Laval, whom he named as his successor July 12 (but dropped from the cabinet Dec. 13 "for high reasons of internal policy"). On July 10 Pétain assumed dictatorial powers until such time as the new constitution was ratified. He had to face not only internal unrest but the external pressures of axis domination, Japanese aggressions in Indo-China, and the "Free French" movement of de Gaulle. His meeting with Hitler at Montoire Oct. 24 gave promise of a *modus vivendi* with Germany, but this promise was short-lived and was ruptured by the expulsion of Frenchmen from Lorraine in November—an act which Pétain vigorously protested.

Petrol: see GASOLINE; PETROLEUM.

Petroleum. With the war in Europe well advanced into its second year, the matter of oil supply for mechanized land, sea and air armaments and for the industrial front behind the lines was one of increasing concern to all belligerents in 1940. With blockades in force which cut off or reduced usual supplies going to many non-belligerent as well as belligerent countries, radical changes in what was once the normal movement of the world's oil were necessary.

With the United States, producing more than 60% of the world's petroleum, launched on a huge national defence program which, as it progressed, would create a new great oil demand for mechanized defence forces, further drastic adjustment was anticipated for 1941.

Up to the close of 1940, none of the major belligerents lacked oil for carrying on the war.

Since the war started, in 1939, Germany acquired either by military conquest or by diplomatic force, control of the oil-producing fields of Czechoslovakia, France, Poland and Rumania, whose annual production runs around 54,000,000 bbl. Added to this were about 4,500,000 bbl. produced in Germany and Austria. Out of the roughly 60,000,000 bbl. annually thus controlled, more than 48,000,000 bbl. were accounted for by Rumania. So far as petroleum production is concerned, these 60,000,000 bbl. were all that were available in 1940 to both Germany and Italy, because of the effectiveness of the British blockade. Russia's production of over 200,000,000 bbl. annually could not be said to be available in any quantity to the axis countries because of huge domestic requirements and transportation difficulties.

As compared with petroleum sources of 60,000,000 bbl. annually under control of Germany and Italy, Britain by controlling the seas could draw on oil-producing countries in Asia alone with an annual production of close to 200,000,000 bbl.; on South America with an annual production of 245,000,000 bbl.; on Canada, Mexico and Trinidad with a combined annual production of about 60,000,000 bbl. This did not include the tremendous production of the United States which runs over 1,200,000,000 bbl. annually.

The overwhelming advantage to Britain apparent in this comparison existed in fact in her ability to run oil through the German blockade of the British Isles and to guard against incursion of these available sources by axis powers through military or diplomatic pressure. For instance, Japan, the Asiatic member of the axis, had vital American oil sources banned to her and was exerting extreme pressure on Netherlands India for increased supplies. Any extension of Japan's aggression southward would carry the threat of permanent or temporary loss of control or availability by Britain of Netherlands India's annual production of close to 60,000,000 bbl. and of Sarawak's and Brunei's annual production of over 7,000,000 bbl.

But there was another factor in addition to those mentioned, which reduced Britain's apparent advantage. When Germany entered the war she had developed and was building tremendous plants for making gasoline from coal and lignite by synthetic processes such as hydrogenation. Much of the output of these plants had been hoarded for several years to build up large reserves. In 1938 her production of synthetic gasoline was unofficially estimated at 12,750,000 bbl., a fivefold increase over 1933. One 1940 estimate stated that Germany was producing about 100,000 bbl. of gasoline per year synthetically, which indicated that her gasoline troubles

could not be acute. However, there were technical considerations which somewhat changed the picture (see GASOLINE), besides the effectiveness of the R.A.F. bombing of Germany's hydrogenation plants.

The fall of France and the entrance of Italy into the war carried great threat to Britain's controlled or available oil sources in Iraq, Iran and Bahrein island, these places producing nearly 120,000,000 bbl. annually. Had Italy succeeded in its invasion of Greece in 1940 or made good the boast to clear the Mediterranean of the British fleet and to take the Suez canal, it might have unleashed a German offensive through the Balkans or resulted in a diplomatic bargain with Russia which might have meant the loss of these oil sources to Britain and the acquisition of them by the axis.

As it was, even before Italy entered the war, the large bulk of Britain's oil supplies that came from Iran and the Island of Bahrein and British India, as well as the East Indies, was diverted from transportation through the Suez canal and the Mediterranean and sent around the Cape of Good Hope. Britain's continued control of the Mediterranean made Iraq production available to her.

Up to the close of 1940, Britain could get all the oil needed from the above sources, by way of the Mediterranean, and continued to ship around the Cape. In addition, there was the small production in Egypt as well as the refineries on the Suez canal. Moreover, Britain's continued control of the Mediterranean precluded in 1940 the possibility of Russian oil going through that sea to the axis powers. It shut off Rumanian oil shipments through that sea. Italy, with only a negligible home oil production, with no home coal sources for building up a synthetic gasoline production and with the British blockade tightening on her shores, was and could only, in 1940, be fed by her axis partner from the Rumanian oil fields and by Danube and overland shipments.

It has been said that to an extent unparalleled in history, the war continuing through 1940 was one fought with petroleum and for petroleum. Every military and diplomatic move since the war's beginning proved this to be true. Supplying the modern military machine requires tremendous stores and supplies of gasoline, fuel oil and lubricating oil. Military consumption is voracious.

Offsetting this in part was the restriction of civilian and nonessential use of these products in all belligerent and occupied countries.

However, there is little doubt that despite Germany's hoarding of oil despite her large production of synthetic gasoline, despite her acquisition of stocks and supplies in invaded countries and her rationing of oil products, Germany in 1940 found it vitally urgent to go into Rumania and to militarize Rumania's oil fields. This move and her strict rationing of gasoline were evidence of the shortage of petroleum among the axis powers. Lubricating oil for industrial machinery was also an acute problem. Animal and vegetable oils were pressed into service, with frequently unsatisfactory results. Oil taken from German planes was reported in 1940 to have been used far beyond what is considered safe practice in Britain and the United States. Rumanian oil has a low lubricating content, and for that reason the question of obtaining suitable lubricants continued to remain an acute one for the axis. Russian lubricants were reported to be moving up the Danube to help meet this situation.

Britain's oil picture was much better than that of the axis powers, depending upon her ability to keep open the overseas shipping lanes, and to protect her refineries and oil storage plants from destruction by German bombs. America's policy of aid to Britain gave her opportunity not alone to draw upon the tremendous oil resources of the United States but upon American tanker facilities. Many American-built tankers went over to foreign charter.

Britain's position as to home refineries and crude oil sources when the war began in Sept. 1939 was relatively one of independence even from the United States. It was better than her position when she entered the war of 1914-18, when the Allies are said to have floated to victory on a wave of American oil.

IN 1940 the Centralia-Salem oil field of Illinois was the most active producing area in the U. S. Lack of quotas and conservation laws was responsible for placing Illinois third among the oil-producing states. At the left in the picture is a small refinery; in the background is a derrick lighted for night drilling

What the United States would be able to supply products of advanced technical development to Britain and still have an adequate supply to meet own increased needs for defence armaments may be illustrated by some comparisons of the American oil situation in 1940 and in 1917. The number of producing oil wells in the United States has nearly doubled. Wells are drilled five times as fast. Continuous exploration is opening up new fields and scientific advancement has given the means of restoring productivity of old fields. Much of American oil production is held back by rationing production; wells could be opened up to produce an immediate and greatly increased output.

The backlog of crude oil reserves for the future is estimated to have reached a figure of 18,500,000,000 bbl.—three times greater than that of 1917. American refineries operating and shut down had a capacity of 18,000 bbl. daily as of Jan. 1, 1940, or about four times the capacity of 1917. Stocks of essential products in 1940 were two to ten times as large as in 1917, and storage capacities correspondingly greater. Land transportation facilities were more than twice as extensive. Marine transportation equipment was eight times as large. Production of finished gasoline was 10 times as great and production of lubricating oils doubled.

In the defence program in the United States, petroleum played an increasingly important part. Whereas during the war of 1914-18, American exports of petroleum products went way up, since the beginning of the war in 1939, they declined because of blockades and lost civilian markets. By Jan. 1, 1941, buying of petroleum products resulting from the defence program was negligible, much less than enough to offset the loss of exports to the continent of Europe. However, the program for a great mechanized navy and for a two-ocean navy drawing heavily on petroleum fuels and lubricants created an unprecedented new consumption as it advanced.

The petroleum industry was in 1940 represented in the petroleum section, raw minerals division, of the advisory commission to the council on national defence and in the transportation division of the national resources board. Refinery technicians have long worked closely with army and navy officials in developing fuels, and a survey was under way in 1940 to study the problems of better protection of oil storage against possible air attack.

The American defence program might find petroleum overcoming bottlenecks in fields other than oil. Great strides were made in the production of explosives, commonly known as TNT, and of synthetic rubber from petroleum products. During the war of 1914-18, toluol was an acute bottleneck in the munitions industry, but petroleum chemistry's advancement has made possible the supplying by the oil industry of ample quantities to meet any emergency, it is said. Similarly, the development of synthetic rubber from petroleum indicated that the United States might be made independent of foreign supplies of the natural product.

Petrology: see GEOLOGY.

Philadelphia, third largest city of the United States and largest city of Pennsylvania (pop. 1,931,334, census of 1940), like some other cities was found to have lost more population since 1930, although its suburbs disclosed a gain of 100,000 times as great as its loss. There also was shown a loss of 1,000,000 in the city's tax valuations; and the school population dropped 6,523 from the 1939 figures. As one-sixth of the national defence work in the country was allotted to the city, the loss in population was repaired, for it amounted to only about 100,000 persons. Efforts to improve the city government's financial position sustained some setbacks, although the wage tax was upheld by the state courts. An attempt to finance sewage disposal by a flat assessment on each property was held by the courts to be an invalid tax, and ruled unconstitutional.

The city's transportation system, which had been a problem to stockholders, underlying companies and car riders, and had been the subject of litigation from 1935 to 1939, came under new man-

agement on Jan. 1, 1940. The solution was found in the merger of the Philadelphia Rapid Transit company and its 64 underlying corporations, which had possession of the original franchises.

The new Philadelphia Transportation company, an \$85,000,000 corporation, which took over the system, began a radical modernizing process immediately. Before the end of 1940, much new rolling stock on the streets, some new roadbeds, new buses had speeded up service and extended several lines. The change had been brought about with great speed, because it was only in Nov. 1939 that Federal Judge George A. Welsh had given his approval to the plan of reorganization. The city's \$12,000,000 Municipal airport was opened in June, at Hog island, displacing the Camden (N.J.) airport. It was given a class-4 rating by the Civil Aeronautics authority, the highest. In June the national Republican convention was held in the Municipal auditorium, when Wendell L. Willkie was nominated for the presidency and Senator Charles L. McNary for the vice-presidency.

(J. JAC.)

Philately. The surprise of the year 1940 was the small number of stamps issued, despite the great change in governments. The bulk of stamps that did appear were from the states not engaged in war, such as the Americas. However, China brought out a new issue, purely for postal purposes. This was made necessary by the loss of her printing establishments, in occupied territory.

The year 1940 saw only 1,497 new stamps, of which 916 were purely for postal purposes, including commemoratives, and the rest mainly either air-mail or semipostal stamps, the last serving partly for postage and partly for charitable works.

The War.—Swift-moving developments robbed stamp-collecting of a promised new variety of stamp; actually in preparation was a stamp that could be used either in France or Great Britain, when the German occupation of France made it unnecessary. Such a stamp has never been issued, and it would have marked an entirely new type of issue. Elsewhere, the expected surcharges for occupied zones did not appear. Norway and Denmark still used their own stamps; Poland, for the short time it sent out mail, had its issues surcharged in the German-occupied region. Of course the Czech issues, surcharged "Böhmen und Mähren," were known before the complete subjugation. Only one Carpatho-Ukrainian stamp appeared. Slovak issues were long and, prior to the blockade, unending.

The British blockade stopped all sending of new issues from axis territory, except by the long and tortuous Russian route. Even such shipments were often intercepted, so axis new issues were not common, except on such mail as did get through. Britain established control of stamp transactions, and all sales and purchases cleared through the trade association, which thus became a quasi-official agency.

Commemoratives.—Commemoratives were, of course, limited mainly to the Americas, although Australia commemorated the Australian imperial forces, embracing all the branches of the service, with a short set of four values, showing the army, navy, flying and nursing corps. The United States commemorated the first peacetime conscription with a set of three values issued on the day of registration (Oct. 16, 1940), with martial emblems, signifying "preparedness" and called the defence issue.

The 50th anniversary of the Pan American union was noted philatelically by several issues of stamps. The United States borrowed from Botticelli's "Primavera" the three dancing figures, used to symbolize the three Americas, South, Central and North. Most of the other members of the union did likewise, though some went to great lengths—in numbers of stamps. Brazil used the portrait of Franklin D. Roosevelt and Brazil's own president,

Getulio Vargas, as the design. On President Roosevelt's request, other nations, which had planned likewise, dropped his picture.

Cuba recognized the visits of two international conventions by stamps, Rotary International and Lions International being thus honoured. Great Britain, despite war worries, broke an old tradition and issued stamps celebrating the 100th anniversary of Britain's and the world's first stamp, with portraits of Victoria and George VI in a traditional frame and background.

Albania, thought to have disappeared from the stamp-issuing world, reappeared with a set of regular and a set of air-mail stamps showing Italian possession.

The United States, besides having the great set of "Heroes of Peace," also commemorated the 75th anniversary of the abolition of slavery by the 13th amendment to the constitution. Also appeared a stamp commemorating the 80th anniversary of the pony express mail service; the 50th anniversary of statehood for Idaho; a similar one for Wyoming, and one for the Cuatrocen-tennial of Coronado, who first explored the southwest.

Literature.—Philatelic literature was enriched by several new books. For beginners and advanced collectors alike, *So You're Collecting Stamps!*, by Mannel Hahn, is a guide book to ways and methods in the hobby, while *Paper Chase*, by Alvin Harlow, is a history of great finds of rare stamps. For specialists, *The Mississippi River and American Waterways Packet Markings*, by Eugene Klein, is one of the outstanding works of the century. As might be expected, these are the products of the U.S., but in Britain another standard work on postal history appeared: *The Postmarks of Great Britain and Ireland*, by R. A. Alcock and F. C. Holland.

Personnel.—Fred J. Melville, dean of British and world-wide philatelic writers, died early in 1940. He was a most prolific writer, but quantity did not interfere with a high quality in his work. He was the author of the article on philately in the *Encyclopædia Britannica*, and also of other standard works. The annual British Philatelic congress proposed a memorial in his honour.

In the United States, H. M. Southgate, of Chevy Chase, Md., passed away in Oct. 1940. He was the founder of the Bureau Issues society, which has done more to focus attention on the work of the bureau of printing and engraving of the U.S., producers of that country's postage stamps since 1894, than any other group, and was one of its greatest students. His close connection with many agencies of the post office department was the source of much of the material on U.S. issues that appeared since 1920, not only in his own voluminous writings, but in those of many others, including the late Beverly King, for whom he secured many original records and drawings. He was the most active of all philatelists in securing the passage of the illustrations law, by which stamps of the U.S. may, under proper restriction, be reproduced for study and comparison in philatelic works.

The defence measures of the United States removed another of the heads of the U.S. Post Office Philatelic agency, for Otho L. Rogers, who headed the bureau since 1937, was called to his post as a captain in the marine corps reserve. No successor was appointed in 1940.

(M. HA.)

Philippines, Commonwealth of the.

The Philippine islands, over 7,000 in number, lie southeast of China, entirely in the tropics, extending for a distance of 1,152 mi. from north to south; area, approximately 114,400 sq.mi.; population (1940) 16,356,000. United States high commissioner, Francis B. Sayre; president of the commonwealth, Manuel L. Quezon; vice-president of the commonwealth, Sergio Osmeña; resident commissioner at Washington, Joaquín M. Elizalde;

THE PHILIPPINES reconsidered their stand for independence from the U.S.A. in 1940, as pointed out by Elderman of the *Washington Post* in this cartoon captioned "Are You Standing By?"

status until 1946, United States possession; basic law, Philippine Independence act, passed in 1934, amended in 1939 and Philippine constitution adopted in accordance therewith; national assembly unicameral. Until full independence is acquired on July 4, 1946, constitutional amendments and all legislation affecting currency, coinage, imports, exports and immigration require the approval of the president of the United States; acts tending to impair the financial standing of the Philippines may be suspended by the president of the United States; foreign affairs are under control of the United States; decisions of local courts are subject to review by the supreme court of the United States.

History.—*Changes in Economic Legislation Effective in 1940.*—Reciprocal free trade between the United States and the Philippines, established in 1909, resulted in a high standard of living in the Philippines, a close integration of Philippine with United States economy and in some instances sharp competition with agricultural production in the continental United States. By 1934 it was obvious that too abrupt a severing of Philippine-United States economic ties would prove disastrous to the Philippine economy. The Philippine Independence act of 1934, therefore embodied a program based on the grant of independence at the end of a ten-year interim period, during which a Philippine commonwealth government was to function with broad home-rule powers and Philippine economic dependence upon United States markets was to be lessened through the imposition of moderate but progressively increasing restrictions upon Philippine exports to the United States.

Accordingly, the Independence act, while continuing United States-Philippine trade generally on a duty-free basis during the ten-year period prior to independence, established annual duty-free quotas for sugar, coco-nut oil and cordage, with shipments beyond the quota amounts subject to the full American duty. In

also provided for the imposition by the commonwealth during the second half of the ten-year period of export taxes upon Philippine goods shipped to the United States, equal, in 1941, to 5% of the applicable United States import duties, if any, and increasing by 5% each year until they reach 25% in 1945-46. After the date of independence, that is, July 4, 1946, all Philippine products shipped to the United States were to be subject to 100% of the United States duties. The proceeds of these export taxes are to be paid into the United States treasury to be held as a sinking fund for the payment of Philippine bonded indebtedness.

In order to prevent certain basic Philippine industries from being dangerously disrupted or wiped out by the export taxes required under the Independence act, a Joint Preparatory Committee on Philippine Affairs, established by President Roosevelt in April 1937, after a year's intensive study recommended that Philippine export taxes should not be imposed upon shipments of coco-nut oil, cigars, scrap and filler tobacco and pearl buttons, but that in their stead a quota should be imposed restricting the duty-free shipments of each of these commodities to the United States to a progressively diminishing amount. Furthermore, the joint committee believed that as an inevitable consequence of the abrupt elimination of all Philippine preferences in the United States market at the date of independence "a number of important enterprises in the Philippines will be forced to liquidate much more rapidly than new enterprises can probably be developed to replace them." Accordingly, the committee recommended that subsequent to independence U.S. duties should be progressively increased by 5% a year beginning at 25% of the full U.S. duties in 1946 and reaching 100% in 1961. These two major recommendations of the committee, together with a number of minor ones, were embodied in a bill introduced in congress early in 1939.

Various members of the senate, however, felt that it would be premature at that time to enact trade provisions for the period following 1946. Accordingly, the post-independence provisions were dropped from the bill; and provision was made for the calling of a joint trade conference at least two years prior to 1946 "for the purpose of formulating recommendations as to future trade relations between the United States and the independent Philippine republic."

As thus modified, the bill substantially embodying the various recommendations of the joint committee with respect to the commonwealth period was passed by congress and approved by President Roosevelt on Aug. 7, 1939. The principal provisions of this act came into force on Jan. 1, 1940. The new export taxes and reduced quotas under this act first became effective on Jan. 1, 1941.

Question of Political Independence.—Notwithstanding the fact that the Independence act provides for complete independence in 1946, future political relations between the United States and the Philippines continued through 1940 to be the subject of active discussion. Although Filipino political leaders who have spent the greater part of their lives struggling to attain Philippine independence find it well nigh impossible, now that it is in sight, to oppose it, there is nevertheless a growing feeling of uneasiness on the part of business and other groups lest independence entail grave economic disruption and possible disaster and lest it also lead to conquest of the Philippines by a totalitarian nation.

For several years the commonwealth government has been following a carefully prepared program of military training which it believed would provide sufficient defensive power by 1946 to make an invasion of the islands too costly to be profitable. In the light of recent international events, however, President Quezon, on March 26, 1940, publicly stated that the Filipinos

would not be able to defend their shores against aggression by a first-class power for some time after independence.

President Quezon and other outstanding Filipino leaders nevertheless continued during 1940 to advocate political independence in 1946 as scheduled.

Constitutional Amendments.—Three amendments to the Philippine constitution were proposed by the national assembly by a resolution of Sept. 15, 1939, as amended by a resolution of April 11, 1940. These amendments provide for (1) a four-year term in place of the present single six-year term for the commonwealth president and vice-president, provided that no person may serve as president for more than eight consecutive years; (2) a bicameral legislature in place of the present unicameral national assembly, by creation of a senate to be elected at large and a house of representatives; and (3) the establishment of a commission on elections to administer all laws relating to the conduct of elections. These amendments were approved by plebiscite of the electorate on June 18, 1940 and were approved by the president of the United States, as required by the Philippine Independence act, on Dec. 2, 1940.

Important Legislation.—A new immigration law was enacted by the commonwealth in May 1940 and approved by the president of the United States to become effective Jan. 1, 1941. This act provides for a quota system under which not more than 500 "quota immigrants" of any one nationality may be admitted into the Philippines in any one year.

The Philippine constitution provides that the public school system shall be "primarily conducted in the English language." An act (No. 570), approved June 7, 1940, declares Tagalog "one of the official languages of the Philippines" after July 4, 1946. President Quezon announced in a speech on Feb. 25, 1940 that Tagalog would be the medium of instruction in the elementary grades of public schools after independence. Tagalog is a dialect spoken in Manila and in the surrounding regions of central Luzon and at the present time more Filipinos are said to speak and understand English than they do Tagalog.

Much attention was attracted by a Commonwealth act (No. 600) approved on Aug. 14, 1940, giving to President Quezon remarkably broad emergency powers. This act, almost bare of restrictions and limitations, empowers him in sweeping terms to suppress subversive activities, to require citizens "not engaged in any useful occupation" to work on farms or elsewhere, to take over farm lands and industrial establishments to ensure continued production, to prohibit lockouts and strikes, to regulate hours of work, rents and prices of articles "of prime necessity," to take over "any public service or enterprise," to commandeer ships and other means of transportation and to prevent monopolization.

General Political Issues.—In a public address on July 16, 1940, President Quezon declared that Filipinos must discard the "fetish" that democracy cannot exist without political parties. His views, which were interpreted as advocating a one-party system, were widely commented on throughout the United States. Subsequently, President Quezon indicated that it was not a one-party system but a no-party system that he desired.

During 1940 President Quezon and General Emilio Aguinaldo were reconciled after many years of political and personal differences. Mr. Quezon broke with General Aguinaldo in the early '20s when the latter remained loyal to Governor General Leonard Wood during Mr. Quezon's political attack against him. Subsequently General Aguinaldo unsuccessfully ran against President Quezon for the presidency of the commonwealth. General Aguinaldo, ever since the Philippine insurrection, has been head of the veterans of that uprising and for a number of years was the chief independent political opponent of Mr. Quezon.

Trade and Finance.—Philippine imports totalled \$122,767,-

728 in 1939, 7.4% less than in 1938. Exports totalled \$158,052,803, 7.5% greater than in 1938. Imports from the United States were \$83,776,695, 7.7% less than in 1938. Exports to the United States were \$129,657,032, an increase of 6.6% over 1938. The United States continued to be by far the most important supplier of Philippine imports and the chief market for Philippine exports, accounting for 68% of its total imports and 82% of its total exports. Japan, which ranked second, provided 6% of the Philippines' imports and took 5% of its exports. Philippine imports of cotton cloth from Japan were limited by a "gentleman's agreement" under which Japan undertook not to export to the Philippines more than 11,250,000 square metres of such cloth in any quarter. This agreement, which first became effective on Aug. 1, 1935, was renewed for one year, beginning Aug. 1, 1940.

The general fund, central government, showed 1939 income \$51,195,077 and expenditures \$56,372,681—respectively 16% and 4% over corresponding figures for 1938. The accumulated current surplus account was \$29,029,386 at the end of 1939 or 17.5% below 1938. In addition to local income, the central government receives about \$17,000,000 annually from the United States coconut oil excise tax. The public debt was \$73,028,500 at the end of 1939. Against this were sinking funds of \$35,103,592. The United States government is not responsible for Philippine public bonds issued after May 1, 1934. Philosophy.

The collapse of France in 1940 and the besiegement of popular institutions in Europe, if not in America, have laid harsh emphasis on what is called the moral decay of the democratic cultures. Morality, indeed, as well as morale, is probably the most urgent philosophical problem, not only of the liberal societies but also of those peoples who threaten them. Their respective statements are different, but in both cases it is a matter of the morals of survival and what is necessary to that end. War imposes its own morality on all who participate. In this case the compulsion is towards intense social solidarity, co-operation, power as the prime desiderata.

Though it is true of course that the moral superiority or moral decadence of a culture may not be wholly demonstrable by the military results, victory or defeat at arms does impose a new and often very difficult moral problem on the members of a group. It may completely change the moral universe in which they operate. General Pétain in asking lenience of Germany for France is reported to have said, "If you will master your victory, we shall try to master our defeat." This for more than two decades has been the most urgent moral problem.

In addition to these unorganized philosophies of defeat and victory, of fear and rage, of ideological pluralism, democracy, the experimental point of view and of ideological monism or totalitarianism, 1940 was marked by the publication of several philosophical books of more traditional importance.

George Santayana's *The Realm of Spirit* completes his great series on the realms of being. In this realm of pure awareness, disintoxicated as it were from values, Santayana elaborates on a different and perhaps more mystical basis the philosophical attitudes that he expressed 35 years ago in his *Life of Reason*. Probably the difficulty that many readers find in his latest book as in most of his other works is that Santayana, after the classical manner, tries to deal separately with functions and factors of the human situation that are intelligible only in a "gestalt" or integrated whole. He is a convinced materialist, but his separate realms of essence, of spirit, of truth are with difficulty integrated with his realm of matter. These problems are faced with simplicity and frankness in Santayana's rejoinder to a group of essays on his work entitled *The Philosophy of George Santayana*, vol. II

of *The Library of Living Philosophers* edited by Paul A. Schilpp. The rejoinder, which occupies the latter part of the book, is the clearest and perhaps philosophically the most important of his works. Faced by his friends and critics, the poet and philosopher tries to come to terms with the seeming contradictions and obscurities of his work.

In *The Ways of Things* W. P. Montague brings to fruition his animistic materialism. More naïvely, but also with a more modern directness than does Santayana, he too tries to include spiritualism in his materialism. By means of the concept of anergy he identifies consciousness with the potential energy resident in the nervous system. This assumption that potential energy is a substantive presence of some sort rather than a certain kind of absence of action may be doubted by the scientifically-minded person, but the concept of anergy is at least a fresh and courageous attempt to reconcile spirit with matter.

Max Otto in *The Human Enterprise* asks what philosophy can do as a social and human influence in this era of change. Can it take over the function that religion once had? Reality for Otto is not something behind experience but includes whatever reality is experienced to be, and values stand not on a cosmic pedestal but on an intimately human foundation. He reaffirms his well-known agnostic position as to God and builds his philosophy as a humanistic instrument of intervention in social and individual affairs.

In E. S. Brightman's *A Philosophy of Religion* the "given" is treated as external to God's will and thus imposes limitations on it. Only by accepting the finiteness of God, says Professor Brightman, can we face clearly the conditions of our world. In *An Inquiry Into Meaning and Truth* Bertrand Russell makes his first major contribution to semantics and the analysis of language. Among other books of 1940 are *Philosophical Essays in Memory of Edmund Husserl* edited by Marvin Farber; *Die Sachlichkeit der Wissenschaft* by Max Wundt; *The Arts and the Art of Criticism* by T. M. Greene; *Civilization in East and West* by H. N. Spaulding; *The Nature of the World* by W. T. Stace. A non-technical book but of philosophical interest is *The Wave of the Future* by Anne Morrow Lindbergh. The foundation of the journal of *Philosophy and Phenomenological Research* should also be noted. (B. B.)

Phosphates.

Mineral phosphates, chiefly phosphate rock, and phosphate of calcium, are basic fertilizer material, and as such support an extensive producing industry. A world production of 11,760,000 metric tons in 1930 declined to 6,678,000 tons in 1932, and recovered to 12,050,000 tons in 1939. The United States is the leading producer, with 32% of the total, followed by Tunisia 15%, soviet union 13%, French Morocco 12%, Ocean and Nauru islands 10%, Algeria 5%, and Egypt 4%. These seven countries account for 91% of the total, and the remaining 9% is scattered among about 30 others. The general producing area in northern Africa, including Tunisia, Morocco and Algeria, has not made any material recovery from the depression drop. Russia is the only producer which has shown an exceptional growth, increasing steadily from 200,000 tons in 1930 to 1,791,000 tons in 1938. The United States output of 3,989,000 tons in 1930 dropped to 1,734,000 tons in 1932, and rose to 4,019,000 tons in 1937, about one-quarter of which was exported. In 1938 production declined to 3,799,000 tons, rising in 1939 to 3,817,000. (See also FERTILIZERS.) (G. A. Ro.)

Photography.

General Photography.—There were notable advances in several fields. The Kodatron

Above, left: **THE ONLY PHOTOGRAPHS** ever taken of albatrosses in U.S. coastal waters were snapped in June 1940 off the shore of California. To attract the birds, the photographer spread cod-liver oil and pieces of suet on the water

Above, right: **AN UNMUFFLED SNEEZE**, photographed in 1940 with high-speed camera equipment and a 1/30,000-sec. exposure to demonstrate the dangers of heedlessness in spreading disease

Left: **PHOTOGRAPH** made in 1/30,000 sec. using a Kodatron Speedlamp

Below: **X-RAY PHOTOGRAPH** made with 1/1,000,000-sec. exposure, of a player kicking a football

Below: **AERIAL PHOTOGRAPH** of Rochester, N.Y., taken at night in 1940. A flash-light bomb dropped from the plane and synchronized with the camera provided enough illumination for recording of small details

Speedlamp, designed by Edgerton, was introduced commercially. Operated by a condenser discharge in a gas-filled tube, it produces extremely bright flashes of $1/30,000$ sec. duration and can be synchronized with camera shutters. Its uses are mainly in the commercial, illustrative, news and technical fields. Improvements in flash bulbs included the introduction of midget sizes, coating the bulbs with blue varnish to permit their use with daylight colour film and a device for permitting concentration of the light from flash bulbs on the subject. The treatment of lens surfaces to reduce reflections which cause flare and to increase the transmission of multi-component lenses is an established practice. New types of optical glass of high refractive index were made and lenses were prepared from plastic materials, the most interesting being a 16-in. aspheric condenser made from Lucite by turning on a lathe and polishing. It was used in the Kodak Research laboratories for illuminating colour transparencies for making separation negatives. Several varieties of variable contrast printing papers were introduced. They are improvements on papers first described by Fischer in 1912 and give contrasts which depend on the colour of the light by which they are exposed. They consist of mixtures of emulsions which give soft and hard contrasts and which are sensitive to different colours. By exposing them through blue or yellow filters, or combinations of them, a wide range of contrast is obtainable. Photography played an important part in the war, for propaganda, instruction, reconnaissance and the recording of the effects of aerial activity. Many planes carry cameras to record the effectiveness of bombing operations and the results of aerial combat. The necessity for high flying imposed by the effectiveness of anti-aircraft and fighter plane defence has required the use of lenses of long focal length combined with infra-red film of increased speed to permit penetration of haze. Infra-red photography was also used to detect camouflage and it was reported that colour photography was tried for this purpose.

In order to simplify defence, most aerial operations were carried out at night time and the U.S. army air corps published information about the use of large flash bombs dropped from the planes to permit photography of the ground at night. The flash is synchronized with the shutters of the cameras by photo-electric devices. The rapid pace of modern operations frequently makes it desirable to deliver photographs within a few minutes after the time they are made and with this end in view, methods of rapidly processing negatives and prints were worked out.

Large numbers of old photographs and negatives have faded, primarily as a result of having been inadequately fixed and washed. Hypo eliminators have been proposed with relatively little success, but it was shown that hypo can be eliminated very effectively with the result that negatives and prints can be rendered very stable. Negatives are washed, bathed for a short time in ammonia and washed again. In the case of papers, a weak solution containing ammonia and hydrogen peroxide is used. To prevent fading from external agents such as hydrogen sulphide gas, prints are toned with gold.

There was an increase in interest in stereoscopic photography. A number of commercial and educational stereoscopic motion picture and still films were made using twin lens cameras and projectors and viewing the picture pairs by Polaroid glasses.

In October, E. H. Land demonstrated an entirely novel method of making single stereo prints on paper for viewing through polarizing glasses and called Vectographic Three-dimensional pictures. There was also described the Winnek Trivision method of making stereoscopic transparencies, using lenticular film and capable of giving results in colour.

Many of the features of cameras which had an appeal to the advanced amateur are now (1940) being applied to the cheaper

models of cameras so that greater flexibility of apparatus is available to those with limited resources. These applications included the use of the reflex principle and flash synchronizers in box cameras and the addition of coupled range finders to cheaper forms of miniature cameras.

The importation of photographic apparatus from Europe was materially reduced and American manufacturers made available models which should satisfy all needs and were also making shutters and lenses which are unsurpassed by any previously imported.

Several new models of exposure meter have appeared, both for estimating camera exposures and for determining printing times. New apparatus of high precision was available in the enlarging field and collapsible, portable enlargers were made for the itinerant photographer. The American Standards association had several committees actively engaged in photographic standardization and tentative standards were proposed for the estimation and specification of film speeds, film dimensions and projection equipment.

Colour Photography.—No new colour processes were disclosed during 1940 but there was a steady increase in the use of Kodachrome, particularly for making amateur motion pictures and colour transparencies in miniature cameras. Kodachrome in cut sheet form was replacing or supplementing to a significant degree the use of three-colour, one-exposure cameras and colour prints in the commercial advertising field, and the photoengravers have mastered very successfully the problem of making colour printing plates from such colour transparencies. The publication of the patents relating to Kodachrome and similar processes disclosed the names of chemicals which could be used to obtain colour images and a number of people took advantage of this to devise methods of making colour prints on paper and of toning prints in colours. There was some interest in making colour prints for commercial purposes by methods involving hand manipulation. In one method, black and white prints were bleached and redeveloped locally by coupler developers in conjunction with masking varnishes. In the Crawford Flexichrome process, a black dye image was made in a gelatin relief and colours were applied by a brush to replace the black dye as required and give a colour picture with modelling produced by the black dye left in it.

Motion Picture Photography.—There was a steady output of research in the motion picture industry, but no innovations of striking import appeared during the year. The decrease in the foreign market reduced production somewhat. The U.S. department of commerce report disclosed that at the beginning of 1940 there were 67,129 motion picture theatres in the world, of which 65,006 were wired for sound. Of interest is the increase in Latin America and the Far East, but the number of theatres in the United States, all wired for sound, increased from 16,251 in 1939 to 17,003 in 1940. There was a steady increase in the use and quality of Technicolor and the Disney-Technicolor film. *Fantasia* was an interesting experiment in the interpretation of music by the colour cartoon. In the field of amateur cinematography, which is a large branch of the whole photographic industry, there was a definite growth of interest in the use of 8-mm. film and magazine-loading 8-mm. cameras were introduced. There appeared to be an increase in the use of 16-mm. colour film for advertising and industrial purposes. Duplicates of 16-mm. colour films can now (1940) be made of high quality and sound can be printed on them from black and white sound records. Television was still in its infancy and most of the broadcasts were made by scanning motion picture film. The Columbia Broadcasting system demonstrated colour television using 16-mm. Kodachrome films as the subjects. The method used the additive three-colour principle, with a rotating disk carrying red, blue and green filters at the scanning and receiving ends.

Applications.—The interest in photography for documentary purposes was growing. Great projects were under way for copying official records and for supplying copies of works of art, books and other documents for distribution to schools, lecturers and the general public. Much of this was in colour and in the popular form of the 2-in. square slide. Salesmen were equipped with slides for demonstrating wares which it would be difficult to transport from place to place and these were frequently accompanied by dialogue from sound-on-film or disk. In the war countries, many photographs were made of valuable and irreplaceable documents for storing in several scattered localities, thereby eliminating the chance of destruction by aerial or other form of attack. A new photographic plate, known as the H.R. plate, was introduced and was of special value for the preparation of graticules. It gives a dense sharp image and has a resolving power of some 500 lines to the millimetre, far higher than any normal photographic lens.

Analogous to the discharge lamp used for making high speed photographs is the high-speed X-ray technique developed in the Westinghouse Research laboratories. A discharge from a bank of condensers is passed through a cold cathode X-ray tube, giving a surge of current of about 1/1,000,000 of a second in duration. X-ray photographs hitherto unattainable were thus made of rapidly moving objects, such as a bullet passing through a block of wood and the interior of a vacuum cleaner in operation. In photomicrography, the method of making colour photographs of etched metal surfaces of satisfactory colour quality appeared to have been worked out.

There was a steady growth of the application of colour in engraving and a method was demonstrated by which the copy is prepared by using fluorescent paints. Normal separation negatives are made, together with an additional negative using the fluorescence resulting from exposing the copy to ultra-violet radiation. From the combination, printing plates can be made which require less fine etching by hand than the normal methods.

The electron microscope produced some striking results during the year and its use was likely to increase with the availability of a commercial model. The instrument resolved structures impossible of resolution in the normal microscope. Results were published of its application to the study of the developed photographic silver grain, revealing a hitherto unsuspected fibrous structure.

There was a welcome increase in the teaching of the principles of photography in the schools, universities and camera clubs and a number of textbooks and instruction manuals were published.

Photography, Miniature Camera. Continuing the trend from 1939 and through 1940, there was a definite stepping up in the production and sale of the larger miniature camera sizes. These cameras include the 2½x2½ reflexes such as the Rolleiflex, Ikoflex, Argoflex and the 2½x3¼ Miniature Speed Graphic. The smaller imported 35 mm. cameras have shown a falling off in sales volume during the last half of 1940. This change has come from the changing public purchasing and also from the difficulty of importing from Germany and other continental countries.

With the increasing effectiveness of the British blockade, there were few camera imports into England and America from Germany during the latter part of 1940. Small shipments came across the Pacific as well as the Atlantic oceans to America, but the

mounting insurance and freight costs were costly factors. The large stocks of miniature cameras which came into England and America about the time the European war broke out in 1939 were sold before the close of 1940. This left the field open to the British and American camera manufacturers.

Domestic manufacturers have been slow to bring out new camera models. Outside of the cheaper miniature camera models such as the 2½x2½ Argoflex, the Kodak 35 with coupled range finder and several streamlined Argus 35 mm. cameras there was little activity in new products.

The long awaited Kodak Ektra 35 mm. camera was shown for the first and only time at the Chicago Photographic convention in Aug. 1940. This new miniature camera has many distinctive features which will undoubtedly place it in the fine precision class along with the Contax and Leica cameras. The Ektra 35 mm. camera was originally scheduled for public sale during November, but by the end of 1940, the Eastman Kodak company reported that this camera would not make its appearance until sometime in 1941. Defence orders were one of the principal factors in the postponement.

Important features of the Kodak Ektra camera include: (1) interchangeable film backs to hold black and white or colour films; (2) compensating built-in view finder for various focal length lenses; (3) left handed film advance lever; (4) coated anti-reflection f/2 50 mm. lens, which is said to improve Kodachrome colour pictures; (5) special film counter, etc. Price of the Ektra camera would be in the same class as the Contax and Leica.

While the development of new miniature cameras was slow during 1940, there was a greater change in the accessory fields. Here many new products appeared every week for all the miniature cameras.

These included new filters, lens shades, combination filter mounts and lens shades, copying attachments, stereoscopic attachments, range finders, self timers and special carrying cases.

There was also a trend for the production of adapters which permit the use of 35 mm. films in the larger miniature cameras such as the Super Ikonta B and the Rolleiflex and Rolleicord. There was also a Kodak Bantam adapter which fits on the back of the Recomar and similar cameras. This latter 35 mm. adapter permits direct ground glass visual focus. The adapter film back is then slid into position for making the exposure. These adapters permit the economical use of 35 mm. Kodachrome film in the larger cameras.

A new trend which promised to continue with mounting sales during 1941 was seen in the miniature box cameras with built-in flash units. Agfa Ansco introduced the Agfa Pioneer and Agfa Chief cameras followed by the first Kodak Brownie Flash camera which made its appearance toward the end of Dec. 1940. These cameras which sold at prices below \$4.00 produce good pictures and require nothing more than the snapping on of the flash unit to make them ready for taking pictures with flashbulbs.

Related to the miniature camera field are the numerous so-called fine grain developers which were introduced during 1940. All these new developers were placed on the market by small firms which advertised extravagant claims, such as increased film speeds, finer grain, greater tone gradations, etc. Without exception, these claims were not fulfilled.

Result was that by the close of 1940 most of these new glamour developers were either off the market or their sales dwindled to an all-time low for the year. Photographers were finding that the standard developers produced by the larger photographic manufacturing firms insured the production of good miniature camera negatives. The new untested developers carrying their fantastic claims were meeting harder sales resistance. (See also PHOTOGRAPHY.) (W. D. MN.)

Physics. Physicists outside America during 1940 were mostly occupied with research on secret war problems or were prevented from continuing their scientific work by war. This article will therefore be concerned with scientific work done in the United States.

Nuclear Physics.—The fission of uranium atoms discovered in 1939 was the subject of several researches. A. O. Nier at the University of Minnesota obtained minute quantities of pure uranium of atomic weight 235 by separating this isotope from the much more abundant uranium of atomic weight 238 by means of a mass spectrograph. He found, as was expected, that the uranium 235 undergoes fission when exposed to slow neutrons but that the uranium 238 does not.

If a large quantity of pure uranium 235 could be obtained it could be used as a source of heat energy for power production. For example it could be used to drive an aeroplane and would enable the aeroplane to stay up almost indefinitely without having to come down to refuel. The uranium 235 undergoes fission when exposed to neutrons and emits neutrons during fission so that fission should continue in a sufficiently large quantity. The energy evolved during fission is enormous. One pound of uranium 235 would give 10,000 h.p. for more than a month. The difficulty of separating large quantities of pure uranium 235 is very great but since small quantities have been separated it is certainly possible that the difficulties may eventually be overcome.

Grosse and Booth at Columbia university found that zirconium and columbium are produced by uranium fission. At least one radioactive isotope of every element from bromine to ekamanganese and from antimony to lanthanum has been found among the products of uranium fission.

Many nuclear reactions were studied during 1940: as an example, the carbon deuterium reactions studied by Bonner and Bennett at the Rice institute. In these reactions a deuterium atom of atomic weight 2 combines with a carbon atom of atomic weight 12 to give a nitrogen atom of atomic weight 14. The nitrogen atom is in an excited state with more than its normal energy and may emit its excess of energy as a gamma ray or it may emit a proton so changing to carbon of atomic weight 13 or a neutron so changing into nitrogen of atomic weight 13. The carbon was bombarded with high velocity deuterium nuclei and the way in which the yield of gamma rays, protons and neutrons varied with the kinetic energy of the deuterium nuclei was determined. It was found that there are a series of energies at which the yields have maximum values.

Cosmic Rays.—The heavy electrons or mesotrons discovered in cosmic rays in 1938 were investigated by several observers in 1940. The mesotron is a charged particle with a mass about 200 times that of an electron and so far has only been found in cosmic rays. It is believed that mesotrons are unstable so that after a very short life of only a few millionths of a second they disintegrate into an ordinary electron and a gamma ray or neutrino. Neher and Stever of the California Institute of Technology estimated the average life of mesotrons by comparing the absorption of cosmic rays in water with that in an equal mass of air. They made measurements in two lakes, one about 13,000 ft. above sea level and the other 1,000 ft. The cosmic ray intensity was measured with an electroscope at different depths below the surface of each lake. Twelve thousand feet of air has the same mass per square foot as about 12 ft. of water, so the measurements in the upper lake were compared with those in the lower lake at depths 12 ft. smaller. The cosmic rays at the upper lake therefore passed through 12 ft. more water but 12,000 ft. less air than at the lower lake. It was found that the cosmic ray intensity was about 15% greater at the upper lake. This difference was attributed to the disappearing of some of the mesotrons as they

moved down 12,000 ft. through the air. The mesotrons travel with nearly the velocity of light and so take about $1/100,000$ of a second to go 12,000 ft. The average life of a mesotron at rest was calculated from these results to be about $3/1,000,000$ of a second.

Herzog and Bostick at Chicago during an aeroplane flight at 29,000 ft. obtained a remarkable photograph showing production of a pair of mesotrons in a Wilson expansion chamber. One mesotron was positive and the other negative and it is supposed that they were produced by a high energy photon just as positive and negative electron pairs are produced. To produce a pair of electrons requires a photon of more than 1,000,000 electron volts energy; so, to produce a pair of mesotrons requires a photon of more than 200,000,000 electron volts energy. Herzog and Bostick also obtained photographs showing the production of an electron at the end of a mesotron track presumably by the disintegration of the mesotron.

Variation of Mass with Velocity.—According to Einstein's theory of relativity energy has mass so that the mass of a moving particle is greater than its mass when at rest, the difference being the mass of its kinetic energy. The increase of mass is small until the velocity approaches that of light. If m denotes the mass at rest, then the mass when moving with a velocity v is $m/\sqrt{1-v^2/c^2}$ where c is the velocity of light. This fundamentally important result was verified experimentally many years ago by Kaufmann and later by Bucherer and others by observations on the electrons emitted by radium which have velocities up to nearly that of light. A critical examination of these experiments showed that they were much less exact than had been supposed so that Einstein's relation between mass and velocity was not really verified except very roughly.

Rogers, McReynolds and Rogers at the Rice institute have made accurate measurements of the masses and velocities of the three intense beta rays emitted by radium B. The rays were deflected by a radial electric field X so that they moved along a circular path of radius R and $XR = mv^2/e$ where m is the mass, v the velocity, and e the charge. Previous measurements on the deflection of these rays by a magnetic field H give $H\rho = mv/e$ where ρ is the radius of the circular path in the magnetic field. Hence $v = XR/H\rho$ and $m = e(H\rho)^2/XR$. The three beta rays were found to have velocities 0.6337, 0.6961 and 0.7496 of that of light and the masses agreed accurately with those calculated by Einstein's equation.

Electron Microscopes.—During 1940 an electron microscope was developed by the RCA Research laboratories suitable for use in biological and other researches. In such instruments a beam of high speed electrons is used instead of light. The electrons are focussed by means of suitable magnetic fields instead of the lenses used in ordinary microscopes. The smallest object the structure of which can be seen with a microscope has a length about equal to that of the wave length of the light used which, with ordinary light, is a few hundred thousandths of an inch. Electron waves are much shorter than light waves so with an electron microscope the structure of much smaller objects can be seen and much higher magnifications usefully employed. Magnifications of 20,000 diameters have been used with electron microscopes and the structure of bacteria and other small bodies, much too small to show any structure with ordinary microscopes, can be seen. It is even claimed that the individual molecules in some crystals can be observed. The electron microscope will certainly prove a very valuable instrument for scientific research.

Thermionic Emission from Crystal Faces.—The emission of electrons by metals at high temperatures was thoroughly investigated by O. W. Richardson and many others early in the present century. The commercial applications of this thermionic emis-

sion in the vacuum tubes used in radio, long distance telephony and for many other purposes are well known. The emission has hitherto been studied with ordinary metallic wires consisting of many minute crystals orientated at random. In 1940 M. H. Nichols at the Massachusetts Institute of Technology published an account of experiments on the thermionic emission from tungsten wires consisting of a single crystal with one of the face diagonals parallel to the axis of the wire. He found that the emission is different from different faces of the crystal. The thermionic work function, which is a measure of the work an electron must do in order to escape from the metal, varied from 4.35 volts for the (111) crystal direction to 4.65 volts for the (110) crystal direction. These results will be useful in connection with the theory of thermionic emission and electrical conductivity of metals.

Radiofrequency Spectra of Molecules.—At Columbia university Rabi and his collaborators continued their important work on radiofrequency spectra of molecules in a magnetic field. They studied the hydrogen deuterium molecule and the deuterium deuterium molecule. In this work the molecules are orientated by a strong steady magnetic field, and a weak rapidly oscillating magnetic field perpendicular to the steady field also acts on them. The frequency of the alternating field is varied and it is found that for certain definite values of this frequency the orientation by the strong steady field is destroyed. From the values of these frequencies the magnetic moments of the molecules and their component atoms can be calculated. They find it necessary to assume that the deuteron, that is, the nucleus of a deuterium atom, has a quadrupole electrical moment. Two equal electrical charges, one positive and the other negative, very near together have a dipole moment equal to the product of one of the charges and the distance between them. Two equal positive charges e with a negative charge $-2e$ between them give a quadrupole moment. Since a deuteron is supposed to consist of an electrically neutral particle or neutron and a positively charged particle or proton it is surprising that it should appear to have a quadrupole moment.

Giant Cyclotron.—The Rockefeller foundation made an appropriation of \$1,150,000 to the University of California for the construction of a 4,500 ton cyclotron. The university will provide an additional \$250,000. The cyclotron will be built under the supervision of E. O. Lawrence who was awarded a Nobel prize for his invention of the cyclotron. The magnet of the cyclotron will have two flat circular pole pieces 15 ft. in diameter and 3 ft. 4 in. apart. It will be built out of steel plates with a total weight of about 4,500 tons. Between the pole pieces there will be a vacuum chamber containing a circular metal box divided into two equal halves called dees. By means of an electrical oscillator an alternating voltage will be maintained between the dees. Positively charged atoms such as protons or deuterons are supplied by an ion source near the centre of the dees. The positively charged atoms move round circular paths inside the dees in the magnetic field of the large magnet. Half of each circular path is in one dee and half in the other. The frequency of the alternating voltage between the dees is adjusted so that the voltage is reversed twice during the time an atom takes to go once round. As an atom goes from one dee to the other it is accelerated by the voltage between the dees and so as the atom goes round and round it is accelerated twice during each revolution. The circular paths get larger as the velocity of the atom increases so that the time to go once round remains constant. If for example the voltage between the dees is 50,000 volts then when the atom has gone round 1,000 times it will have kinetic energy corresponding to 100,000,000 volts.

With the giant cyclotron it is expected to obtain deuterons with 100,000,000 volts energy. These high energy particles will

ELECTRON MICROSCOPE with magnifying power of 25,000 diameters, demonstrated in April 1940 by Radio Corporation of America

be used to produce atomic disintegrations and the results are expected to greatly increase the knowledge of atomic structure. It is expected that the new cyclotron will be completed by 1944. (H. A. W.)

Physiology. Several interesting and important contributions were made in a number of physiological fields during 1940. A gastric-secretory inhibitory substance was found in canine and human urine. It was termed "urogastrone" to distinguish it from enterogastrone. Enterogastrone is formed when fats come in contact with the mucosa of the upper intestine and inhibits gastric secretion and motility. The source of uro-

gastrone in the body has not been determined with certainty. Urogastrone has been obtained in a form sufficiently pure to permit its experimental use in the human subject. When injected subcutaneously, this substance depresses the secretion of acid by the stomach in normal persons. It is hoped that urogastrone will prove to be of value in the management of peptic ulcer, especially in those patients who secrete large amounts of acid. The substance, however, is not available in sufficiently pure form nor in sufficient quantity to permit its clinical trial.

Hypertension.—A number of facts of both theoretical and practical importance were revealed by extensive investigations in this field. In previous years a substance called renin was extracted from the kidney. Its intravenous injection causes a rise in blood pressure. From careful studies of the mechanism of renin tachyphylaxis (decreased blood-pressure-raising response to repeated injections), it has been concluded that renin is an enzyme without pressor properties *per se* and reacts with an activator present in the blood to form a pressor substance. The latter may provide the body with an humoral mechanism for the regulation of blood pressure. This pressor substance has been called "angiotonin" and its isolation as the crystalline oxalate and picrate was announced. It is believed that the development of renin tachyphylaxis is the result of two factors: (a) the exhaustion of renin activator and (b) the appearance of an antipressor substance. Attempts to isolate this antipressor substance have led to results which may prove to be of considerable clinical importance. A substance was found in kidney extracts which effectively reduces arterial pressure in hypertensive human beings, dogs and rats for prolonged periods and simultaneously reduces the ability of the plasma to activate renin and angiotonin. The active principle appears to be distinct from all known depressor substances. It has been tested only in a limited number of human patients and has produced a sharp and prolonged fall in blood pressure and marked symptomatic improvement.

The evidence available is inadequate to permit any statement in regard to its ultimate clinical value, but the results so far obtained appear to be promising.

Intermediary Metabolism.—When "tracer elements" (isotopes) were made available by the physicist and physical chemist, a very useful method for tracing the fate of various food elements in the body was provided. The stable isotopes of hydrogen, oxygen, nitrogen, carbon and sulphur produced by fractionation of the natural elements have been available for some time and have been employed in the study of intermediary fat and protein metabolism.

When these "tracer elements" are introduced into the fat molecule or the amino acid (building stone of protein) molecule, the molecule is labelled. This renders it possible to determine how the body utilizes and disposes of the labelled molecules. With the perfection of the cyclotron, a large number of artificially produced radioactive "tracer elements" have become available.

During 1940, synthetic thiamin (vitamin B₁, anti-beri-beri vitamin), prepared with radioactive sulphur, was employed to follow the course of this vitamin in the body. Radioactive calcium was employed to time the passage of this element through the body. It was found that a period of 12 hours is necessary for a test dose of radioactive iron to pass through the stomach and small intestine of the rat. It was also demonstrated in these studies that 50% of the absorbed iron accumulated in the muscles and that anaemic rats retained almost twice as much of the ingested iron as normal rats. Tracer elements provide information which often cannot be obtained in any other way. The field is new and promises to yield a vast amount of useful information.

Physiology of Flight and High Altitudes.—Renewed interest in aviation, stimulated by the European war, intensified research

in this field. A considerable number of investigations were carried out both during actual flight and also during "ascents" in specially designed low pressure chambers. A condition similar to caisson disease in divers has been described in aviators. This condition, called aeroembolism, is due to the liberation of nitrogen bubbles in the blood and tissues during rapid ascent to high altitudes. It has been found that the condition can be prevented if 100% oxygen is breathed during a 30 min. period prior to the ascent.

The oxygen requirements of parachutists leaping from high altitudes have been studied and special devices developed to insure an adequate supply.

Pierce, Palmer Eddy (1865-1940), retired U.S. brigadier general, was born in Savanna, Ill., Oct. 23 and was graduated from the United States Military academy in 1891. He served in the Spanish-American War in 1898 and in the Philippines (1899-1901), then returned to the military academy as assistant professor of philosophy. He was named a member of the army general staff in 1916, serving there until the United States entered the World War in 1917, when he was appointed to the War Industries board to represent the secretary of war. Later he became a member of the secretary's war council. He went to France in May 1918, in command of the 54th Infantry brigade of the 77th division and saw active service.

He received the Distinguished Service medal from congress and was made a Companion of the Bath by the British. He entered the legal department of the Standard Oil Company of New Jersey in 1920 and was named assistant to the president in 1929. After his retirement in 1933, he interested himself in Pan American affairs. He died in New York city, Jan. 17.

Pierlot, Hubert (1883-), Belgian statesman. He was minister of interior in the cabinet of Broqueville in 1934, held the same office in the Theunis cabinet in 1934-35, and was minister of agriculture (1937-38) in the Jan-son cabinet. In Feb. 1939 he became prime minister. His cabinet weathered all storms until Jan. 5, 1940, when he submitted his resignation to the king but was immediately commissioned to form a new government. In May the German invasion forced Pierlot to move his government to France, where he condemned the unconditional surrender of King Leopold. After the French surrender Pierlot fled to Barcelona, Spain and thence to London, where he arrived Oct. 22 from Lisbon after escaping German planes. Here he established his government-in-exile.

Pigs: see HOGS; LIVESTOCK.

Pineapples. A short crop of only 8,000 boxes was reported in 1940 from Florida, the only commercial

pineapple-growing area in the United States. The 1939 Florida crop of pineapples was 15,000 boxes, and the ten-year (1929-38) average was 14,250 boxes. Receipts of pineapples in the United States from Hawaii, Cuba and Mexico increased substantially in 1940. Pineapple shipments to the United States for the fiscal years ending June 30, 1940 and 1939, together with their value, are as shown in the table.

Pineapple Shipments to the U.S., Fiscal Years 1940 and 1939

	1940		1939	
	Quantity	Value	Quantity	Value
Pineapples fresh	107,000 boxes	\$214,000	109,000 boxes	\$198,000
Pineapples canned	499,443,000 lb.	31,822,000	467,983,000 lb.	29,769,000
Pineapple juice	292,842,000 lb.	15,556,000	278,936,000 lb.	15,834,000
Pineapples, prepared or preserved*	191,000 lb.	25,000	†	

*Jan. 1 to June 30, 1940. †Not classified separately.

Hawaiian pineapple shipments to the United States for the 11 months, Jan. 1 to Nov. 30, 1940, were reported by the department of commerce as: fresh pineapple 86,787 boxes valued at \$159,087. Canned pineapple 392,063,573 lb. valued at \$24,998,670. Pineapple juice 315,592,882 lb. valued at \$16,123,029. Pineapple prepared or preserved 302,498 lb. valued at \$36,020. Only very small quantities of Hawaiian pineapple are shipped to foreign countries. Most of Cuban pineapple exports go to the United States and in 1940 bulk shipments were 3,705,000 lb. compared with 1,601,000 lb. in 1939; crates 1,021 in 1940 and 1,275 in 1939. Since 1925 Mexican production of pineapples has increased nearly 350%, practically all exports going to the United States. Mexican pineapple exports in the five years ending with 1939 averaged 41,128 short tons annually, the U.S. department of agriculture reported. (S. O. R.)

Pittman, Key

(1872-1940), U.S. senator from Nevada, was born in Vicksburg, Miss., Sept. 19, and received his education from private tutors and in the Southwestern Presbyterian university at Clarksville, Tenn. He began the practice of law in Seattle, Wash., in 1892. In 1897 he went to Alaska, worked as a miner for two years and became first district attorney of Nome, in which office he fought to protect the rights of miners. In 1901 he left Alaska and settled in Tonopah, Nev., where he practised law. He was elected to the senate in 1912 to fill an unexpired term and was re-elected five times, the last in 1940. He became chairman of the committee on foreign relations in 1933.

He was opposed to the participation of the United States in foreign wars, but believed that the nation should not isolate itself completely from the rest of the world. As a delegate to the London Economic conference in 1933 he obtained an agreement for stabilizing the production and the price of silver. At the time of his death in Reno, Nev., Nov. 10, he was president pro tem of the senate.

Pittsburgh, a city in southwestern Pennsylvania, ranked tenth among the cities of the United States in the 1940 census, with a population of 671,659; it has an estimated area of 54,295 sq.mi. The metropolitan district of which Pittsburgh is the centre is composed of some 130 cities or boroughs, one next to the other, making a contiguous population of 1,954,000.

The annual Carnegie Institute International Art exhibit in 1940 was replaced by a Survey of American Painting, with the work of almost every American painter of note of the past 270 years represented. Seven Pittsburgh artists had paintings in the contemporary section; in "retrospect," were hung the works of a number of well-known Pittsburgh artists of earlier days: David

C. Blythe, John Alexander, Chester Harding and John Kane.

The Pittsburgh Housing authority nearly completed its two low-cost housing projects in the upper Hill district; many of the houses were occupied. At Bedford Dwellings there was space for 800 families; in Terrace Village No. 1 and Terrace Village No. 2 approximately 3,000 families will find moderately priced, up-to-date housing. The project, one of the most elaborate in the country, cost \$17,300,000, one-third of which paid the wages of some 1,500 workmen. Toward the close of the year the authority turned its attention to two new plans, one to house 240 families on the north side, and the second, on the south side, to house 620 families.

An important step in making Pittsburgh still more accessible to markets was the completion of the 160-mile super-highway to Harrisburg. The Pennsylvania turnpike, by eliminating steep grades and sharp curves, diverted a large amount of motor truck traffic to Pittsburgh that formerly avoided the Pennsylvania mountains. Within the city the Water street development, a \$3,000,000 traffic by-pass, completed in 1940 along the banks of the Monongahela river, greatly lessened traffic tie-ups in the Golden Triangle. Another traffic bottleneck at the beginning of Bigelow boulevard was scheduled to be eliminated by a grade separation project begun near the close of the year.

Stimulated by the national defence program, Pittsburgh made substantial industrial gains over the marked business improvement of 1939. Industrial electric power sales and Monongahela river tonnage figures were the highest on record, and pig iron production reached the highest point since the peak year of 1929. Retail trade improved 13% over the previous year. During the first 11 months of 1940, the aggregate pay rolls of manufacturing concerns were 28.3% greater than in the first 11 months of 1939. The general business index (based on the 1923-25 average) was 117, an improvement in one year of 23.9%. (J. G. Bo.)

Pius XII

(1876-) was elected the 262nd pope on March 2, 1939. Born in Rome, Eugenio Pacelli was ordained priest in 1889; entered the papal secretariat of state in 1901; was consecrated archbishop of Sardes in 1917; was named apostolic nuncio to Bavaria the same year, and nuncio to Germany in 1925; was created cardinal in 1929; became secretary of state under Pius XI in 1930.

Speaking on the first anniversary of his coronation as pope, he declared that the first year of his pontificate had seen developments sufficient to fill a whole century in the normal history of

THE FIRST MOTION PICTURE of a Pope addressing an ecclesiastical body of the Vatican, released Feb. 15, 1940, showed Pius XII discussing international peace before his advisory board in the Academy of Science

mankind. The statement was even more true for the second year of his reign. As in 1939 he strove up till the last moment to prevent the war, and as in December of that year he issued his five point program for a "just and honourable peace," so in 1940 he strove through every moral and diplomatic channel to stem the spread of the war and to promote peace.

In the course of 1940, Pope Pius made 28 appeals, on major occasions, in behalf of a just peace. These were all based on fundamental principles. In his letter to President Roosevelt, Jan. 10, he said that only those who unite high political power with a "clear understanding of the voice of humanity, along with a sincere reverence for the Divine precepts of life" will be able to "discern the path that should be followed." Addressing the cardinals on March 12, he stated: "Peace which is supported by cognizance of God . . . is the longing and wish of our soul." The following day he declared: "Peace on the indispensable basis of justice cannot be reconstructed without charity." On Easter Sunday he denounced the violation of treaties, condemned bombing of civilian populations and appealed for the restoration of right order.

His most stirring declaration was uttered on Dec. 24, when he gave the "indispensable prerequisites" for a new order: triumph over hate and renunciation of the systems and practices that promote hatred; triumph over mistrust, which renders impossible the realization of any sincere agreement; triumph over the principle that utility is the basis of law and right, for this destroys international relations; triumph over an unbalanced world economy, a triumph which would lead to granting every state the medium necessary for insuring the proper standard of living for its own citizens of every rank; triumph over the spirit of cold egoism which leads to the violation of the sovereignty of states and the liberty of their citizens.

Pope Pius linked his addresses to his appeals to God. He set aside the month of May 1940 as a period of intensive prayers for Catholics throughout the world and particularly for the children. Again, he appointed Nov. 24 as a day of public prayer throughout the world, for the intention that "peace may be restored in justice, and all peoples be united as brothers."

Directly or indirectly, many of his utterances were interpreted as denunciation of the principles motivating the axis powers. He pledged his moral support to the Low Countries and Luxembourg and consoled with France after the German invasion. On June 5, he sent a personal letter to Mussolini begging that Italy be kept out of the war. It was understood that he protested to Berlin against the persecution of Catholics in occupied Poland on Feb. 16, and it was reported that on March 11, at the audience granted von Ribbentrop, he expressed disapproval of nazi policies. His request on Dec. 3 for a truce on Christmas was not officially granted, but Germany and Great Britain both abstained from air raids.

An immense amount of relief work was accomplished by the pope in quiet ways, such as the distribution of relief in the stricken countries, assisting of refugees, securing information about missing persons in the war areas, reuniting families, obtaining help for war prisoners, etc. (See also ROMAN CATHOLIC CHURCH; VATICAN CITY STATE.) (F. X. T.)

Plasma: see CHEMOTHERAPY; MEDICINE; SURGERY.

Plastics Industry. The use of plastics was, in 1940, on the increase. Because of the war, it was impossible in 1940 to obtain even approximate figures on the volume of plastics produced in Europe, but it is well known that plastics in great variety and volume were being utilized in all of the belligerent countries.

It can be safely estimated that the 1939 world production of plastics was upwards of 425,000,000 lb.

Production of cellulose derivative plastics in the United States during 1939 was 34,170,000 lb.

The United States production of synthetic resins, excluding alkyds, was 136,560,000 lb. The distribution of all plastics was approximately as follows:

Phenol-formaldehyde	29.0%	Vinyls	7.0%
Cellulose acetate	26.0%	Casein	5.0%
Cellulose nitrate	20.0%	Acrylic and methacrylic	2.0%
Urea-formaldehyde	11.0%	Styrene	0.30%

In 1940, much plastic material was used for military purposes, some of the applications being as follows: Cellulose acetate: transparent windows, flexible tubing, gunstocks, gas mask windows and visors, aircraft fairings, ammunition chutes in aeroplanes, and helmets. Methyl methacrylate: transparent windows for aeroplanes and gas masks. Styrene and styroflex: electrical insulation. Polyvinyl chloride (mostly in Germany): radio dial pipes for corrosive liquids, impregnant for gas mask fabrics, and gaskets. Phenol-formaldehyde: for gas mask containers and mouth pieces, small propellers, substitute for aluminium, automobile doors, helmets and heavy-duty bearings. Doubtless there were other uses in Germany about which one can only guess.

Great Britain and Germany instituted government control over the sale and use of plastics. In the United States the government established licensing requirements for the export of optically clear transparents.

Cellulose acetate moulding powder and sheeting continued to replace cellulose nitrate plastics, the ratio being about three to two. Marked advances in moulding technique of both the compression and injection types contributed to the increased use of cellulose acetate and other moulding powders. Complete instrument panels could in 1940 be injected at the rate of one per minute. The use of cellulose acetate (as well as other plastics) in automobiles continued to progress, one car using plastics in 89 separate places.

A new cellulose derivative, namely cellulose acetate-butyrate, was introduced in 1940, its advantage being relative water insensitivity, causing decreased warpage. It has found application in taillight lenses, horn buttons, instrument panels with or without metal inlay, substitute for reed seating in furniture and for arch supports in shoes.

Phenol-formaldehyde, especially laminated, was used in many new places and in larger volume in old fields, such as heavy bearings, ball bearing containers, kitchen utensils, radio cabinets, window sills in railroad cars, refrigerator doors and sliding door frames and rails in large commercial refrigerators. A new development not yet ready for commercial production was that of laminated automobile trunk doors.

Styrene found use in door knobs, toilet sets, bottle closures and refrigerator fittings. Styroflex (thin oriented styrene) was used as packaging material and for electrical insulation.

Methyl methacrylate as indicated above was almost universally substituted for glass in both commercial and military aeroplanes. Other new uses are moulded toilet sets, door knobs, furniture, pipe stems, cosmetic boxes, jewellery boxes, refrigerator hardware, gasoline pump dials, cutlery handles, novelty jewellery, and display fixtures and signs.

Nylon continued to enjoy a growing market in hair brushes and tooth brushes, and found new application in industrial brushes where its great wear resistance presents a real economy.

Vinylite, a copolymer of vinyl chloride and vinyl acetate, found application as house numbers, battery separators, radio dials, bottle cap liners and raincoats. In a soft elastic form, it was used as a leather substitute for belts, also for suspenders, garters and shoe trimmings.

Vinylidene chloride, a new plastic, was used in the form of filament or strands as seats in cars and household furniture and for rope.

Cast phenol-formaldehyde in bright colours had a new lease of life as material for automatic phonograph record players (juke boxes).

Polyvinyl butyral continued as the preferred plastic interlayer for safety glass, receiving practically universal acceptance.

Polyvinyl formal was used for tank linings and, when combined with ethyl cellulose, as an insulating wire coating.

Urea-formaldehyde was used in larger volume for lighting fixtures and in a new type of light which throws the illumination directly below the fixture but shades the eyes of one at a little distance. Very large fixtures 26 inches in diameter, have been made. Other applications are cosmetic containers, sanitary appliances, refrigerator door linings and plywood adhesives.

Finally it may be said that the consuming public became increasingly plastic-minded in 1940 even though about 50% of plastic production went into industrial uses where it was not always evident to the consumer. Such uses were machine parts, factory and electrical equipment. (See also CHEMISTRY, APPLIED; DENTISTRY; INDUSTRIAL RESEARCH; PAINTS AND VARNISHES; RAYON; RUBBER AND RUBBER MANUFACTURE; TEXTILE INDUSTRY.) (H. W. PA.)

Platinum. No data have been published on the Russian platinum output since 1926, and data on exports.

re incomplete; since these figures vary widely from year to year, the world totals fluctuate accordingly, and do not represent a true picture of the industry, as it is not known how much of the Russian shipments is from current production and how much from accumulated surplus stocks from previous years. The world supply in 1938 is estimated to have been almost 400,000 oz.

From 12,500 oz. in 1929, the Canadian production increased to 161,300 oz. in 1938, dropping to 148,900 oz. in 1939. The next largest producer is Colombia, with an output which dropped in the past few years from 55,000 oz. (crude) to less than 30,000 oz. in 1937, but recovered to 39,100 oz. in 1939. The fourth largest producer is South Africa, which had a high figure of 45,500 oz. in 1930, dropped heavily, but rose to 47,100 oz. in 1939. The United States output stands fifth in the list, the yield since 1935 having been boosted above the previous level by a new placer deposit in Alaska. In 1939 the recovery of by-product platinum was 5,270 oz. and of placer crude 35,060 oz., the exact platinum content of which is unknown. (G. A. Ro.)

Plums and Prunes. The 1940 prune crop varied widely in the five states of principal production, the United States department of agriculture reported. In California and Michigan, where plums are grown chiefly for fresh use, the crop was 2% under average, while in Idaho it was 6% below average. Eastern Washington and western Oregon reported production above average while in the more important areas of western Washington and western Oregon, where plums are grown mostly for drying, the yield was extremely light. In Yugoslavia,

Table I.—Quantities of Plums used Fresh, Canned and Dried

Used Fresh, in Tons, Fresh Basis			
State	1940	1939	1929-38
Idaho	22,000	22,300	17,400
Oregon	17,000	20,100	10,900
Washington	10,200	15,800	14,210
Total, three states	49,200	58,200	42,510
Canned, in Tons, Fresh Basis*			
Oregon	10,700	25,700	14,450
Washington	5,100	6,800	4,540
Total, two states	15,800	32,500	18,990
Dried, in Tons, Dry Basis†			
California	196,000‡	185,000	198,900
Oregon	2,600	26,600	24,000
Washington	100	1,800	3,450
Total, three states	198,700	213,400	226,440

*Includes small quantities for cold packing. †The drying ratio in Washington and Oregon ranges from 3 to 4 lb. of fresh fruit to 1 lb. dried; in California the drying ratio is approximately 2½ lb. of fresh fruit to 1 lb. dried. ‡In addition 1,000 tons (dry basis) were not harvested because of market conditions.

Foremost European producer, 1940 production was estimated at 13,000 short tons compared with 80,300 tons in 1939, owing to winter killing of trees. United States production and use in 1940, in 1939 and for the ten-year (1929-38) average, as reported by the department of agriculture, are shown in Tables I and II.

Table II.—Plum Production in U.S. in Tons, Fresh Basis

State	1940	1939	1929-38
California	70,000	71,000	61,500
Western Oregon	26,000	140,000	100,700
Eastern Oregon	16,400	13,800	12,880
Idaho	23,000	23,500	17,960
Eastern Washington	14,400	14,300	13,250
Western Washington	2,800	20,000	19,800
Michigan	5,800	6,300	5,390
Total	157,400	288,900	231,480

(S. O. R.)

Pneumonia. In 1940 the chemotherapy of pneumonia continued to be the outstanding topic. The remarkable therapeutic effect of sulphapyridine in the treatment of the various types of pneumococcal pneumonia was corroborated. Sul-

phapyridine has revolutionized the treatment of pneumonia. Perrin Long points out that while serum reduced the death rate of pneumonia by approximately 50%, sulphapyridine has reduced it by 75% or 80%. Whereas it was formerly expected to lose one out of every three patients with pneumonia, it was expected in 1940 to lose not more than one out of every 14 or 15 cases.

Because of certain toxic symptoms referable to sulphapyridine, chemists have been striving to produce a modification of the drug which would possess all of its therapeutic advantages without the toxic disadvantages. A close approach to this desideratum was found in sulphathiazole. Sulphapyridine not only causes nausea and vomiting in many patients, but also produces mental depression and sometimes a grave effect on the white or red corpuscles in the blood. Occasionally sulphapyridine produces crystalline precipitates in the urinary tract which form small stony concretions and excite acute inflammation in the kidneys and bladder. Sulphathiazole is distinctly less toxic than sulphapyridine, but just as effective in combatting pneumococcus infections. For example Rake and his co-workers showed that in rats, sulphapyridine is twice as toxic as sulphathiazole; furthermore, in monkeys receiving daily doses, sulphapyridine is more toxic than sulphathiazole as shown by damage in the urinary tract and by loss of weight and decrease in the number of leukocytes. All authorities agreed that nausea and vomiting are much less frequent with sulphathiazole than with sulphapyridine.

Sulphathiazole is absorbed more rapidly than sulphapyridine from the gastrointestinal tract, and is excreted more rapidly and completely in the urine.

Furthermore it was generally agreed that the reduction in death rate is almost identical with the two drugs. The sudden drop in temperature which occurs within 24 hours in a large proportion of the sulphapyridine cases is not quite so striking in the case of sulphathiazole.

Another sulphonamide derivative has been introduced—sulphadiazine. This agent has a powerful inhibitory effect on not only the pneumococcus and streptococcus, but on the staphylococcus and Friedlander bacillus as well. Sulphadiazine had not yet in 1940 been released for general use by the medical profession, but experience already obtained in several large university hospitals seems to indicate that sulphadiazine is even less toxic than sulphathiazole and at the same time has a wider range of germicidal effect.

Chemotherapy.—Remarkably few deaths were reported from the use of chemotherapeutic agents in the treatment of pneumonia. Undoubtedly from time to time a fatal reaction will be reported in some person who is hypersensitive to the drug. (See also CHEMOTHERAPY; EPIDEMICS AND PUBLIC HEALTH CONTROL; MEDICINE.)

Poland. The area of Poland prior to the German invasion on Sept. 1, 1939 was about 150,820 sq.mi.; the population was estimated Jan. 1, 1939 as 34,900,000. On Sept. 29, 1939, after the conquest of the country was virtually completed, Germany and the U.S.S.R. partitioned Poland and set up a new

JEWS IN GERMAN-OCCUPIED POLAND must wear yellow triangles sewed on the backs of their coats as marks of identity

boundary which, running from north to south, roughly follows the Pissa, Bug and San rivers. The Germans then divided their territory into two sections; one, including the provinces of Pomorze, Posen, Upper Silesia and Lodz, was directly annexed to the Reich; the rest was constituted as the Gouvernement General of Poland, under German administration, with Cracow as the capital.

History.—During 1940 a welter of rumour issued from the German- and Russian-occupied sections of Poland, which was cut off from free communication with the outside world. The Allied governments repeatedly charged gross maltreatment of Polish civilians at the hands of both Russians and Germans, as did the Polish government-in-exile (in its *Black Book* published at Paris April 17, 1940), the Roman Catholic church, and various Jewish organizations. Many of these charges were authenticated. That there was widespread misery and hunger in the former republic was scarcely deniable.

From Berlin itself came official announcements which indicated that the nazis intended to suppress all Polish national life indefinitely. On Jan. 8, 1940 the first of numerous German-language schools was opened in the Gouvernement General. Two weeks later Governor General Hans Frank ordered all Poles to give up their radio sets and extended the labour conscription laws to include youths between 14 and 18 years of age. Confiscation of factories, forests and farmlands in former Polish territory (except the Gouvernement General) was decreed by Goering on Feb. 19, and in August the Reich council of ministers imposed a "social equalization tax" of 15% on the incomes of all Poles, in addition to the already-existing German income tax. Dispatches passed by the German censor told of scores of thousands of Polish agricultural labourers—5,000 daily from Warsaw alone—being brought to Germany to work German farmlands. In December Berlin announced that most Polish prisoners of war had been released but were engaged in civil employment.

News from Russian-held Poland was scarcer, but there were several reports that whole blocks of Polish populations had been transplanted to Siberia and Kazakh S.S.R. The Catholic church charged that religion was suppressed in Russian Poland.

The Government-in-Exile.—Fleeing before the German advance into France, Poland's exiled government vacated its provisional capital at Angers in June and moved to Bordeaux, then London. On Aug. 5 Premier Wladislaw Sikorski signed a military agreement with Great Britain for a joint prosecution of the war. On Oct. 9 Wladislaw Racziewicz, the Polish president in

exile, signed an agreement with Eduard Beneš, expatriate president of Czechoslovakia, pledging mutual support and friendship.

Police. The turn of the decade found police forces everywhere revising their patterns in order to adapt themselves to war. In many parts of Europe and Asia, police were virtually absorbed into the military establishments and became integral parts of national defence. Much the same was true, though to lesser extent, of Great Britain, Australia and Canada. Even in the neutral nations of North America, the advent of 1940 saw either a tightening of central controls over police, or major changes in interforce relationships. The police of England, Wales and Scotland, heavily engaged in "air raid precautions" found themselves burdened with still further responsibilities in assisting their civil populations to meet unrestricted air warfare in non-military zones. The threat of invasion also required large-scale planning of new civil defence arrangements, while the nightly black-outs produced crime and accident hazards of a kind never before experienced. Canada, far removed from the theatre of war, nevertheless took anticipatory action intended to facilitate the mobilization of police at points threatened by civil disorder or thrown into confusion by military conflict. In the United States similar steps were taken. New York, New Jersey, Virginia and Connecticut adopted state-wide programs for mobilizing police. As the year closed, it appeared probable that other states, with police systems no less decentralized, would also act to assure an orderly transfer of police strength to any threatened point. These departures were significant because they were initiated by the governors without legislative action and were realized only because of the ready acquiescence of the local police concerned. Thus a wholly novel type of central control over police operations in emergencies was created.

There were no important changes in the numerical strength of municipal police forces. Latest figures (for 1939) covering 2,750 cities, towns and villages, are summarized from the *Uniform Crime Reports* in Table I. Latest available data on costs of

Table I.—Numerical Strength of Municipal Police in U.S.

Population Groups of Cities	Number of Forces Filing Returns	Population Represented	Number of Police per Thousand of Population
Group I—over 250,000	37	29,695,500	2.10
Group II—100,000 to 250,000	57	7,850,312	1.47
Group III—50,000 to 100,000	103	6,893,474	1.36
Group IV—25,000 to 50,000	191	6,650,168	1.21
Group V—10,000 to 25,000	568	8,765,546	1.08
Group VI—Under 10,000	1,794	8,837,885	1.11
Totals	2,750	68,692,885	1.65

operation and maintenance (1937) for police in cities over 100,000 population (Table II) showed a substantial increase over the preceding year. A new high level for the depression cycle was thereby reached and one which approached closely to the all-time high recorded early in the decade. There were numerous indications between 1938 and 1940 that the all-time record of per capita expenditure for police had been exceeded. Crime cleared by arrest in 1939 showed a slight falling off in this form of police efficiency, as measured against the peak year of 1938 in such major crimes as murder, aggravated assault and robbery. As usual, police cleared more crimes against the person, ranging from 87.4% (for murder and non-negligent manslaughter) down to 76.5% (for aggravated assault). Arrest clearances of crime against property again reflected a less favourable situation than in the case of crimes against the person, ranging from 24.4% for

Table II.—Per Capita Cost of Operation and Maintenance Charges for Municipal Police, 1933-37, in U.S.

Population Groups of Cities	Per Capita Cost of Police				
	1937	1936	1935	1934	1933
Group I—All cities over 500,000	6.34	6.06	5.84	5.65	5.69
Group II—All cities 300,000 to 500,000	4.11	3.71	3.65	3.60	3.79
Group III—All cities 100,000 to 300,000	3.05	2.83	2.71	2.66	2.60

auto theft (an increase from 22.3% in 1938) up to 41.9% for robbery. Table III summarizes the record of crimes cleared in 1939, in 1,214 cities having a total population of 39,147,097. There was a percentage decline from 1938 in clearances for all crimes except negligent manslaughter and auto theft.

Table III.—Per Cent of Crimes Cleared by Arrest, in U.S. Cities, 1939

Murder and Non-Negligent Manslaughter	Negligent Manslaughter	Rape	Robbery	Aggravated Assault	Burglary, Breaking or Entering	Larceny, Theft	Auto Theft
87.4	87.7	81.8	41.9	76.5	34.0	25.1	24.4

With the establishment of rudimentary state forces in Florida and Wisconsin, every state in the union was supporting a state police body of some description.

An important change in federal police organization occurred when President Roosevelt by executive order transferred the immigration border patrol from the department of labor, with which it previously had been articulated, to the department of justice. Some professed to see evidence of a trend towards consolidating others of the far-flung and highly varied federal police systems under the administrative direction and control of the attorney-general.

Largest single development in federal police jurisdiction was the addition of several hundred men to the numerical strength of the federal bureau of investigation. Announced purpose was to make it possible for the FBI to enlarge the scope of its investigations into sabotage, espionage and subversive activities, especially delegated to them by executive order of the president.

England and Wales.—The rise in the numerical strength and gross expenditures of the police forces, previously noted for each year since 1934-35, was continued during the year 1938-39, as shown in Table IV. Increasing emphasis on police resources as a measure of national defence was responsible for much of the increase, though the reports of His Majesty's inspectors of constabulary for the year ended Sept. 29, 1939, expressed regret that it was not until the outbreak of hostilities on Sept. 1 of that year that many local authorities accepted the fact that grave dangers impended. Many chief constables stated that the closing of the schools and the difficulties occasioned by evacuation tended to increase juvenile crime, though there was nothing in 1940 to indicate that the problem was a serious one. The war also impeded the construction of new police buildings, and in some instances training programs were curtailed. The latter was viewed with some concern, lest war conditions ultimately would impair the effectiveness of police through neglect of methods and procedures of established value.

A decline in the numerical strength of the police of the metropolitan police district, previously noted for 1937-38, was further extended into 1938-39, with the average daily strength dropping by about 1% to 18,428. Thus the London metropolitan police

Table IV.—Numerical Strength and Gross Expenditures; Police Forces of England and Wales, 1939-35

	Numerical Strength	Gross Expenditure
1938-1939	63,594	£25,840,470
1937-1938	62,804	25,000,020
1936-1937	60,966	23,497,830
1935-1936	60,257	22,751,377
1934-1935	59,988	22,785,323

shared with New York city in 1940 the distinction of being the world's largest local police force.

There was a considerable increase in the use of wireless communication to patrol cars, with resulting improvements in police service.

Activities of the I.R.A. (Irish Republican army) in the Midlands greatly increased the burden of repressive activity for the police.

Another dislocation caused by the war was occasioned by police officers and constables being called to the colours. In addition to these necessary replacements, a police war reserve was set up, though difficulties were being experienced in recruiting suitable men for it in industrial areas where high wages were in effect. There seemed to be no promise that this situation would be improved in the near future; rather the prospect was that it would be aggravated.

General.—The clash of arms was not conducive to international conferences on police techniques. However, the International Association of Chiefs of Police (in which U.S. and Canadian memberships heavily predominate) held its 47th Annual Police congress at Milwaukee in Sept. 1940. Greatest interest was centred upon the possible future status of local and state police pension funds under pending amendments to the (U.S.) Social Security act. These would include police among the groups subject to compulsory insurance. Various measures were adopted to assure that the viewpoint and interests of police were adequately presented in the event that any such amendments actually moved towards enactment. Another matter eliciting much discussion at the police congress was the possible effect of the (U.S.) Selective Service act of 1940 in diverting trained police into active military service.

At a civil defence conference held in Washington Nov. 15-16, 1940 under the general auspices of the International Association of Chiefs of Police, the state-wide police mobilization plans initiated in four of the eastern states were commended to the attention of state and local governmental executives in other parts of the union. Formal request was also made to the government of the United States for financial aid to states, counties, towns, cities and villages in adding to their resources of police man power and equipment. Thus state and local police administrators, heretofore opposed to federal intervention in local police affairs, invited an enlargement of federal administrative controls.

Largest single development in police techniques was the adaptation of radio frequency modulation to police broadcasts. Indications were that with extension of the new facilities radio telephone communication between police stations and patrol cars, often difficult to conduct on a satisfactory basis in congested areas, would be materially improved. (See also CRIME; CRIME DETECTION; FEDERAL BUREAU OF INVESTIGATION.)

Polo. The National Open championship, most important event of the U.S. season, was won by the Aknusti team of Gerard Smith, Robert L. Gerry, Jr., Elbridge T. Gerry and Alan L. Corey, Jr. Great Neck, runner-up in the open, came back to defeat Aknusti in the Waterbury Cup final, most important handicap event of the year. Great Neck played with George H.

Mead, Jr., J. Peter Grace, Jr., S. B. Iglehart and Robert E. Strawbridge, Jr. Iglehart's Great Neck team also won the National Twenty Goal, although Gerald Dempsey and E. N. Carpenter played in place of Mead and Strawbridge in this event.

The year's Inter-Circuit and Twelve Goal championships were played in Cleveland, the former event being won by the Blue Hill Farms team of Philadelphia while the National Twelve Goal was won by the Gates Mills team of Ohio. The National Intercollegiate championship was won by Yale university.

Because of the war, there were no international matches played during 1940, but there were many charity matches played throughout the country for the Red Cross and other war relief causes and these were enthusiastically received by press and public alike.

Elbridge T. Gerry became the new chairman of the United States Polo association, governing body of the game, replacing Robert E. Strawbridge, Jr. (R. F. K.)

Poore, Benjamin Andrew (1863–1940), U.S. soldier, was born in Centre, Ala., June 22, and was graduated from the United States Military academy in 1886, from the Infantry and Cavalry school in 1893 and from the Army War college in 1909. He rose through various grades until he reached the rank of major general in 1925. He saw service in the Philippines and in China and served in the World War of 1914–18, participating in the Aisne-Marne, St. Mihiel and Argonne offensives of 1918. He retired in 1927. He had received the U.S. Distinguished Service medal and Distinguished Service cross, the French Croix de Guerre with palms, and the Italian Croce di Guerra al Merito. He died in Fitchburg, Mass., Aug. 27.

Portal, Sir Charles Frederick Algernon

(1893–) was appointed early in Oct. 1940 to succeed Sir Cyril L. N. Newall as chief of the British royal air force. He was educated at Oxford and after a brief period as a motorcycle racer joined the British army during the World War of 1914–18 as a dispatch rider. Finding these duties none too exciting, he joined the air force and advanced to the rank of colonel. After the armistice he stayed with the force and in 1937 became director of organization for the air ministry. After the outbreak of war in 1939 he was appointed head of the bomber command and thus directed the series of raids against nazi bases in France, Norway, Belgium and Holland which probably forestalled the expected invasion of Britain by Germany in 1940. His excellent planning and execution of raids led to his appointment Oct. 4, 1940 as chief of the air staff.

Porto Rico: see PUERTO RICO.

Portugal, a republic of western Europe, forming part of the Iberian peninsula and bounded on the N. and E. by Spain and on the S. and W. by the Atlantic ocean. Area (including Azores and Madeira) 35,670 sq.mi.; pop. (est. Dec. 31, 1938) 7,460,000. Chief towns: Lisbon (cap. 594,300); Oporto (232,280). President: Gen. Antonio Carmona; language: Portuguese; religion: Christian (mainly Roman Catholic).

History.—Interest during 1940 centred around the celebrations of Portugal's double centenary (1140: foundation of Portugal as an independent nation; 1640: recovery of national independence),

BOYS OF THE PORTUGUESE "MOCIDADE" youth legion drilling in 1940. Membership for boys between 10 and 14 is compulsory

at the chief functions of which Great Britain was represented by H.R.H. the duke of Kent. Inaugurated in Lisbon on June 2, held in every town and village throughout the country and brought to a close on Dec. 2, they were shorn of some of their brilliance and animation by the European war, which in particular prevented many foreign delegates from attending the Congress of the Portuguese World, held at Lisbon, Coimbra and Oporto during July.

For the 12th successive year the national budget was balanced. The new estimates provided for the influence of war conditions, notably for a diminution in import duties, but in most respects it was hoped that prewar levels would be maintained. The government decreed the optional conversion of the external debt, amounting to a total sum of about £27,000,000 sterling.

On May 7 a concordat was signed between Portugal and the Holy See, providing, among other things, for the restitution of sequestered church property, the establishment of religious instruction in schools and the indissolubility of the marriage bond. Bishops were to be appointed by the Holy See, but only after its previous consultation with the government. The church might freely practise religious acts both in private and in public.

As one result of the concordat, the Portuguese diplomatic mission at the Vatican was raised to an embassy. Dr. Carneiro Pacheco, minister of education, being appointed first ambassador. This appointment led to various cabinet readjustments, the prime minister, however, retaining the portfolios of war and foreign affairs.

The continued cordiality of Portugal's relations with Spain was symbolized in a number of visits on either side and given further expression by the issue, in May 1940, of a joint declaration of mutual confidence; by the signing in July of a protocol to the Spanish-Portuguese treaty of March 1939; and by the Anglo-Spanish-Portuguese agreement (July 24) facilitating the purchase of Portuguese and colonial goods by Spain through the Anglo-Spanish clearing office.

(E. A. P.)

Education.—Elementary (1937) schools 7,890; scholars 734,922; secondary (1936–37) schools 45; scholars 18,055; universities (1936–37) 3; students 5,871.

Banking and Finance.—Revenue, ordinary (est. 1939) 2,029,200,000 escudos; expenditure, ordinary (est. 1939) 2,019,800,000 escudos; public debt (1938) 7,229,300,000 escudos; notes in circulation (Aug. 31, 1939) 2,230,000,000 escudos; gold reserve

(Aug. 31, 1939) 920,000,000 escudos; exchange rate: 110 escudos = £1 sterling.

Trade and Communications.—External trade (merchandise): imports (1938) 2,284,337,000 escudos; (Jan.-Aug. 1939) 1,275,720,000 escudos; exports (1938) 1,140,943,000 escudos; (Jan.-Aug. 1939) 786,770,000 escudos; re-exports (1938) 412,436,000 escudos. Communications and transport (Dec. 31, 1937): roads, first and second class 8,858 mi.; railways, open to traffic 2,187 mi.; motor vehicles licensed: cars 34,442; commercial 11,410; cycles 4,536; shipping (June 30, 1938) 261,100 gross tons; launched (July 1938-June 1939) 2,100 gross tons.

Agriculture and Minerals.—Production 1938 (in metric tons): wheat 430,100; maize 296,200; wine 10,955,000 hectolitres; coal 308,000; rye 102,900; oats 94,800; rice (1937) 84,900; barley 39,000; potatoes (1937) 596,100; olive oil 36,000; sea fisheries 224,400.

Portuguese Colonial Empire. Total area (approx.) 839,506 sq.mi.; total population (est. Dec. 31, 1937) 16,790,000. Certain essential statistics of the colonial possessions of Portugal, including the mother country itself, are given in the table.

History.—President Carmona's 1939 colonial tours, together with the rapid reconstruction going on in the colonies, were bringing the empire into the limelight at home. Part of the general Congress of the Portuguese World held in July (*see* PORTUGAL) took the form of a self-contained colonial congress, to discuss Portuguese colonial problems, including those of research in anthropology, medicine, etc., colonization, population (especially in Angola and Mozambique) and economic life. The transactions of the congress were in 1940 being published in two volumes.

In each of the colonies, during 1940, financial equilibrium was maintained. Mozambique, in which for the first time an income tax was to be levied, was particularly prosperous. All the colonies were to pay a special defence tax; large allocations were also being made for road works and other development schemes. Gen-

eral Tristão de Bettencourt, a distinguished colonial expert, was appointed governor general of Mozambique.

The Patronage of the East, placed in jeopardy by the Separation law of 1911, was fully restored and consolidated in the concordat of May 1940.

A full census of the Portuguese empire was to be taken for the first time during 1940. (E. A. P.)
